Volume 21 • Issue S4 • JUNE 2021

American Journal of TRANSPLANTATION

THE OFFICIAL JOURNAL OF

WILEY

American Transplant Congress
Meeting Office
1120 Route 73, Suite 200
Mount Laurel, NJ 08054
Telephone: 856-439-0500
Fax: 856-439-0525
Email: www.atcmeeting.org

Table of Contents

All Live Broadcast Programs are in Eastern Time

2:45 pm – 3:00 pm	**Welcome**
3:00 pm – 5:30 pm	**In-Depth Symposia**
5:30 pm – 6:00 pm	**Break**
6:00 pm – 8:00 pm	**Networking Event**

All Live Broadcast Programs are in Eastern Time

Welcome
2:45 pm – 3:00 pm

In-Depth
Kidney
3:00 pm - 5:30 pm

Living Donor Selection Where to Draw the Line
Moderators: Didier Mandelbrot, MD, UW Health, Medical Director of Kidney Transplantation, Madison, WI, USA, Carrie Schinstock, Medical Doctor, Mayo Clinic, Dr., Rochester, MN, USA

3:00 pm **The Landscape of Live Donation/ Overall Risk Assessment**
Vineeta Kumar, MD, University of Alabama At Birmingham, Professor of Medicine, Endowded Professor in Transplant Nephrology, Birmingham, AL, USA

3:10 pm **Surgical Issues**
Lloyd Ratner, MD, MPH, Columbia University, Professor of Surgery; Director - Renal & Pancreatic Transplantation, New York, NY, USA

3:20 pm **Kidney Stones**
David Serur, MD, HMHN, Medical Director, Kidney Transplantation, Hackensack, NJ, USA

3:30 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **Assessment of Kidney Function**
Andrew Rule, M.D., Mayo Clinic, Nephrologist, Rochester, MN, USA

4:40 pm **Diabetes and Obesity**
Hassan Ibrahim, Houston Methodist Hospital, Houston, TX, USA

4:50 pm **Hypertension**
Mona Doshi, MBBS, University of Michigan, Ann Arbor, MI, USA

5:00 pm **Live Video Question and Answer**

In-Depth
Liver
3:00 pm - 5:30 pm

Pushing Past the Limits of LDLT in the US: Programmatic Development
Moderators: Roberto Hernandez-Alejandro, MD, University of Rochester Medical Center, Professor of Surgery, Rochester, NY, USA, Talia Baker, MD, Uchicago Medicine, Director, Liver Transplant Oncology, Chicago, IL, USA

3:00 pm **Altruistic Donation and Social Media in LDLT**
Nazia Selzner, MD PhD, University Health Network, Medical Director LDLT, Tornto, ON, Canada

3:10 pm **Planning for an Adverse Event**
Talia Baker, MD, Uchicago medicine, Director, Liver Transplant Oncology, Chicago, IL, USA

3:20 pm **Robust Training in LDLT, Do We Need to Travel?**
Steven I Hanish, MD, UT Southwestern Medical Center, Assoc Prof of Surgery, Dallas, TX, USA

3:30 pm **Can we Weather the Storm of a LD Fatality?**
James Pomposelli, University of Colorado

3:40 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **Informed (informative) Consent: Giving Support and Avoiding Coercion**
Diane La Pointe-Rudow, ANP-BC DNP FAAN, Mount Sinai Hospital, Director Of Zweig Family Center for Living Donation, New York, NY, USA

4:40 pm **How to Get a LDLT Program Up and Running - A Clinicians Perspective**
Cristiano Quintini, MD, Cleveland Clinic, Director, Liver Transplantation, Cleveland, OH, USA

4:50 pm **How Does LDLT Fit into the New Allocation Model**
James Trotter, MD, Baylor Dallas, doctor, Dallas, TX, USA

5:00 pm **Live Video Question and Answer**

In-Depth

Heart: Lung
3:00 pm - 5:30 pm

Don't Throw Them in the Bucket!!! Tricks of the Trade to Optimize Every Thoracic Donor Offer

Moderators: Shelley Hall, MD, Baylor Univ Medical Center, Chief, Transplant Cardiology, MCS and Adv HF, Dallas, TX, USA, Deborah Levine, MD, University of Texas Health, Medical Director of Lung Transplant, San Antonio, TX, USA

3:00 pm **Donor Optimization: Management of the Organ Donor for Thoracic Organs**
Hannah Copeland, MD, Lutheran Hospital of Indiana/ Indiana University School of Medicine Fort Wayne, Surgical director of heart transplant, MCS, Director of ECMO, Fort Wayne, IN, USA

3:15 pm **Improving Heart Utilization: When Should we put the Heart in a Box?**
Abbas Ardehali, MD, UCLA Medical Center, Professor, Los Angeles, CA, USA

3:30 pm **Ex-vivo Lung Perfusion How I do it?**
Pablo Sanchez, MD, PhD, UPMC Cardiothoracic Surgery, Chief, Division of Lung Transplant, Pittsburgh, PA, USA

3:45 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **DCD Heart Donation: Ready for Prime Time?**
Steven Tsui, MD, Papworth Hospital NHS Foundation Trust, Cambridge, United Kingdom

4:45 pm **DCD Lung Donation: A Diamond in the Rough**
Marcelo Cypel, MD, MSC, FACS. FRCSC, University of Toronto, Associate Professor of Surgery, Toronto, ON, Canada

5:00 pm **Live Video Question and Answer**

In-Depth

Pharmacy
3:00 pm - 5:30 pm

Comprehensive Management in Multi-Organ Transplantation: It Takes a Village

Moderators: Linda Ohler, MSN, RN, CCTC, FAAN, FAST, Vienna, VA, USA, Laura Lourenco Jenkins, Doctor of Pharmacy, CareDx, Inc.; University of Chicago Medicine, Current Medical Science Liaison; former Transplant PharmD, Chicago, IL, USA

3:00 pm **SRTR Outcomes and Multi-Organ Transplants**
Jon Snyder, PhD, Hennepin Healthcare Research Institute, Director of Transplant Epidemiology, Minneapolis, MN, USA

3:10 pm **Allocation of Multi-Organ Transplants & Ethical Implications**
Peter Reese, MD, University of Penn, Philadelphia, PA, USA

3:20 pm **An Alternative Strategy: Sequential Versus Combined Transplantation - Are Two Operations Better Than One?**
Sylvester Black, MD, PhD, Ohio State University, Associate Professor of Surgery, Columbus, OH, USA

3:30 pm **Prepping the Patient: Surgical Sequence & Peri-operative Management of a Multi-organ Recipient**
Richard Daly, M.D., Mayo Clinic, Surgical Director of Heart and Lung Transplantation, Rochester, MN, USA

3:40 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **An Immunologic Perspective: Can the Liver "Tolerate" the Rest?**
Annette Jackson, PhD, Sparks Glencoe, MD, USA

4:40 pm **The Multi-Multidisciplinary Team: Inpatient and Outpatient Coordination of Care for Multi-organ Transplant Recipients**
Gina Jamero, MSN, ACNP-BC, Cedars Sinai Heart Institute, Lead Nurse Practitioner, Heart Transplant/MCS Cardiology, Los Angeles, CA, USA

4:50 pm **Don't Go BKing My Heart: Infectious Complications & Anti-infective Prophylaxis in the Multi-organ Recipient**
Marcus Pereira, MD, MPH, New York Presbyterian Hospital, New York, NY, USA

5:00 pm **Nuances of Immunosuppressive Management in the Multi-organ Recipient**
Tracy Sparkes, PharmD, University of Maryland Medical Center, Transplant Clinical Pharmacy Specialist, Baltimore, MD, USA

5:10 pm **Live Video Question and Answer**

In-Depth

ID

3:00 pm - 5:30 pm

Transplant Infectious Diseases

Moderators: Nicole Theodoropoulos, MD, MS, University of Massachusetts Medical School, Associate Professor, Worcester, MA, USA, Peter Chin-Hong, MD, University of California, San Francisco, San Francisco, CA, USA

3:00 pm **Outbreaks: Nosocomial mold outbreaks (including Candida auris)**
Michele Morris, MD, FIDSA, FAST, University of Miami Miller School of Medicine, Director, Immunocompromised Host Service, Professor of Clinical Medicine, Division of Infectious Diseases, Miami, FL, USA

3:10 pm **Outbreaks: NTM Outbreaks in Transplant Centers**
Arthur Baker, MD, MPH, Duke University School of Medicine, Assistant Professor of Medicine, Division of Infectious Diseases, Durham, NC, USA

3:20 pm **Globalization of Transplant: Evaluation and Management of Hepatitis E after Transplantation**
Nassim Kamar, MD, PhD, -Toulouse University Hospital, Professor of Medicine, Toulouse, France

3:30 pm **Globalization of Transplant: Prevention and management of TB in transplant recipients**
Cybele Lara Abad, MD, University of the Philippines, Clinical Associate Professor, Manila, Philippines

3:40 pm **Live Video Question and Answer**

4:00 pm **Break**

Moderators: Aruna Subramanian, MD, Stanford University Hospital, Clinical Professor of Medicine, Stanford, CA, USA, Sarah Taimur, MD, Mount Sinai Medical Center, Associate Professor of Medicine, Division of Infectious Diseases, New York, NY, USA

4:30 pm **Optimizing the Transplant Candidate: Bacteremia and Ventricular Assist Device: Diagnosis and Management, and Optimal Timing of Transplantation**
Deeksha Jandhyala, M.D., Medical University of South Carolina, Assistant Professor of Medicine, Transplant Infectious Diseases, Charleston, SC, USA

4:40 pm **Pre-lung Transplant Patient on ECMO with Fevers: Diagnosis, Drug Dosing, and Technical Challenges Before and After Transplantation**
Philip Ponce, MD, University of Texas Health San Antonio, Infections in Pre-lung Transplant Patients on ECMO, San Antonio, TX, USA

4:50 pm **What's New & Novel in TID? Rapid Diagnostics: From Culture to ID (Include NGS)**
Kimberly Hanson, MD, University of Utah

5:00 pm **What's New & Novel in TID? Emerging Therapies**
Ghady Haidar, MD, University of Pittsburgh Medical Center, Assistant Professor of Medicine, Pittsburgh, PA, USA

5:10 pm **Live Video Question and Answer**

In-Depth

Other

3:00 pm - 5:30 pm

Using AI and Machine Learning for Organ Allocation Policy Design

Moderators: David Axelrod, MD, MBA, University of Iowa, Professor of Surgery, Iowa City, IA, USA, Peter Friend, MD, University of Oxford, Professor of Transplantation, Oxford, United Kingdom, Daniela Ladner, MD, MPH, Northwestern Memorial Hospital, Chicago, IL, USA

3:00 pm **Predicting Patients at Risk for Leaving the ED Without Being Seen Using Machine Learning**
Nikos Trichakis, PhD, MIT, Associate Professor, Cambridge, MA, USA

3:20 pm **Artificial Intelligence and Machine Learning to Facilitate Decision-making: Provider Perspective**
Héloise Cardinal, MD, PhD, CHUM, Dr, Montreal, QC, Canada

3:20 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **Solving Major Problems in Organ Transplantation with Mobile Health Software**
Eric Pahl, BSE, University of Iowa, Graduate Research Fellow, Iowa City, IA, USA

4:40 pm **Machine Learning and Artificial Intelligence in Healthcare and Personality Emulation.**
Randi Foraker, PhD, Washington University in St. Louis School of Medicine, Associate Professor, Saint Louis, MO, USA

4:50 pm **Utilizing Machine Learning Based Predictions**
Sanjay Mehrotra, PhD, Northwestern University, Professor, Evanston, IL, USA

5:00 pm **Supporting the Future Today in Artificial Intelligence in Organ Transplantation: The UNOS Perspective**
David Klassen, MD, United Network for Organ Sharing, Chief Medical Officer, Richmond, VA, USA

5:10 pm **Live Video Question and Answer**

In-Depth

Other

3:00 pm - 5:30 pm

Racism in Transplantation: Current State and Future Directions

Moderators: Marie Chisholm-Burns, PharmD, MPH, MBA, University of Tennessee Health Science Center College of Pharmacy, Memphis, TN, USA, Andre Dick, MD, MPH, University of Washington School of Medicine Seattle, Seattle, WA, USA, Valeria Valbuena, MD, University of Michigan, Resident Physician, Ann Arbor, MI, USA

3:00 pm **Clinical Care**
Juan Caicedo, MD, Northwestern University, Associate Professor of Surgery, Chicago, IL, USA

3:15 pm **Research**
Tanjala Purnell, PhD, MPH, Johns Hopkins School of Medicine, Baltimore, MD, USA

3:30 pm **Education and Workforce**
Benjamin Samstein, MD, Weill Cornell Medical Center, Chief of Liver Transplantation, New York, NY, USA

3:45 pm **Activism/Community Engagement**
Remonia Chapman, Detroit MOTTEP, Detroit, MI, USA

4:00 pm **Live Video Question and Answer**

In-Depth
Prof Develop
3:00 pm - 5:30 pm

Mastering the Transplant Essentials
Moderators: Georgeine Smith, MS, PA-C, MHS, Hospital of the University of Pennsylvania, Philadelphia, PA, USA, Jennifer Sharp, MS, University of Michigan, Ann Arbor, MI, USA

3:00 pm **Basic Immunology Overview**
Leonardo Riella, MD, PhD, Massachusetts General Hospital, Medical Director of Kidney Transplantation, Boston, MA, USA

3:10 pm **Pharmacology Basics for Transplantation**
Christin Rogers Marks, PharmD BCPS FAST FCCP, Massachusetts General Hospital Transplant Center, Norton, MA, USA

3:20 pm **Anxiety, Depression, and Non-compliance in Transplant**
Mary Amanda Dew, PhD, University of Pittsburgh School of Medicine and Medical Center, Professor of Psychiatry, Psychology, Epidemiology, Nursing, Biostatistics, and Clinical and Translational Science, Pittsburgh, PA, USA

3:30 pm **Transplant Drug Abuse and Caregiver Concerns**
Regina Miller, BA, BSN, MSS,LCSW, Penn Medicine-HUP, Social Work Transplant Manager, Philadelphia, PA, USA

3:40 pm **Live Video Question and Answer**

4:00 pm **Break**

4:30 pm **Abdominal Complications**
Katherine Klingenberg, PA-C, University of Colorado, Director of Transplant Advanced Practice, Evergreen, CO, USA

4:40 pm **Early Infections in Transplant Patients - Case Studies**
Mark Burns, DNP, FNP, Mayo Clinic, NP, Gilbert, AZ, USA

4:50 pm **Live Video Question and Answer**

In-Depth
Basic: Translational
3:00 pm - 5:30 pm

New Approaches to Tackling Alloimmunity
Moderators: Reza Abdi, MD, Brigham & Womens Hosp, Boston, MA, USA, Ginny Bumgardner, MD PhD FACS, Ohio State University, Professor of Surgery, Columbus, OH, USA

3:00 pm **Cellular Therapy to Modify the Recipient Immune System**
Suzanne Ildstad, MD, University of Louisville / Talaris Therapeutics, Inc, Founder and CSO, Louisville, KY, USA

3:15 pm **Delivery of Targeted Immunosuppression**
Evan Scott, PhD, Northwestern University, Kay Davis Professor of Biomedical Engineering, Evanston, IL, USA

3:30 pm **Live Video Question and Answer**

4:00 pm **Break**

Moderators: Sunil Kurian, PhD, Scripps Health, Research Scientist, La Jolla, CA, USA

4:30 pm **Modifying the Immune Trafficking**
Jonathan Bromberg, MD, PhD, University of Maryland School of Medicine, Professor of Surgery and Microbiology and Immunology, Baltimore, MD, USA

4:45 pm **Single Cell Analysis for Diagnostics?**
Andrew Malone, MD, Washington University School of Medicine, Saint Louis, MO, USA

5:00 pm **Update on Tolerance Induction Protocols**
Megan Sykes, MD, Columbia University, Professor, Columbia University, Director, Columbia Center for Translational Immunology, Columbia University, New York, NY, USA

5:15 pm **Live Video Question and Answer**

5:30 pm **Break**

Networking Event

Prof Develop: Women's Health
6:00 pm - 8:00 pm

ATC's Women's Networking Event

6:00 pm **Strategies to Enhance Health & Wellness**
Elizabeth Pomfret, MD PhD, University of Colorado, Chief of Transplant Surgery, Aurora, CO, USA

Christina Klein, MD, Piedmont Transplant Institute, Medical Director, Kidney and Pancreas Transplant, Atlanta, GA, USA

6:00 pm **Tips for Managing Your Time**
Debra Sudan, MD, Duke University Medical Center, Prifessor if Surgery, Durham, NC, USA

Kathryn Tinckam, MD, MBA, MMSc,FRCPC, FAST, University Health Network, Physician-in-Chief, Toronto, ON, Canada

6:00 pm **Optimizing Mentor/Mentee Interactions**
Wendy Grant, MD, University of Nebraska Medical Center, College of Medicine, Professor of Surgery, Associate Dean for Admissions and Student Affairs, Omaha, NE, USA

Deirdre Sawinski, MD, University of Pennsylvania, Associate Professor of Medicine, Philadelphia, PA, USA

6:00 pm **Productive Communication**
Julie Heimbach, MD, Mayo Clinic, Chair, Division of Transplanation Surgery, Rochester, MN, USA

Maryjane Farr, MD, NewYork-Presbyterian/Columbia University Medical Center, Associate Professor, Medical Director, Adult Heart Transplant, New York, NY, USA

6:00 pm **Tips to Launching a Research Program**
Linda Cendales, MD, Duke University Medical Center, Durham, NC, USA

Lisa Van Wagner, IL, USA

6:00 pm **Enhancing Your Letters of Recommendation**
Ginny Bumgardner, MD PhD, Ohio State University, Professor of Surgery, Columbus, OH, USA

Deborah Adey, MD, UCSF, Professor of Medicine, Orinda, CA, USA

6:00 pm **Building Professional Connections**
Irene Kim, MD, Cedars-Sinai Medical Center, Los Angeles, Co-Director, Comprehensive Transplant Center, Associate Professor of Surgery, Los Angeles, CA, USA

Lori West, MD, D.Phil, University of Alberta, Professor, Edmonton, AB, Canada

AMERICAN TRANSPLANT CONGRESS

Day-at-a-Glance, Saturday, June 5, 2021

All Live Broadcast Programs are in Eastern Time

8:45 am – 9:00 am	**Welcome**
9:00 am – 10:00 am	**IMPACT Sessions**
10:00 am – 10:30 am	**Break**
10:30 am – 11:30 am	**Plenary Oral Abstract Session 1**
11:30 am – 12:00 pm	**Sponsor Networking**
12:00 pm – 12:30 pm	**ASTS Presidential Address**
12:30 pm – 1:30 pm	**ASTS Research Grants & Pioneer Award**
1:30 pm – 2:30 pm	**Satellite Symposia**
2:30 pm – 3:00 pm	**Break**
3:00 pm – 4:00 pm	**IMPACT Sessions**
4:00 pm – 4:30 pm	**Sponsor Networking**
4:30 pm – 5:30 pm	**Rapid Fire Oral Abstract**
4:30 pm – 7:00 pm	**Focus in Transplantation**
5:30 pm – 6:00 pm	**Break**
6:00 pm – 7:00 pm	**Rapid Fire Oral Abstract**
7:00 pm – 7:30 pm	**Break**
7:00 pm – 7:30 pm	**Sponsor Networking**
7:30 pm – 8:30 pm	**Poster Video Chat**
8:30 pm – 8:45 pm	**Break**
8:45 pm – 9:30 pm	**Expert VIP Meet Up**

Welcome
8:45 am – 9:00 am

IMPACT Sessions
Kidney
9:00 am - 10:00 am

How Low Can You Go? Assessing GFR in Living Kidney Donor Candidates
Moderators: Martha Pavlakis, MD, FAST, FASN, Beth Israel Deaconess Medical Center, Medical Director, Kidney and Pancreas Transplantaion, Boston, MA, USA, Edmund Huang, M.D., Cedars-Sinai Medical Center, Associate Professor of Medicine, Los Angeles, CA, USA

9:00 am **Association of Pre-Donation GFR on Post-Donation Outcomes - Defining the Appropriate GFR Threshold for Kidney Donation**
Emilio Poggio, MD, Cleveland Clinic, Medical Director, Kidney Transplant Program, Cleveland, OH, USA

9:20 am **Principles of GFR Measurement and Estimation - How to Evaluate GFR in Living Kidney Donor Candidates**
Nicolae Leca, MD, University of Washington, Medical Director Kidney and Pancreas Transplant Program, Seattle, WA, USA

9:10 am **Impact of Estimation Versus Measurement of GFR on the Eligibility of Potential Living Kidney Donors**
Francois Gaillard, M.D. PhD, Assistance Publique Hopitaux de Paris, Nephrology Fellow, Paris, France

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Kidney
9:00 am - 10:00 am

To Band or not to Band? AVF Access Ligation after Kidney Transplantation
Moderators: Chris Freise, MD, Univ of California-San Francisco, Interim CHief of Abdominal Transplant, San Francisco, CA, USA, Sagar Nigwekar, MD, MMSc, Massachusetts General Hospital, Dr, Boston, MA, USA

9:00 am **AVF Banding in Post-transplantation: Nephrologist's Point of View**
Claudio Rigatto, MD, University of Manitoba, AVF Banding in Post-transplantation: Nephrologist's Point of View, Winnipeg, MB, Canada

9:10 am **AVF Banding in Post-transplantation: Cardiologist's Point of View**
Ronald Zolty, University of Nebraska Medical Center, UNMC, Omaha, NE, USA

9:20 am **Live Video Question and Answer**

IMPACT Sessions
Liver
9:00 am - 10:00 am

Technical Versus Oncologic Approaches to Resectability
Moderators: M B Majella Doyle, Saint Louis, MO, USA, Charles Rosen, MD, Mayo Clinic, Professor of Surgery, Rochester, MN, USA

9:00 am **Colorectal Metastases to Deliver: Resection vs. Transplantation**
Roberto Hernandez-Alejandro, MD, University of Rochester Medical Center, Professor of Surgery, Rochester, NY, USA

9:10 am **Liver Transplantation for HCC: Resection vs. Liver Transplantation**
Timothy Pawlik, MD, MPH, PhD, The Ohio State University Wexner Medical Center, Professor and Chair of Surgery, Columbus, OH, USA

9:20 am **Criteria for Ex vivo Resection for Unresectable Tumors**
Tomoaki Kato, MD, MBA, Columbia University - College of Physicians & Surgeons, Professor of Surgery, New York, NY, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Heart
9:00 am - 10:00 am

DCD Donors for Heart Transplantation - The Devil is in the Details

Moderators: Lavanya Bellumkonda, MD, Yale School of Medicine, Associate Professor, New Haven, CT, USA, Francis Pagani, MD PhD, University of Michigan, Otto Gago MD Professor of Cardiac Surgery, Ann Arbor, MI, USA

9:00 am **Ethics and Legal Consideration in Accepting DCD Donors for Heart Transplantation**
Alexandra Glazier, JD, MPH, New England Donor Services, Inc., Waltham, MA, USA

9:10 am **The DCD Heart Trial: Study Design and Inclusion Criteria**
Jason Smith, MD, University of Wisconsin, Surgical Director of Heart Transplant and Mechanical Support, Madison, WI, USA

9:20 am **DCD Hearts Are Well Supported By Normothermic Regional Perfusion But There Are Transplant and OPO Challenges in Program Initiation**
Nader Moazami, MD, NYU Langone Transplant Institute, Professor of Cardiothoracic Surgery, New York, NY, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pediatric
9:00 am - 10:00 am

When is a Combined Organ Transplant an Appropriate use of Organs in the Pediatric Recipient?

Moderators: Amy Gallo, Stanford, Palo Alto, CA, USA, Dominique Jan, MD, Montefiore-Albert Einstein College of Medicine, Professor of Surgery, Bronx, NY, USA

9:00 am **Updates on Heart/Liver Transplantation**
C. Andrew Bonham, MD, Stanford University Medical Center, Associate Professor, Palo Alto, CA, USA

9:10 am **Post Fontan Heart Liver Transplantation - How to Evaluate and Manage**
Lee Goldberg, MD, MPH, University of Pennsylvania, Professor of Medicine, Section Chief Advanced Heart Failure and Cardiac Transplant, Philadelphia, PA, USA

9:20 am **The Case for Combined Liver-Intestine or Multi-Visceral Transplants?**
Kishore Iyer, MBBS, FRCS, FACS,, Mount Sinai Hospital, Professor of Surgery & Pediatrics, New York, NY, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Basic: Basic
9:00 am - 10:00 am

Extracellular Vesicles in Transplantation

Moderators: Angus Thomson, PhD,DSc, University of Pittsburgh, Gilles Benichou, MD PhD, Mass Gen Hosp Harvard Med Sch, Associate Professor of surgery and immunology, Boston, MA, USA

9:00 am **Exosomes in B Cell Sensitization**
Adrian Morelli, MD, PhD, Univ of Pittsburgh, Professor, Pittsburgh, PA, USA

9:10 am **Exosomes as a Biomarker for Tissue Rejection**
Prashanth Vallabhajosyula, MD, MS, Yale University School of Medicine, Associate Professor of Surgery, New Haven, CT, USA

9:20 am **IL-35: Exokine, How Transplant Tolerance Gets Local**
William Burlingham, PhD, University of Wisconsin, Professor-Emeritus, Madison, WI, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Translational
9:00 am - 10:00 am

The Infection Rejection Connection in Solid Organ Transplantation

Moderators: Deepali Kumar, MD, University Health Network, Toronto, ON, Canada, Hans H. Hirsch, MD, MSc, University of Basel / Department Biomedicne, Professor, Basel, Switzerland

9:00 am **T cell Mediated Protection to CMV**
Jonathan Maltzman, MD, PhD, FAST, Stanford University, Associate Professor, Palo Alto, CA, USA

9:10 am **Infection and Lung Transplantation**
Daniel Calabrese, MD, University of California, San Francisco, Assistant Professor, San Francisco, CA, USA

9:20 am **BK and Rejection**
Michelle Josephson, MD, University of Chicago, Medical Director, Kidney and Pancreas Transplantation, Chicago, IL, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

ID
9:00 am - 10:00 am

The Infected Donor and Recipient: When is it Safe to Transplant

Moderators: Jennifer Chow, MD, MS, Tufts Medical Center, Associate Professor Of Medicine, Boston, MA, USA, Michael Ison, MD, MS, Northwestern University Comprehensive Transplant Center, Professor, Chicago, IL, USA

9:00 am **Endemic Mycosis**
Rachel Miller, MD, Duke University, Professor of Medicine, DURHAM, NC, USA

9:15 am **Multi-drug Resistant Organisms**
Fernanda Silveira, MD, University of Pittsburgh and UPMC, Associate Professor of Medicine, Pittsburgh, PA, USA

9:30 am **Chagas Seropositive Donor for Heart Transplant Candidate**
Ricardo La Hoz, MD, University of Texas Southwestern Medical Center, Associate Professor of Internal Medicine, Dallas, TX, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pharmacy
9:00 am - 10:00 am

Stop the Pain! Novel Opioid Minimization Strategies to Mitigate Pain in the Pre-, Peri-, and Post-Operative Transplant Phases

Moderators: Erika Meredith, PharmD, BS, Emory Healthcare, Clinical Pharmacy Specialist, Solid Organ Transplant, Atlanta, GA, USA, Nicole Pilch, PharmD, MS, BCPS, Medical University of South Carolina, Quality and Safety Operations Director, Associate Professor of Clinical Pharmacy, Charleston, SC, USA

9:00 am **Role of ERAS Protocols and Blocks for the Elimination of Opioids in the Post-operative Transplant Phase**
Jeanette Avery, DNP, AGACNP-BC, VCU Health, Richmond, VA, USA

9:10 am **Non-opioid Pharmacologic Alternatives for Pain Control Pearls/Pitfalls**
Maya Campara, PharmD, UIC, Clinical Associate Professor/Transplant Clinical Pharmacist, Chicago, IL, USA

9:20 am **Peri-operative Strategies to Mitigate Opioid Utilization Post Kidney Transplant**
Vinayak Rohan, MD, Medical University of South Carolina, Assistant Professor, Charleston, SC, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Public Policy
9:00 am - 10:00 am

US Organ Allocation - An Update

Moderators: Nicole Turgeon, MD, Dell Seton Medical Center at The University of Texas, Professor of Surgery, Austin, TX, USA, Sean Pinney, MD, University of Chicago, Chicago, IL, USA

9:00 am **The Times, They Are a Changing - Lungs**
Maryam Valapour, MD, MPP, Cleveland, OH, USA

9:10 am **The Times, They Are a Changing - Liver**
James Trotter, MD, Baylor Dallas, doctor, Dallas, TX, USA

9:20 am **The Times They Are a Changing - Heart**
Shelley Hall, MD, Baylor Univ Medical Center, Chief, Transplant Cardiology, MCS and Adv HF, Dallas, TX, USA

9:30 am **The Times, They Are a Changing - Kidney**
Vincent Casingal, MD, Atrium Health-Carolinas Medical Center, Chief, Division of Abdominal Transplant, Charlotte, NC, USA

9:40 am **Live Video Question and Answer**

IMPACT Sessions

Ethics
9:00 am - 10:00 am

We Said Yes; Transplanting Patients with Alcoholic Liver Disease: Time to Focus on Aftercare

Moderators: Sheila Jowsey-Gregoire, MD, Mayo Clinic, Associate Professor of Psychiatyr, Rochester, MN, USA, Jared White, MD, Medical University of South Carolina Transplant Center, Associate Professor of Surgery, Charleston, SC, USA

9:00 am **The Risk and Protective Factors Preventing Relapse (The Six-month Rule is so Yesterday.)**
Jody Jones, PhD, University of Iowa Hospitals and Clinics, Clinical Associate Professor, Department of Surgery, Iowa City, IA, USA

9:10 am **When the Carrot is Gone: Utilizing an Integrative Group Therapy Approach with Alcohol Liver Transplant Recipients to Reduce Relapse after Transplant**
Wendy Balliet, Ph.D., Medical University of South Carolina, Associate Professor; Clinical Psychologist, Charleston, SC, USA

9:20 am **Live Video Question and Answer**

10:00 am **Break**

Plenary Session 1

10:30 am - 11:30 am

Moderators: Marwan Abouljoud, MD, CPE, FACS, MMM, Henry Ford Transplant, Detroit, MI, USA, Richard Formica, MD, FAST, Yale Univ School of Medicine, New Haven, CT, USA

10:30 am **Donor Derived Transmissions 2019: Analysis of the OPTN Ad Hoc Disease Transmission Advisory Committee (DTAC)**
L. Danziger-Isakov[1], M. G. Michaels[1], A. Agarwal[1], S. Aslam[1], K. Dunn[1], J. Goldman[1], D. Levine[1], C. Marboe[1], G. Marklin[1], S. Pouch[1], M. Rana[1], R. Razonable[1], H. L. Stevenson[1], H. S. Te[1], A. Woolley[1], E. Ward[2], C. Jett[2], L. Cartwright[2], R. La Hoz[1], [1]OPTN DTAC, Richmond, VA, USA, [2]UNOS, Richmond, VA, USA

10:40 am **Combined CD11b/CD40 Blockade is Superior to CD40 Blockade Alone in Prolonging Survival in Pig-to-Nonhuman Primate Renal Xenotransplantation**
D. A. Faber[1], B. Lovasik[1], A. Matar[1], C. Breeden[1], S. Kim[1], A. Adams[2], [1]Surgery, Emory University School of Medicine, Atlanta, GA, USA, [2]Surgery, University of Minnesota, Minneapolis, MN, USA

10:50 am **Engineered Human Glomerular Endothelial Cells to Identify Non-hla Antibodies and Decipher Their Pathogenicity After Kidney Transplantation**
B. Lamarthée[1], C. Burger[1], C. Leclaire[1], L. Morin[1], F. Terzi[1], C. Tinel[1], D. Anglicheau[2], [1]Inserm U1151, Necker-Enfants Malades Institute, Paris, France, [2]Necker Hospital, AP-HP, Department of Nephrology and Kidney Transplantation, Paris, France

11:00 am **Myeloid Foxo1-β-catenin Axis Regulates Hedgehog/Gli1 Signaling and Controls NLRP3-Mediated Innate Immune Responses in Sterile Inflammatory Liver Injury**
D. Xu, C. Li, M. Sheng, Y. Lin, Y. Tian, Y. Zhan, A. J. Coito, R. W. Busuttil, D. G. Farmer, J. W. Kupiec-Weglinski, B. Ke, Surgery, Dumont - UCLA Transplant Center, Los Angeles, CA, USA

11:10 am **Live Video Question and Answer**

Sponsor Networking

11:30 am - 12:00 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Sanofi - Going the Distance: The Changing Map of Kidney Allocation - Hosted by Dr John Friedewald

Veloxis - Real World Application of ENVARSUS XR® (PART 1) – De Novo Dosing and Monitoring

ASTS Presidential Address

All Topics
12:00 pm - 12:30 pm

ASTS Presidential Address

12:00 pm **Introduction**
Lloyd Ratner, MD, MPH, Columbia University, New York, NY, USA

12:10 pm **Presidential Address**
Marwan Abouljoud, MD, CPE, FACS, MMM, Henry Ford Transplant Institute, Detroit, MI, USA

Society Awards

All Topics
12:30 pm - 1:30 pm

ASTS Research Grants & Pioneer Award

12:30 pm **Research Grants Presentations**
John Roberts, MD, University of California San Francisco, San Francisco, CA, USA

1:00 pm **Research Grants & Pioneer Award Presentation**
Marwan Abouljoud, MD, CPE, FACS, MMM, Henry Ford Transplant Institute, Detroit, MI, USA

Sponsored Satellite Symposia

1:30 pm - 2:30 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

dd-cfDNA and GEP in Kidney Transplantation – Redundant or Complementary?

Supported by Eurofins Transplant Diagnostics

Fresh Perspectives on Rejection Assessment with cfDNA

Supported by Natera

IMPACT

Rapid Fire Oral Abstracts

Liver
4:30 pm - 5:30 pm

Living Donor Liver Transplant and Partial Grafts

Moderators: Roberto Hernandez-Alejandro, MD, University of Rochester Medical Center, Professor of Surgery, Rochester, NY, USA, Tarunjeet Klair, M.D., University of Texas Health San Antonio, Assistant Professor of Surgery, Director Living Donor Liver Transplantation, San Antonio, TX, USA

4:30 pm **Paired Exchanges in LDLT- A Good Option for Patients with Incompatible Donors**
A. Humar, C. Hughes, G. Mazariegos, S. Kyle, A. Gallatin, K. Emmett, A. Tevar, M. Molinari, A. Ganoza, V. Gunabushanam, S. Ganesh, *University of Pittsburgh, Pittsburgh, PA*

4:35 pm **Impact of Advanced Renal Dysfunction on Post-Transplant Outcomes After Living Donor Liver Transplantation in the United States**
T. Bittermann[1], N. Kaur[2], P. L. Abt[1], K. M. Olthoff[1], J. K. Heimbach[3], J. Emamaullee[2], *[1]University of Pennsylvania, Philadelphia, PA, [2]University of Southern California, Los Angeles, CA, [3]Mayo Clinic College of Medicine, Rochester, MN*

4:40 pm **Impact of Community- Targeted Educational Campaign on Living Donor Transplants**
S. Ganesh, A. Humar, *Transplant, UPMC, Pittsburgh, PA*

4:45 pm **Trends in Liver Donors for Liver Transplantation Over Twenty Years: Donor Changes in Gender, Relationships, and Education, but Racial Disparities Remain**
A. Kaplan, B. Fortune, R. Brown, MD, MPH, B. Samstein, K. Halazun, R. Rosenblatt, *Gastroenterology and Hepatology, New York Presbyterian/Weill Cornell, New York, NY*

4:50 pm **The Impact of Splenectomy on Living Donor Liver Transplantation Using Small Grafts**
M. Fujiki, E. Aleassa, C. Quintini, F. Aucejo, K. Sasaki, B. Eghtesad, T. Diago, D. Kwon, C. Miller, K. Hashimoto, *Cleveland Clinic Foundation, Cleveland, OH*

4:55 pm **Re-Do Hepatic Artery Reconstruction for Thrombosis Can Save Grafts and Patients without Retransplantation: Lessons Learned from 1,355 Adult Living Donor Liver Transplantations**
S. Hong, N. Yi, K. Hong, E. Han, S. Suh, J. Lee, S. Hong, Y. Choi, U. Jin, H. Chang, K. Lee, K. Suh, *Seoul National University Hospital, Seoul, Korea, Republic of*

5:00 pm **Death Among Living Liver Donors- Are We Overestimating the Risk?**
H. J. Braun, A. M. Shui, N. L. Ascher, J. P. Roberts, *University of California, San Francisco, San Francisco, CA*

5:05 pm **Liver Live Donor Champion: Advocacy Training to Facilitate Identification of Living Liver Donors**
L. R. Herbst, Y. Yu, A. Love, K. Lee, A. Wells, K. Mohr, A. Massie, A. Gurakar, B. King, D. L. Segev, A. M. Cameron, J. Garonzik Wang, *Johns Hopkins University, Baltimore, MD*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

VCA
4:30 pm - 5:30 pm

VCA: Basic and Clinical

Moderators: Rolf Barth, MD, University of Chicago, Professor of Surgery, Chicago, IL, USA, Amer Hatem

4:30 pm **Twelve Live Births After Uterus Transplantation in the Dallas Uterus Transplant Study**
L. Johannesson, G. J. McKenna, A. Wall, J. Bayer, G. Testa, *Baylor University Medical Center, Dallas, TX*

4:35 pm **Immunosuppression in Uterine Transplant Recipients: Experience from the Largest Uterine Transplant Program**
N. Wilson, R. Patel, L. Johannesson, G. Testa, T. Sam, *Baylor University Medical Center at Dallas, Dallas, TX*

4:40 pm **A Multi-institutional Study of Renal Outcomes in Uterus Transplantation**
D. Sawinski[1], L. Johannesson[2], J. Kristen[3], J. Fronek[3], P. Porrett[4], *[1]Hospital of the University of Pennsylvania, Philadelphia, PA, [2]Department of Surgery, Baylor University Medical Center, Dallas, TX, [3]Institute for Clinical and Experimental Medicine, Prague, Czech Republic, [4]University of Alabama at Birmingham, Birmingham, AL*

4:45 pm **Stem Cell and Novel Neurotrophic Factors to Promote Functional Outcomes in Limb Transplantation**
S. K. Salgar[1], J. Weiss[2], C. Phillips[2], E. Malin[2], V. Gorantla[3], J. Harding[4], *[1]Clinical Investigation, United States Army, Tacoma, WA, [2]Clinical Investigation, Madigan Army Medical Center, Tacoma, WA, [3]Surgery, Wake Forest University, Winston-Salem, NC, [4]Neuroscience, Washington State Universisty, Pullman, WA*

4:50 pm **Recovery After Extended Static Cold Storage Preservation Using Subnormothermic Machine Perfusion in VCA**
M. Goutard[1], R. J. de Vries[1], A. G. Lellouch[1], E. Lupon[1], C. Pendexter[1], S. N. Tessier[1], M. A. Randolph[1], L. Lantieri[2], C. L. Cetrulo[1], K. Uygun[1], *[1]Massachusetts General Hospital, Harvard Medical School, Shriners Hospitals for Children, Boston, MA, [2]Hôpital Européen Georges Pompidou, Paris, France*

4:55 pm **A Noninvasive Diagnostic Approach for Molecular Monitoring of Face Transplant Recipients**
C. Snopkowski[1], P. Rabbani[2], H. Yang[1], Z. Berman[2], G. Diep[2], C. Li[1], T. Muthukumar[1], R. Ding[1], D. Ceradini[2], M. Suthanthiran[1], *[1]Weill Cornell Medical Institute, Department of Medicine, Division of Nephrology, NY, NY, [2]NYU Langone Health, Hansjörg Wyss Department of Plastic Surgery, NY, NY*

5:00 pm **Live Video Question and Answer**

Focus in Transplantation

Basic
4:30 pm - 7:00 pm

Basic: New Roles of Secondary Immune Organs in Rejection

Moderators: Reza Abdi, MD, Brigham & Womens Hosp, Professor of Medicine, Boston, MA, USA, Daniel Streblow, PhD, Oregon Health and Science University, Professor, Beaverton, OR, USA

4:30 pm **Lymphatic Vessels Regulate Immune Microenvironments in Cancer and Infectious Immunity**
Amanda Lund, PhD, NYU Grossman School of Medicine, Associate Professor, New York, NY, USA

4:45 pm **Sphingosine 1-Phosphate Receptors and Afferent Lymphatic Migration**
Jonathan Bromberg, MD, PhD, University of Maryland School of Medicine, Professor of Surgery and Microbiology and Immunology, Baltimore, MD, USA

5:00 pm **Live Video Question and Answer**

5:30 pm **Break**

6:00 pm **DC Subset and Localization in the LN determines Tfh Priming**
Stephanie Eisenbarth, MD PhD, Yale, Associate Professor, New haven, CT, USA

6:15 pm **The Role of BALT in Lung Transplant Rejection and Tolerance**
Daniel Kreisel, MD, PhD, Washington University St Louis, Professor of Surgery, Pathology and Immunology, St. Louis, MO, USA

6:30 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

ID: COVID-19
6:00 pm - 7:00 pm

COVID-19 in Kidney Recipients

Moderators: Deeksha Jandhyala, M.D., Medical University of South Carolina, M.D., Assistant Professor of Medicine, Transplant Infectious Diseases, Charleston, SC, USA, Paschalis Vergidis, MD, MSc, Mayo Clinic, Assistant Professor, Rochester, MN, USA

6:00 pm **COVID-19 in the Kidney Transplant Waitlist Population**
A. C. Johnson[1], C. P. Larsen[1], H. Gebel[2], R. Bray[2], *[1]Surgery, Emory University, Atlanta, GA, [2]Pathology, Emory University, Atlanta, GA*

6:05 pm **Predictors of Severe Covid-19 in Kidney Transplant Recipients in the First and Second Waves: Analysis of the Spanish Registry**
M. Crespo[1], A. Mazuecos[2], I. Pérez-Flores[3], F. Moreso[4], A. Andrés[5], C. Jimenez[6], M. Molina[7], C. Canal[8], L. Sánchez-Cámara[9], S. Zárraga[10], M. Ruiz Fuentes[11], M. Aladrén[12], E. Melilli[13], V. López[14], E. Sanchez[15], J. Pascual for Spanish Nephro Society Covid-Registry[1], *[1]Nephrology, Hospital del Mar, Barcelona, Spain, [2]Nephrology, Hospital Puerta del Mar, Cadiz, Spain, [3]Nephrology, Hospital Clinico San Carlos, Madrid, Spain, [4]Nephrology, Hospital Valle Hebrón, Barcelona, Spain, [5]Nephrology, Hospital 12 Octubre, Madrid, Spain, [6]Nephrology, Hospital La Paz, Madrid, Spain, [7]Nephrology, Hospital Germans Trias i Pujol, Barcelona, Spain, [8]Nephrology, Fundacio Puigvert, Barcelona, Spain, [9]Nephrology, Hospital Gregorio Marañón, Madrid, Spain, [10]Nephrology, Hospital de Cruces, Bilbao, Spain, [11]Nephrology, Hospital Virgen de las Nieves, Granada, Spain, [12]Nephrology, Hospital Miguel Servet, Zaragoza, Spain, [13]Nephrology and Kidney Transplantation, Hospital de Bellvitge, Barcelona, Spain, [14]Nephrology, Hospital Regional de Málaga, Malaga, Spain, [15]Nephrology, Hospital de Cabueñes, Gijon, Spain*

6:10 pm **SARS-CoV-2 Antibody Response After Induction Therapy in Kidney Transplant Recipients**
M. Lubetzky[1], S. Sultan[2], Z. Zhao[3], M. Cushing[3], Z. Kapur[1], S. Albakry[1], N. Hauser[1], J. Marku-Podvorica[1], R. Craig-Schapiro[2], J. Lee[1], T. Salinas[1], M. Aull[2], S. Kapur[2], M. Suthanthiran[1], D. Dadhania[1], *[1]Nephrology, Weill Cornell-NYPresbyterian, New York, NY, [2]Transplant Surgery, Weill Cornell-NYPresbyterian, New York, NY, [3]Pathology, Weill Cornell-NYPresbyterian, New York, NY*

6:15 pm **Characterizing Kidney Transplant Recipients with SARS-CoV-2: An Academic Single Center Experience**
S. Nahi, A. Shetty, S. Tanna, J. Leventhal, *Northwestern University, Chicago, IL*

6:20 pm **Prevalence and Dynamics of SARS-COV-2 IgG in Kidney Transplant Recipients**
Y. Al Azzi, P. Loarte, C. Pynadath, O. Alani, L. Liriano-Ward, M. Ajaimy, R. Bartash, J. Graham, M. Le, H. Yaffe, S. Greenstein, J. Rocca, M. Kinkhabwala, E. Akalin, *Montefiore Medical Center, New York, NY*

6:25 pm **The Impact of Covid-19 in Kidney Transplant Recipients: A Systematic Review and Meta-analysis**
J. Kumar[1], J. Pyda[2], I. Reccia[3], F. VIrdis[4], P. Bachul[1], R. Barth[1], Y. Becker[1], J. Fung[1], P. Witkowski[1], *[1]University of Chicago, Chicago, IL, [2]Beth Israel, Boston, MA, [3]Imperial College, London, United Kingdom, [4]Royal London, London, United Kingdom*

6:30 pm **Profile of SARS-CoV-2 Antibodies in Patients Awaiting Kidney Transplantation**
L. Muir[1], A. Jaffer[2], C. Rees-Spear[1], V. Gopalan[2], F. Chang[2], G. Vaitkute[1], R. Fernando[3], C. Roustan[4], A. Rosa[4], C. Earl[4], A. Salama[2], P. Cherepanov[4], L. E. McCoy[1], R. Motallebzadeh[2], *[1]Institute of Immunity & Transplantation, University College London, London, United Kingdom, [2]Nephrology & Transplantation, Royal Free London Hospital NHS Trust, London, United Kingdom, [3]Anthony Nolan Institute, Royal Free London Hospital NHS Trust, London, United Kingdom, [4]The Francis Crick Institute, London, United Kingdom*

6:35 pm **Modification in Immunosuppression Regimens to Safely Perform Kidney Transplants Amid the Covid-19 Pandemic**
L. Von Stein, O. Witkowsky, L. Samidurai, K. Flores, M. Doraiswamy, T. Pesavento, P. Singh, *The Ohio State University Wexner Medical Center, Columbus, OH*

6:40 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Lung
6:00 pm - 7:00 pm

How to Expect the Unexpected-Incorporating Predictors into Lung Transplant Decision Making

Moderators: Hannah Mannem, MD, University of Virginia, Assistant Professor of Medicine, Charlottesville, VA, USA, Wayne Tsuang, MD MHS, Cleveland Clinic, Assistant Professor Medicine, Cleveland Clinic Lerner College of Medicine, Cleveland, OH, USA

6:00 pm **A Molecular Classifier Identifies Antibody-Mediated Rejection-Associated Changes in Lung Transplant Biopsies**
K. S. Madill-Thomsen[1], K. M. Halloran[2], M. Parkes[1], P. F. Halloran[1], &. the INTERLUNG Study Group[3], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]University of Alberta, Edmonton, AB, Canada, [3]AB, Canada*

6:05 pm **Molecular Classifiers for Chronic Lung Allograft Dysfunction Transbronchial and Mucosal Biopsies Predict Clinical CLAD and Graft Loss**
M. D. Parkes[1], P. F. Halloran[2], K. M. Halloran[3], &. the INTERLUNG Study Group[4], *[1]Alberta Transplant Applied Genomics Centre, Edmonton AB, AB, Canada, [2]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [3]University of Alberta, Edmonton AB, AB, Canada, [4]AB, Canada*

6:10 pm **Assessing the Accuracy of the Lung Allocation Score**
N. Dussault[1], W. Parker[1], R. Jablonski[1], E. Garrity[1], M. Churpek[2], *[1]University of Chicago, Chicago, IL, [2]University of Wisconsin-Madison, Madison, WI*

6:15 pm **Liver Kinase B1 Knockdown Induces Platelet-Derived Growth Factor Receptor B Expression in Human Airway Epithelial Cells: A Potential Mechanism for Development of Fibrosis Leading to Chronic Lung Allograft Dysfunction**
M. Rahman, J. Lee, R. Ravichandran, T. Fleming, M. Smith, R. Bremner, T. Mohanakumar, *St. Joseph's Hospital and Medical Center, Phoenix, AZ*

6:20 pm **Allograft Discard Risk Index for Lung Transplantation**
R. M. Reul, G. Loor, P. S. Garcha, A. A. Rana, *Baylor College of Medicine, Houston, TX*

6:25 pm **Perioperative Blood Transfusion is Associated with the Development of New HLA Antibodies After Adult Lung Transplantation**
A. Hicks[1], A. Stoker[2], M. Cooter[2], A. Ali[3], J. Klapper[4], J. Poisson[5], D. Chen[5], J. Haney[4], K. Ghadimi[2], M. Hartwig[4], I. Welsby[2], B. Bottiger[2], *[1]Anesthesiology, Duke University Hospital, South Portland, ME, [2]Anesthesiology, Duke University Hospital, Durham, NC, [3]Pulmonology, Allergy and Critical Care Medicine, Duke University Hospital, Durham, NC, [4]Cardiothoracic Surgery, Duke University Hospital, Durham, NC, [5]Pathology, Duke University Hospital, Durham, NC*

6:30 pm **A Randomized, Multicenter, Blinded Study Assessing the Effects of Gaseous Nitric Oxide in an Ex Vivo System of Human Lungs**
M. G. Hartwig[1], J. A. Klapper[1], N. Poola[2], A. Banga[3], P. G. Sanchez[4], J. S. Murala[3], J. L. Potenziano[2], *[1]Duke University Medical Center, Durham, NC, [2]Mallinckrodt Pharmaceuticals, Bedminster, NJ, [3]University of Texas Southwestern Medical Center, Dallas, TX, [4]University of Pittsburgh Medical Center, Pittsburgh, PA*

6:35 pm **Outcomes of Cytomegalovirus Status Determining Induction Therapy in Lung Transplant**
K. Heagler[1], J. Lyons[1], B. Bemiss[2], P. Stracener[1], *[1]Pharmacy, Loyola University Medical Center, Maywood, IL, [2]Loyola University Medical Center, Maywood, IL*

6:40 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Kidney
6:00 pm - 7:00 pm

Kidney: Cardiovascular and Metabolic Complications

Moderators: Anita Mehrotra, MD, Lourdes Medical Associates Transplant Nephrology, Dr., Camden, NJ, USA, Mita Shah, MD, University of California San Diego, Medical Director, San Diego, CA, USA

6:00 pm **Cognition After Belatacept Conversion (CAB) Trial**
W. Asch[1], K. Belfield[2], V. Do[2], E. Cohen[1], *[1]Yale University, New Haven, CT, [2]Yale New Haven Hospital, New Haven, CT*

6:05 pm **The Impact of 4-weeks of Supervised Exercise on Frailty and Lower Extremity (LE) Function in Patients with Advanced Chronic Kidney Disease (CKD)**
E. Lorenz, L. Hickson, R. Weatherly, K. Thompson, M. Hogan, C. Kennedy, *Mayo Clinic, Rochester, MN*

6:10 pm **Growth Differentiation Factor 15 Predictor Value is Superior to Troponin I in the Evaluation of Kidney Transplant Candidates**
M. de Cos Gomez[1], M. Garcia Unzueta[2], A. Benito Hernandez[1], J. Mazon Ruiz[1], M. Perez Arnedo[1], A. Aguilera Fernandez[1], R. Valero San Cecilio[1], J. Ruiz San Millan[1], E. Rodrigo Calabia[1], *[1]Nephrology, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain, [2]Clinical Analysis, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain*

6:15 pm **Intensive Blood Pressure Control Preserves Kidney Allograft Function**
K. A. Agarwal[1], U. K. Agarwal[2], G. S. Silva[3], K. J. Pollick[3], M. Pavlakis[1], *[1]Transplant Institute, Beth Israel Deaconess Medical Center, Boston, MA, [2]Biostatistics consultant, Boston, MA, [3]Beth Israel Deaconess Medical Center, Boston, MA*

6:20 pm **Outcomes of Kidney Transplantation in Patients with Prosthetic Heart Valves**
H. Ouahmi, *Nephrology, Dialysis, Transplantation, Nice University Hospital, Nice, France*

6:25 pm **Correlation of Coronary Anatomy and Interventions with Post-kidney Transplantation Outcomes**
A. Sharma, T. Teigeler, D. Kumar, S. Moldowan, C. Bhati, G. Gupta, L. Kang, M. Levy, *Virginia Commonwealth University, Richmond, VA*

6:30 pm **Kidney Transplant Recipients Who Had Covid-19 Prior to Transplant: A Single-center Experience**
S. Sultan, M. Aull, R. Craig-Schapiro, E. C. Liu, J. H. Lee, S. Kapur, *New York Presbyterian / Weill Cornell, New York, NY*

6:35 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Liver
6:00 pm - 7:00 pm

Liver Transplant Oncology
Moderators: Talia Baker, MD, Uchicago Medicine, Director, Liver Transplant Oncology, Chicago, IL, USA, Varvara Kirchner, MD, University of Minnesota, Minneapolis, MN, USA

6:00 pm **Outcomes of Downstaging Hepatocellular Carcinoma (HCC) to within Milan Criteria Before Liver Transplantation (LT): A Multicenter Analysis of the "All-comers" Protocol**
B. Natarajan[1], P. Tabrizian[2], M. Hoteit[3], C. Frenette[4], T. Ghaziani[5], R. Dhanasekaran[5], N. Parikh[6], J. Guy[7], A. Shui[1], S. Florman[2], F. Yao[1], N. Mehta[1], *[1]UCSF, SF, CA, [2]Mt Sinai, NY, NY, [3]U Penn, Philadelphia, PA, [4]Scripps, La Jolla, CA, [5]Stanford, Palo Alto, CA, [6]U Michigan, Ann Arbor, MI, [7]CPMC, SF, CA*

6:05 pm **Role of Baseline PD-1 Checkpoint Inhibitor Pathway Expression in Bridge to Liver Transplant Hepatocellular Carcinoma**
K. Nunez, T. Sandow, M. Hibino, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

6:10 pm **NASH-Related HCC is Associated with Lower Rates of Post-Transplant HCC Recurrence: A Large Database Analysis**
P. J. Altshuler, R. Lamm, K. Patel, H. Dang, O. Shaheen, A. P. Shah, J. Glorioso, C. G. Ramirez, A. M. Frank, W. R. Maley, A. S. Bodzin, *Department of Surgery, Thomas Jefferson University, Philadelphia, PA*

6:15 pm **Adjuvant Immunotherapy for Liver Transplant Recipients with Hepatocellular Carcinoma Using Donor Liver-derived Natural Killer Cells**
M. Ohira[1], R. Hotta[1], Y. Imaoka[1], K. Sato[1], N. Tanimine[1], Y. Tanaka[1], S. Nishida[2], A. Tzakis[2], H. Ohdan[1], *[1]Hiroshima University, Hiroshima, Japan, [2]University of Miami, Miami, FL*

6:20 pm **T Cell Repertoire Diversity in HCV-Associated Hepatocellular Carcinoma Patients Waitlisted for Liver Transplantation and Receiving Liver-Directed Therapy**
K. Nunez, T. Sandow, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

6:25 pm **Living Donor Liver Transplant for Unresectable Colorectal Metastasis: A Case Series**
B. Emmanuel, H. Al-Harakeh, A. Humar, C. Hughes, A. Tevar, M. Molinari, A. Ganoza, *Starzl Transplant Institute, UPMC, Pittsburgh, PA*

6:30 pm **Liver Transplantation for Unresectable Colorectal Cancer Liver Metastases: A Multicenter Experience**
L. I. Ruffolo[1], K. Sasaki[2], K. Tomiyama[1], A. Nair[1], M. Orloff[1], B. Al-Judaibi[3], M. Levstik[3], M. Laryea[3], K. Dokus[1], J. Errigo[1], A. Moro[2], C. Quintini[2], K. Hashimoto[2], M. Fujiki[2], K. Menon[2], C. Kwon[2], T. Diago Uso[2], R. Hernandez-Alejandro[1], F. Aucejo[2], *[1]Surgery, University of Rochester Medical Center, Rochester, NY, [2]Surgery, The Cleveland Clinic Foundation, Cleveland, OH, [3]Transplant Hepatology, University of Rochester Medical Center, Rochester, NY*

6:35 pm **Outcomes of Liver Transplantation for Combined Hepatocellular Cholangiocarcinoma: A Single-center Experience**
Y. Liu[1], C. Hanlon[1], S. Zhou[1], D. Toy[1], K. King[2], K. Zhou[3], J. Kahn[3], L. Yuan[3], *[1]Internal Medicine, USC Keck School of Medicine, Los Angeles, CA, [2]Radiology, USC Keck School of Medicine, Los Angeles, CA, [3]Internal Medicine - Gastrointestinal and Liver Disease, USC Keck School of Medicine, Los Angeles, CA*

6:40 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Pancreas: Small Bowel
6:00 pm - 7:00 pm

Pancreas & Small Bowel
Moderator: Alan Langnas, DO, University of Nebraska Medical Center, Professor of Surgery, Omaha, NE, USA

6:00 pm **Risk Factors for the Development of Posttransplant Lymphoproliferative Disorder (ptld) After Pancreas Transplantation- A Registry Analysis**
A. Gruessner, S. Saggi, J. Renz, R. Gruessner, *SUNY Downstate Medical Center, Brooklyn, NY*

6:05 pm **Evaluation and Experience with Hepatitis C Positive to Negative Pancreas Transplantation**
B. K. Lindner, B. Thomas, M. Cooper, S. Yi, P. Abrams, *Medstar Georgetown University Hospital, Washington, DC*

6:10 pm **Simultaneous Pancreas-kidney Transplantation (spk) and, Simultaneous Deceased Donor Pancreas and Living Donor Kidney Transplantation (splk) in Diabetic Patients with End Stage Renal Disease**
Y. Ko, *Department of Surgery, Asan Medical Center, Seoul, Korea, Republic of*

6:15 pm **Outcomes of Simultaneous Pancreas-Kidney Transplants from Donation After Circulatory Death Donors in the UK: A National Registry Analysis**
N. Karydis[1], M. Ibrahim[2], C. Counter[2], J. Casey[3], P. Friend[4], C. Watson[5], C. Callaghan[1], *[1]Nephrology and Transplantation, Guy's and St Thomas' NHS Foundation Trust, London, United Kingdom, [2]NHS Blood and Transplant, Bristol, United Kingdom, [3]Transplant Unit, Royal Infirmary of Edinburgh, Edinburgh, United Kingdom, [4]Nuffield Department of Surgical Sciences, University of Oxford, Oxford, United Kingdom, [5]Department of Surgery, Addenbrooke's Hospital and Cambridge NIHR Biomedical Research Campus, Cambridge, United Kingdom*

6:20 pm **Two Hundred Total Pancreatectomy with Islet Autotransplantation Cases: A Single Center Experience**
K. Kumano[1], S. Bruer[1], G. Saracino[1], M. Lawrence[1], G. Testa[1], A. Gupta[1], N. Onaca[1], E. Beecherl[1], M. F. Levy[2], B. Naziruddin[1], *[1]Baylor University Medical Ctr, Dallas, TX, [2]Virginia Commonwealth University, Richmond, VA*

6:25 pm **Segmental Susceptibility of Intestinal Stem Cells to Cold Storage Preservation Injury in a Porcine Model**
E. K. Ludwig[1], N. Abraham[2], D. Sudan[2], A. Barbas[2], C. Schaaf[1], J. Freund[1], A. S. Stewart[1], B. Veerasammy[1], L. M. Gonzalez[1], *[1]North Carolina State University, Raleigh, NC, [2]Duke University, Durham, NC*

6:30 pm **Islet Allotransplantation Into Prevascularized Sernova Cell Pouch™ - Preliminary Results from the University of Chicago**
P. J. Bachul[1], P. E. Borek[1], G. S. Generette[1], A. Perez-Gutierrez[1], K. Jayant[1], K. Golab[1], L. Basto[1], L. Perea[1], M. Tibudan[1], C. Thomas[2], L. Philipson[2], J. Fung[1], P. Witkowski[1], *[1]Surgery, University of Chicago, Chicago, IL, [2]Medicine, University of Chicago, Chicago, IL*

6:35 pm **The Impact of Early Narcotic Administration on Intestinal Transplantation Survival at an Urban Medical Center**
L. Maliekal[1], N. Beltran[2], Y. Muszkat[2], S. Nagai[2], S. Jafri[2], *[1]School of Medicine, Wayne State University School of Medicine, Detroit, MI, [2]Department of Gastroenterology, Henry Ford Hospital, Detroit, MI*

6:40 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Kidney
6:00 pm - 7:00 pm

Pediatric Kidney
Moderators: Patrick Healey, MD, Seattle Children's Hospital, Chief, Pediatric Transplant, Seattle, WA, USA, Jaimie Nathan, MD, Cincinnati Children's Hospital Medical Center, Associate Professor of Surgery and Pediatrics, Cincinnati, OH, USA

6:00 pm **Racial and Ethnic Disparities in Pediatric Kidney Transplantation - Has KAS Made a Difference?**
O. Charnaya[1], S. Yu[2], A. Goldberg[3], J. Garonzik-Wang[2], D. Segev[2], P. Verghese[4], *[1]Pediatrics, Johns Hopkins University, Baltimore, MD, [2]Transplant Surgery, Johns Hopkins University, Baltimore, MD, [3]University of Manitoba, Winninpeg, MB, Canada, [4]Northwestern University Feinberg School of Medicine, Chicago, IL*

6:05 pm **Hla Antigens and Recurrence of Focal Segmental Glomerulosclerosis in Pediatric Kidney Transplantation**
B. I. Shaw[1], A. Ochoa[2], C. Chan[2], R. A. Gbadegesin[3], A. M. Jackson[1], E. T. Chambers[3], *[1]Surgery, Duke University, Durham, NC, [2]Biostatistics and Bioinformatics, Duke University, Durham, NC, [3]Pediatrics, Duke University, Durham, NC*

6:10 pm **Kidney Paired Donation in Pediatrics: An Underused Opportunity?**
J. Smith[1], M. Skeans[2], R. Engen[3], S. Bartosh[4], *[1]Seattle Children's Hospital, Seattle, WA, [2]SRTR, Minneapolis, MN, [3]Lurie Children's Hospital, Chicago, IL, [4]Univ of Wisconsin, Madison, WI*

6:15 pm **Drivers of Graft Failure in Pediatric Kidney Transplant Change Over Time**
E. Benz[1], D. Schaubel[2], S. Amaral[1], *[1]Children's Hospital of Philadelphia, Philadelphia, PA, [2]Department of Biostatistics, Epidemiology, and Informatics, University of Pennsylvania, Philadelphia, PA*

6:20 pm **Long Term Safety and Efficacy of Tocilizumab (anti-il6r, Tcz) Therapy in the Treatment of Refractory Chronic Antibody Mediated Rejection (cabmr) in 25 Pediatric Renal Transplant Recipients**
M. Pearl[1], P. Weng[1], A. Dokras[2], H. Pizzo[3], J. Garrison[3], C. Butler[1], J. Q. Zhang[1], K. Lim[3], E. Reed[1], I. Kim[3], M. Haas[3], X. Zhang[3], R. Ettenger[1], S. Jordan[3], D. Puliyanda[3], *[1]Pediatric Nephrology, UCLA Medical Center, Los Angeles, CA, [2]Pediatric Nephrology, UT South Western, Dallas, CA, [3]Pediatric Nephrology, Cedars Sinai Medical Center, West Hollywood, CA*

6:25 pm **Leflunomide Therapy for Treatment of Bk Viremia in Pediatric Kidney Transplant Recipients**
A. Aldieri[1], M. Chandran[2], D. Matossian[3], B. Magella[4], D. Lazear[4], M. Bock[2], E. Blanchette[2], *[1]Children's Hospital Colorado, Denver, CO, [2]Children's Hospital Colorado, Aurora, CO, [3]Ann & Robert H. Lurie Children's Hospital of Chicago, Chicago, IL, [4]Cincinnati Children's Hospital Medical Center, Cincinnati, OH*

6:30 pm **Risk Factors Predicting Outcomes in Long-Term Pediatric Kidney Transplant Graft Survival**
A. Anand, T. H. Malik, J. Dunson, M. F. McDonald, C. R. Christmann, N. Nguyen Galvan, C. O'Mahony, J. A. Goss, P. R. Srivaths, E. D. Brewer, A. Rana, *Baylor College of Medicine, Houston, TX*

6:35 pm **Delayed Graft Function in Pediatric Living Donor Kidney Transplantation**
M. MacConmara, J. Shah, L. de Gregorio, D. Desai, P. Vagefi, C. S. Hwang, *Surgery, UT Southwestern Medical Center, Dallas, TX*

6:40 pm **Live Video Question and Answer**

7:00 pm **Break**

Poster Video Chat

Basic
7:30 pm - 8:30 pm

Biomarkers, Immune Assessment and Clinical Outcomes

Moderators: Alessandro Alessandrini, PhD, Massachusetts General Hospital, Harvard, Assistant Professor, Boston, MA, USA, Sunil Kurian, PhD, Scripps Health, Research Scientist, La Jolla, CA, USA

7:30 pm **Utility of Screening-Bead Assay in Post-Transplant Testing of Donor-Specific Antibodies (DSA) and Antibody-mediated Rejection (ABMR) in Renal Allografts**
A. Agrawal[1], E. Dijke[2], A. Murray[3], P. Campbell[3], *[1]Transplant Nephrology, Mayo Clinic, Rochester, MN, [2]Lab. Medicine and Pathology, University of Alberta Hospital, Edmonton, AB, Canada, [3]Division of Nephrology, Dept. of Medicine, University of Alberta Hospital, Edmonton, AB, Canada*

7:40 pm **A Multimodal Interrogation of Human Renal Allografts**
D. Dadhania[1], R. Ding[1], H. Xu[2], C. Lee[1], C. Snopkowski[1], T. Salinas[1], T. Muthukumar[1], J. Lee[1], R. Woodward[2], M. Grskovic[2], S. Dholakia[2], M. Suthanthiran[1], *[1]Weill Cornell Medicine - NYPH, New York, NY, [2]CareDx, New York, NY*

7:50 pm **A Patient-Centered Perspective on Progress in Transplantation**
B. Hickner[1], N. Galvan[2], R. Cotton[2], C. O'Mahony[2], J. Goss[2], A. Rana[2], *[1]Department of Student Affairs, Baylor College of Medicine, Houston, TX, [2]Department of Surgery, Baylor College of Medicine, Houston, TX*

8:00 pm **Peripheral Blood Inflammatory Chemokines Uncover Rejection in the Absence of Histological Lesions**
E. Van Loon[1], T. Barba[2], B. Lamarthée[1], A. Senev[1], O. Thaunat[2], D. Schols[3], M. Naesens[1], *[1]Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium, [2]Department of Transplantation, Nephrology and Clinical Immunology, Edouard Herriot Hospital Lyon, Lyon, France, [3]Laboratory of Virology and Chemotherapy, KU Leuven, Leuven, Belgium*

8:10 pm **Live Video Question and Answer**

Poster Video Chat

Heart
7:30 pm - 8:30 pm

Heart/LVAD: All Topics
Moderators: Leway Chen, MD, MPH, U of Rochester Medical Center, Medical Director, Advanced Heart Failure Program, Rochester, NY, USA, Sara Shumway, MD, Univ of Minnesota Hosp, Minneapolis, MN, USA

7:30 pm **Clinical Features and Outcomes of Candidemia in Patients with Left Ventricular Assist Devices**
G. Krishnan, Y. Hamad, I. George, *Infectious Diseases, Washington University School of Medicine, St Louis, MO*

7:40 pm **Significance of Repeated 1r Rejections in Heart Transplantation**
C. Hsueh[1], L. Wilson[2], L. Bow[2], L. Bellumkonda[2], *[1]Yale New Haven Hospital, New Haven, CT, [2]Yale University School of Medicine, New Haven, CT*

7:50 pm **When is the Optimal Time to Initiate the Renal-Sparing Protocol with Calcineurin Inhibitor Withdrawal?**
N. Patel, M. Kittleson, J. Patel, T. Singer-Englar, S. Kim, D. Chang, B. Azarbal, A. Nikolova, L. Czer, F. Esmailian, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

8:00 pm **Are Pre-Transplant Diabetics on ACE Inhibitors at Risk for More Renal Dysfunction After Heart Transplantation?**
M. Kittleson, J. Patel, D. Chang, N. Patel, S. Kim, T. Singer-Englar, R. Skorka, A. Hage, L. Czer, F. Esmailian, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

8:10 pm **Management of Drug Interactions During Protocolized Implementation of Posaconazole Immediately Post Heart Transplant**
G. Waldman, C. Rogers Marks, J. Clark, A. Woo, L. Irwin, A. Gerlach, G. D. Lewis, J. A. Fishman, *Massachusetts General Hospital, Boston, MA*

8:20 pm **Live Video Question and Answer**

Poster Video Chat

Kidney
7:30 pm - 8:30 pm

Kidney Deceased Donor Allocation 1
Moderators: Stuart Flechner, MD FAST, Cleveland Clinic Lerner College of Medicine, Professor pf Surgery, Cleveland, OH, USA, Joshua Weiner, MD, Columbia University Irving Medical Center, Assistant Professor of Surgery, New York, NY, USA

7:30 pm **Donor-Recipient BSA Matching is Prognostically Significant in Solitary and En-bloc Kidney Transplantation from Pediatric Circulatory Death Donors**
C. J. Little, A. A. Dick, J. D. Perkins, J. D. Reyes, *Department of Surgery, University of Washington, Seattle, WA*

7:40 pm **Characterizing the Early Impact of the Kidney Accelerated Placement Project on Hard-to-place Kidneys**
J. D. Motter, A. Kernodle, M. Levan, D. Segev, J. Garonzik-Wang, A. Massie, *Johns Hopkins University, Baltimore, MD*

7:50 pm **Comparison of Outcomes of Hepatitis C Virus (hcv) Nucleic Acid (nat) Positive Donor Between Hcv-naïVe and Hcv + Recpients - A Donor Mate Analysis**
J. Kamal, B. Sharma, A. Doyle, A. Kumar, A. Nishio-Lucar, S. Rao, *University of Virginia, Charlottesville, VA*

8:00 pm **Centers Avoided 67% of Kidney Offers by Participating in the OPTN's Multifactorial Offer Filter Pilot Project**
A. Toll, H. McGehee, D. Stewart, R. McTier, *Research, United Network for Organ Sharing, Richmond, VA*

8:10 pm **Can Procurement Biopsy Data Tell Us Anything? The Influence of Glomerulosclerosis on Long-term Kidney Graft Survival**
D. Stewart[1], L. Kamal[2], J. Foutz[3], H. McGehee[3], P. Saravanane[2], S. Yu[2], R. Yousfi[2], G. Gupta[2], *[1]United Network for Organ Sharing, Richmond, VA, [2]Virginia Commonwealth University Health, Richmond, VA, [3]Research, United Network for Organ Sharing, Richmond, VA*

Pancreas & Small Bowel
7:30 pm - 8:30 pm

Pancreas & Small Bowel
Moderators: Kishore Iyer, FACS, MBBS, FRCS, Mount Sinai Hospital/Icahn School of Medicine at Mount Sinai, Professor of Surgery & Pediatrics, New York, NY, USA, Stephanie Yi, MD, MPH, Houston Methodist Hospital, Transplant Surgeon, Houston, TX, USA

7:30 pm **Do Pretransplant C-peptide Levels Influence Outcomes in Simultaneous Pancreas-Kidney Transplantation? A Matched Case-Control Study**
K. B. Gurung, V. Gurram, J. Rogers, A. C. Farney, G. Orlando, C. L. Jay, A. Reeves-Daniel, A. Mena-Gutierrez, N. Sakhovskaya, W. Doares, S. Kaczmorski, M. D. Gautreaux, R. J. Stratta, *Abdominal Transplant Surgery, Wake Forest Baptist Medical Center, Winston-Salem, NC*

7:40 pm **Peri-covid Trends on the Intestinal Transplant Waiting List**
M. L. Samoylova[1], S. Jafri[2], M. I. Fiel[3], S. Horslen[4], A. Mavis[5], T. Schiano[6], B. Summers[7], M. C. Segovia[8], *[1]Surgery, Duke University, Durham, NC, [2]Gastroenterology and Hepatology, Henry Ford Hospital, Detroit, MI, [3]Pathology, Mount Sinai, New York, NY, [4]Transplantation, Seattle Children's Hospital, Seattle, WA, [5]Pediatric Gastroenterology, Duke University, Durham, NC, [6]Hepatology, Mount Sinai Medical Center, New York, NY, [7]Pharmacy, Henry Ford Hospital, Detroit, MI, [8]Gastroenterology, Duke University, Durham, NC*

7:50 pm **Prevalence of Diabetic Changes on Kidney Allograft Biopsies of Normoglycemic Simultaneous Pancreas-Kidney Transplant Recipients**
C. Mejia, G. Giannini, D. C. Brennan, A. Rosenberg, S. Alasfar, *Johns Hopkins University, Baltimore, MD*

8:00 pm **Evaluation of Preperitoneal Space as an Extrahepatic Transplant Site in Clinical Total Pancreatectomy with Islet Autotransplantation**
K. Kumano, B. Naziruddin, S. Bruer, G. Saracino, M. Lawrence, G. Testa, A. Gupta, E. Beecherl, N. Onaca, *Baylor University Medical Ctr, Dallas, TX*

8:10 pm **Simultaneous Pancreas-Kidney Transplantation in Caucasian versus African American Patients: Does Recipient Ethnicity Influence Outcomes?**
J. Rogers[1], A. Farney[2], G. Orlando[2], C. Jay[2], K. Gurung[2], B. Sharda[2], A. Reeves-Daniel[3], A. Mena-Gutierrez[3], N. Sakhovskaya[3], W. Doares[4], S. Kaczmorski[4], M. Magid[4], M. Gautreaux[2], R. Stratta[2], *[1]Wake Forest Baptist Medical Center, Winston-Salem, NC, [2]Department of Surgery, Wake Forest Baptist Medical Center, Winston-Salem, NC, [3]Internal Medicine, Wake Forest Baptist Medical Center, Winston-Salem, NC, [4]Department of Pharmacy, Wake Forest Baptist Medical Center, Winston-Salem, NC*

Kidney
8:45 pm - 9:30 pm

What is the Big Deal with a Little Fatty Liver in a Living Kidney Donor Candidate?

Moderators: Vineeta Kumar, MD, University of Alabama At Birmingham, Professor of Medicine, Endowded Professor in Transplant Nephrology, Birmingham, AL, USA, AnnMarie Liapakis, MD, Yale School of Medicine, Digestive Disease, Medical Director Living Donor Liver Transplant Yale New Haven Transplantation Center, New Haven, CT, USA

8:45 pm **Non-alcoholic Fatty Liver Disease and Chronic Kidney Disease**
William Asch, MD, PhD, Yale New Haven Transplantation Center, Associate Professor of Medicine and Surgery, New Haven, CT, USA

8:55 pm **Non-alcoholic Fatty Liver Disease: Update for the Non-hepatologist**
Wajahat Mehal, MD, PhD, Yale School of Medicine

9:05 pm **Live Video Question and Answer**

Expert VIP Meet Up

Kidney
8:45 pm - 9:30 pm

Cytomegalovirus Prevention: Best Practices and Emerging Innovations

Moderators: Abhijit (Ajit) Limaye, MD, University of Washington, Professor of Medicine, Seattle, WA, USA, Jonathan Maltzman, MD, PhD, FAST, Stanford University, Associate Professor, Palo Alto, CA, USA

8:45 pm **CMV Serostatus and Outcomes in Kidney Transplantation**
Martha Pavlakis, MD, FAST, FASN, Beth Israel Deaconess Medical Center, Medical Director, Kidney and Pancreas Transplantaion, Boston, MA, USA

8:55 pm **An Economic Analysis of CMV Seromatching in Kidney Transplantation**
David Axelrod, MD, MBA, University of Iowa, Professor of Surgery, Iowa City, IA, USA

9:05 pm **CMV Matching in Deceased Donor Kidney Transplantation: Waitlist and Patient Outcomes**
Joe Lockridge, MD, Portland VA - Oregon Health and Sciences University, CMV Matching in Deceased Donor Kidney Transplantation: Waitlist and Patient Outcomes, Portland, OR, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Liver
8:45 pm - 9:30 pm

Minimal Invasive Surgery in Living Donor Liver Transplantation

Moderators: Dean Kim, MD FACS, Henry Ford Health System, Surgical Director, Kidney and Pancreas Transplantation, Detroit, MI, USA, David Mulligan, MD FACS, FAASLD, FAST, Yale University/Yale New Haven Health System, Professor and Chair, Transplantation and Immunology, New Haven, CT, USA

8:45 pm **How To Incorporate Advanced Minimal Invasive Technique In A Transplant Program and Training Tools**
Atsushi Yoshida, MD, FACS, Henry Ford Hospital, Detroit, MI, USA

8:55 pm **Minimal Invasive Live Donor Hepatectomy : Laparoscopic Approach**
Benjamin Samstein, MD, Weill Cornell Medical Center, Chief of Liver Transplantation, New York, NY, USA

9:05 pm **Minimal Invasive Live Donor Hepatectomy : Robotic Approach**
Yee Lee J. Cheah, MD, Lahey Hospital & Medical Center, Director, Living Donor Liver Transplantation, Burlington, MA, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Liver
8:45 pm - 9:30 pm

The Role of Exercise in Advanced Liver Disease

Moderators: Puneeta Tandon, MD, FRCP(C), MSc, University of Alberta, Associate Professor, Edmonton, AB, Canada, Jennifer Lai, MD/MBA, University of California, San Francisco, Exercise in Liver Transplantation, San Francisco, CA, USA

8:45 pm **The Exercise Prescription in ESLD: Establishing a Prehabilitation Program**
Andres Duarte-Rojo, MD MS DSc, University of Pittsburgh Medical Center, Pittsburgh, PA, USA

8:55 pm **Impact of Frailty and Sarcopenia on Pre- and Post-transplant Outcomes**
Elizabeth Carey, MD, Mayo Clinic Scottsdale, Phoenix, AZ, USA

9:05 pm **When and How to Provide Specialized Nutritional Support**
Jeanette Hasse, PhD, RD, Baylor University Medical Center, Transplant Nutrition Manager, Dallas, TX, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Liver
8:45 pm - 9:30 pm

The Kidney in Liver Disease

Moderators: Josh Levitsky, MD, MS, Northwestern, Professor of Medicine, Chicago, IL, USA, Marina Serper, MD, MS, UPenn, Assistant Professor of Medicine, Philadelphia, PA, USA

8:45 pm **Re (de) fining the Role of Renal Replacement Therapy in Liver Disease**
Mitra Nadim, MD, University of Southern California, Professor of Clinical Medicine, Los Angeles, CA, USA

8:55 pm **Adding Insult to Injury: Role of Biomarkers in Acute Kidney Injury and Dual Organ Transplantation**
Claire Francoz, Beaujon Hospital

9:05 pm **End of Road for Serum Creatinine? Time to Revise the MELD Score**
Sumeet Asrani, MD MSc, Baylor University Medical Center, Transplant Hepatology, Dallas, TX, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Heart: Lung
8:45 pm - 9:30 pm

Complex Thoracic Desensitization Cases: What makes Sense?

8:45 pm **Complex Desensitization Cases**
Jon Kobashigawa, MD, Cedars-Sinai Smidt Heart Institute, Director, Cedars-Sinai Heart Transplant Program, Los Angeles, CA, USA

8:55 pm **Complex Desensitization Cases**
Anat Tambur, PhD, DMD, Northwestern University, Chicago, IL, USA

9:05 pm **Complex Desensitization Cases**
Ramsey Hachem, MD, Washington University of St. Louis, Professor of Medicine, St. Louis, MO, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Small Bowel
8:45 pm - 9:30 pm

Quality of Life after Intestine Transplant

Moderators: David Mercer, MD, FRCSC, PhD, University of Nebraska Medical Center, Professor of Surgery, Omaha, NE, USA, Mercedes Martinez, MD, Columbia University, Associate Professor of Pediatric and Medicine, New York, NY, USA

8:45 pm **Pain management after intestine transplant – the pharmacist perspective**
Bryant Summers, Pharm D, Henry Ford Hospital, Transplant Pharmacist, Detroit, MI, USA

8:50 pm **Psychological obstacles in adults after intestine transplant**
Benson Hoffman, Ph.D., Duke University, Associate Clinical Professor of Psychiatry and Behavioral Sciences, Durham, NC, USA

8:55 pm **Growth and socialization in children after intestine transplant**
Jennifer Garcia, MD, Miami Transplant Institute, University of Miami, Medical Director, Adult and Pediatric Intestinal Transplant, Miami, FL, USA

9:00 pm **Live Video Question and Answer**

Expert VIP Meet Up

Pancreas: Prof Develop
8:45 pm - 9:30 pm

Expanding your Pancreas Transplant Program

Expert VIP Meet Up

ID
8:45 pm - 9:30 pm

Controversies and Updates in Management of Hepatitis B Virus in Solid Organ Transplantation

Moderators: Kapil Saharia, M.D, University of Maryland School of Medicine, Assistant Professor, Baltimore, MD, USA, Nicole Theodoropoulos, MD, MS, University of Massachusetts Medical School, Associate Professor, Worcester, MA, USA

8:45 pm **Controversies and Updates in HBV Management**
Josh Levitsky, MD, MS, northwestern, Professor of Medicine, Chicago, IL, USA

8:50 pm **Pro: Use of HBsAg Positive Donors - Safe Expansion of the Donor Pool**
Paolo Antonio Grossi, MD, PhD, University of Insubria, Professor of Infectious Diseases, Varese, Italy

8:55 pm **Con: HBsAg Positive Donors: Too much risk for HBV Negative Recipients**
Karen Doucette, MD, MSc, University of Alberta, Professor of Medicine, Edmonton, AB, Canada

9:00 pm **Live Video Question and Answer**

Expert VIP Meet Up

Pediatric
8:45 pm - 9:30 pm

Recurrent Disease in Pediatric Transplantation

Moderators: Sharad Wadhwani, MD MPH, University of California San Francisco, Assistant Professor of Pediatrics, Oakland, CA, USA, Daniella Levy Erez, MD MTR, Schneider Children's Medical Center, Israel, Attending Physician, Petach Tikva, Israel

8:45 pm **Non Pharmacologic Strategies to Prevent Recurrent Kidney Disease**
Priya Verghese, MD, MPH, Ann & Robert H. Lurie Children's Hospital of Chicago, Professor, Division Head, Chicago, IL, USA

8:55 pm **Therapeutic Advancements for the Pharmacologic Management of Recurrent Disease**
Michael Somers, MD, Boston Children's Hospital, Associate Chief, Division of Nephrology, Boston, MA, USA

9:05 pm **Recurrent Diseases in Pediatric Transplantation: Who, What, and Why**
Sharon Bartosh, MD, University of Wisconsin, Professor of Pediatrics, Madison, WI, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Women's Health
8:45 pm - 9:30 pm

Uterus Transplantation - Meet the New Kid on the Block

Moderators: Andreas Tzakis, MD, Cleveland Clinic, Emeritus Director Transplantation Enterprise, Cleveland, OH, USA, Giuliano Testa, MD, FACS, MBA, Simmons Transplant Institute, MD, Dallas, TX, USA

8:45 pm **Uterus Donors - Living, Diseased, and Selection**
Liza Johannesson, MD, PhD, Baylor University Medical Center, Medical Director, Uterus Transplantation, Dallas, TX, USA

8:55 pm **Filling Knowledge Gaps with Uterus Transplantation Research**
Paige Porrett, MD, PhD, University of Alabama at Birmingham, Associate Professor of Surgery; Director of VCA Transplantation at UAB, Birmingham, AL, USA

9:05 pm **Uterus Reproductive Endocrinology and Supply/Demand for Uterus Transplantation**
Cristiano Quintini, MD, Cleveland Clinic, Director, Uterus Transplantation, Cleveland, OH, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Public Policy
8:45 pm - 9:30 pm

The Practical Implementation of Imminent Death Donation

Moderators: Paul Morrissey, MD, Rhode Island Hospital, Professor of Surgery, Providence, RI, USA, Joshua Mezrich, MD, University of Wisconsin, X, Madison, WI, USA

8:55 pm **What are the Barriers to Implementation of Imminent Death Donation**
N. Thao Galvan, MD, MPH, FACS, Baylor College of Medicine, Assistant Professor, Houston, TX, USA

8:45 pm **Engaging the Stakeholders that Need to be Involved with the Development of Imminent Death Donation**
Kevin Myer, MSHA, LifeGift, CEO, Houston, TX, USA

9:05 pm **The Practical Implementation of Imminent Death Donation**
Tim Pruett, MD, University of Minnesota, Professor of Surgery and Internal Medicine, Minneapolis, MN, USA

9:15 pm **Live Video Question and Answer**

Expert VIP Meet Up

Other

Kidney
9:00 am - 10:00 am

TCMR After Kidney Transplantation in 2021: Are We Moving Forward?
Moderators: Peter Nickerson, MD, University of Manitoba, Distinguished Professor, Vice Dean (Research), Winnipeg, MB, Canada, Roslyn Mannon, MD, University of Nebraska Medical Center, Professor of Medicine, Omaha, NE, USA

9:00 am **Innovative Therapies in Horizon for the Treatment of TCMR.**
Flavio Vincenti, MD, University of California San Francisco, Professor of clinical medicine, San Francisco, CA, USA

9:10 am **Strengths and Limitations of Histology**
Mark Haas, MD, PhD, Cedars-Sinai Medical Center, Dept. of Pathology, Attending Pathologist, Professor, Los Angeles, CA, USA

9:20 am **Clinical and Sub-clinical TCMR in 2019 and its Relevance to Clinicians and Researchers**
Sundaram Hariharan, MD, Starzl Transplant Institute, Univ of Pittsburgh Med Center, Professor of Medicine and Surgery, Pittsburgh, PA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Kidney
9:00 am - 10:00 am

Blood Pressure Screening and Associated Outcomes in Living Kidney Donors
Moderators: Nagaraju Sarabu, MD, University Hospitals Cleveland Medical Center, MD, Cleveland, OH, USA, Brian Lee, MD, University of Texas in Austin, Professor in Medicine, Austin, TX, USA

9:00 am **Post-donation Outcomes Related to Hypertension in Living Kidney Donors**
Asif Sharfuddin, Indiana University School of Medicine, Indianapolis, IN, USA

9:10 am **Interpreting Blood Pressure in Living Donor Candidates: How to Measure? What Cutoffs to Use?**
Joshua Augustine, MD, Cleveland Clinic Foundation, Cleveland, OH, USA

9:20 am **Update on National Guidelines for Hypertension and Monitoring for Hypertension in the General Population**
Sandra Taler, MD, Mayo Clinic, Professor of Medicine, Nephrology and Hypertension, Rochester, MN, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Liver
9:00 am - 10:00 am

Evolution of Living Liver Donation in North America: 2020 and Beyond
Moderators: Amit Mathur, MD MS FACS, Mayo Clinic in Arizona, Associate Professor of Surgery, Consultant, Division of Transplant Surgery, Phoenix, AZ, USA, Mark Cattral, MD, MSc, Toronto General Hospital, Professor of Surgery, Toronto ON, Canada

9:00 am **Successes and Challenges in Developing Non-Directed Liver Donation Programs: Donor Safety and Recipient Selections**
Nazia Selzner, MD PhD, Toronto, ON, Canada

9:10 am **Living Donor Liver Transplantation in North America: Where are we Going?**
Tarunjeet Klair, MD, University of Texas Health San Antonio, Assistant Professor of Surgery, Director Living Donor Liver Trasnsplantation, San Antonio, TX, USA

9:20 am **Implementation of Paired Liver Donation in a LDLT Program**
Nabil Dagher, MD, NYU Langone Transplant Institute, Chief, Abdominal Transplant Surgery Program, New York, NY, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Heart
9:00 am - 10:00 am

Examine Well Your Blood: Heart Transplant Management Without a Biopsy

Moderators: Howard Eisen, MD, Pennsylvania State University, Medical Director, Advanced Heart Failure and Transplant Programs, Hershey, PA, USA, Shelley Hall, MD, Baylor University Medical Center, Chief, Transplant Cardiology, MCS and Adv HF, Dallas, TX, USA

9:00 am **The Coast is Clear: Gene Expression Profiling for Asymptomatic Screening**
Mario Deng, MD, UCLA

9:10 am **All's Quiet on the Western Front**
Kiran Khush, MD, Stanford, Professor of Medicine, Stanford, CA, USA

9:20 am **Enter the Exosome**
Prashanth Vallabhajosyula, MD, MS, Yale University School of Medicine, Associate Professor of Surgery, New Haven, CT, USA

9:30 am **Putting It All Together**
Cesar Guerrero-Miranda, MD, FACC, Baylor University Medical Center, Advanced Heart Failure and Transplant Cardiologist, Dallas, TX, USA

9:40 am **Live Video Question and Answer**

IMPACT Sessions

Pediatric
9:00 am - 10:00 am

What is This Spot on My…….? What Every Transplant Physician should know about Treating Skin Problems in Pediatric Transplant Patients

Moderators: Joshua Blatter, MD, MPH, Washington University School of Medicine in St. Louis, Assistant Professor, Saint Louis, MO, USA, Cadence Kuklinski, DO, Washington University, Saint Louis, MO, USA

9:00 am **It's Spreading: Common Infectious Skin Lesions after Transplantation**
Bernard Cohen, MD, Johns Hopkins University, Professor of Pediatrics and Dermatology, Baltimore, MD, USA

9:10 am **I was Fine Before I Started Taking that Drug: Common Drug Related Skin Reactions in Transplantation**
Nicole Pilch, PharmD, MS, BCPS, Medical University of South Carolina, Charleston, SC, USA

9:20 am **Picture This: Dermatologic Case Review and Treatment Options**
Carrie Coughlin, MD, Washington University School of Medicine St. Louis, St. Louis, MO, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Basic
9:00 am - 10:00 am

Ischemia Reperfusion-Alloimmunity Interface

Moderators: Robert Fairchild, PhD, Cleveland Clinic, Professor of Molecular Medicine, Cleveland, OH, USA, Anita Chong, PhD, The University of Chicago Medicine, Professor, Chicago, IL, USA

9:00 am **IRI and Tolerance**
Anna Valujskikh, PhD, The Cleveland Clinic Fdn, Cleveland, OH, USA

9:10 am **IRI, Complement and the Allo-immune Response**
Dan Jane-wit, MD, PhD, Yale University School of Medicine, Assistant Professor, New Haven, CT, USA

9:20 am **Hepatic C-CAM-1 Expression Indicates Donor Quality and Predicts IRI Injury in Liver Transplant**
Jerzy Kupiec-Weglinski, MD, PhD, UCLA Medical Center, Professor of Surgery, Los Angeles, CA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Translational
9:00 am - 10:00 am

Spatial and Single Cell Profiling in Transplant Immune Injury

Moderators: Vikas Dharnidharka, MD, MPH, Washington University, Professor and Vice-Chair, Pediatrics, St. Louis, MO, USA, MIchael Mengel, MD, University of Alberta, Professor, Edmonton, AB, Canada

9:00 am **To Know What Single Cell RNA Sequencing Technology Is**
Benjamin Humphreys, MD, PhD, Washington University, Friedman Professor and Chief of Nephrology, St. Louis, MO, USA

9:10 am **Single Cell Transcriptomics in Renal Transplant**
Menna Clatworthy, PhD MD FRCP FMedSci, University of Cambridge, Professor of Translational Immunology, cambridge, United Kingdom

9:20 am **Single Cell Imaging Analysis and Integration with Single Cell Transcriptomics**
Andrew Malone, MD, Washington University School of Medicine, Assistant Professor, St Louis, MO, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

ID
9:00 am - 10:00 am

Is the Microbiome a Therapeutic Target in Transplantation?

Moderators: Elizabeth Verna, MD, MS, Hartsdale, NY, USA, Carlos Gomez, MD, University of Utah School of Medicine, Assistant Professor, Salt Lake City, UT, USA

9:00 am **Microbiome 101: What is it, How do you Measure it, and Why is it Important?**
Jasmohan Bajaj, MD, Virginia Commonwealth University, Professor, Richmond, VA, USA

9:10 am **Restoring the Microbiome to Prevent and Treat Infection**
Sahil Khanna, MBBS, MS, Mayo Clinic, Professor of Medicine, Rochester, MN, USA

9:20 am **Targeting the Microbiome to Prevent Post-Transplant Metabolic Disease and Rejection**
Mamatha Bhat, MD, PhD, University Health Network, Assistant Professor of Medicine, Toronto, ON, Canada

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pharmacy: Pediatric
9:00 am - 10:00 am

The Road Less Traveled: Experience with Unique Immunosuppression in Pediatric Transplantation

9:10 am **Proliferation Signal Inhibitor Avenue: Use of mTORi/PSI Immunosuppression in Pediatric Heart Transplantation**
Kevin Daly, MD, Children's Hospital Boston, Assistant Professor of Pediatrics, Boston, MA, USA

9:00 am **Belatacept Lane: Use of Belatacept in Pediatric Kidney Transplantation**
Rochelle Liverman, Pharm.D., Children's Healthcare of Atlanta, Transplant Pharmacist Specialist, Atlanta, GA, USA

9:20 am **Tacrolimus Highway: Use of Extended Release Tacrolimus Products in Pediatric Heart, Liver, and Kidney Transplantation**
Mary Chandran, PharmD, Children's Hospital Colorado, Clinical Pharmacy Specialist, Denver, CO, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Public Policy
9:00 am - 10:00 am

Doctors, Patients, Lawyers, and Legislators: Who Decides for Whom?

Moderators: Ryutaro Hirose, MD, Univ of California-San Francisco, Professor, San Francisco, CA, USA, Jeffrey Edelman, MD, University of Washington, Associate Professor, Seattle, WA, USA

9:00 am **How Do We Define and Measure Transplant Benefit**
Elisa Gordon, PhD, MPH, Northwestern U Feinberg Sch of Medicine, Professor, Oak Park, IL, USA

9:10 am **What Forces Govern and Influence Organ Allocation Policy**
Yolanda Becker, MD, University of Chicago, Professor of Surgery, CHICAGO, IL, USA

9:20 am **What is Continuous Distribution and Why is it the Way to Go?**
Kevin O'Connor, MS, Life Center Northwest, President & CEO, Bellevue, WA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Ethics
9:00 am - 10:00 am

Palliative Care & Solid Organ Transplantation: A Spectrum of Care

Moderators: Kristin Kuntz, Ph.D., The Ohio State University Medical Center, Associate Professor of Psychiatry, Columbus, OH, USA, Nicole McCormick, DNP, MBA, NP-C, CCTC, University of Colorado, Assistant Professor, Denver, CO, USA

9:00 am **Overview of Palliative Care**
Brittany Waterman, MD, The Ohio State University Wexner Medical Center, Assistant Professor, Columbus, OH, USA

9:10 am **Palliative Care in the Pre-Transplant Setting**
Kristin Kronsnoble, PhD, Transplant Psychology, Tampa General Hospital, Director, Transplant Psychology, Tampa, FL, USA

9:20 am **Palliative Care in the Post-Transplant Setting**
Maha Mohamed, Medical Doctor (MD), Department of Nephrology, Associate Professor, Madison, WI, USA

9:30 am **Live Video Question and Answer**

10:00 pm **Break**

Plenary Session 2

10:30 am - 11:30 am

Moderators: Emily Blumberg, MD, FAST, University of Pennsylvania, Philadelphia, PA, USA, Lloyd Ratner, MD, MPH, Columbia University, Professor of Surgery; Director-Renal & Pancreatic Transplantation, New York, NY, USA

10:30 am **Trends in Mortality Among Solid Organ Transplant Recipients Hospitalized for Covid-19 During the Course of the Pandemic**
M. R. Heldman, O. S. Kates, R. M. Rakita, E. D. Lease, C. E. Fisher, A. P. Limaye, University of Washington, Seattle, WA, USA

10:40 am **Treg Engagement of Lymphotoxin Beta Receptor in Lymphatic Endothelial Cells is Required for Allograft Protection**
V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], [1]U Maryland, Baltimore, MD, USA, [2]Harvard U, Boston, MA, USA

10:50 am **DCD Heart Donation: Impact on Organ Yield**
K. Gauntt, B. Carrico, D. Klassen, United Network for Organ Sharing, Richmond, VA, USA

11:00 am **Anti-CD8 Immuno-PET for Non-invasive Tracking of Early Graft Rejection in a Non-human Primate Kidney Transplant Model**
K. Bruestle[1], R. Tavare[2], F. Fredriksson[1], E. Duggan[1], F. Huang[1], B. Bhola[1], J. Giurleo[2], R. Foster[2], P. Krueger[2], M. Dobosz[2], D. Ekanayake-Alper[1], H. Sakai[1], B. Piegari[1], J. Castrillion[1], S. M. Coley[1], O. Harari[2], A. Mintz[1], D. Ma[2], A. Griesemer[1], [1]Columbia University Medical Center, New York City, NY, USA, [2]Regeneron Pharmaceuticals, Inc, New York City, NY, USA

11:10 am **Live Video Question and Answer**

Sponsor Networking

11:30 am - 12:00 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Natera - Prospera: The Power & Potential of cell-free DNA in Transplantation & Oncology

Sanofi - One Year Later: Vaccines, Transplant, and Where We Go From Here - A Conversation with Dr Dorry Segev

Talaris Therapeutics - FCR001 Investigational Cellular Therapy in Living Donor Kidney Transplantation

Veloxis - Real World Application of ENVARSUS XR® (PART 2) – Conversion Dosing and Monitoring

Presidential Addresses

12:00 pm - 12:30 pm

AST Presidential Address

12:00 pm **Introduction**
Emily Blumberg, MD, FAST, University of Pennsylvania, Philadelphia, PA, USA

12:10 pm **Presidential Address**
Richard Formica, MD, FAST, Yale Univ School of Medicine, New Haven, CT, USA

Society Awards

12:30 pm - 1:30 pm

AST Achievement Awards & Lifetime Achievement Awards

12:30 pm **2020 Transplant Advocacy Award and Lifetime Achievement Awards**
Emily Blumberg, MD, FAST, University of Pennsylvania, Philadelphia, PA, USA

1:00 pm **2021 Award Presentations**
Richard Formica, MD, Yale Univ School of Medicine, New Haven, CT, USA

Satellite Symposia

1:30 pm - 2:30 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Updates in the Diagnosis and Management of Chronic Active Antibody Mediated Rejection

Supported by CSL Behring

AlloSure Lung: Donor-Derived Cell-Free DNA as an Innovative Biomarker for Lung Transplant Patients

Supported by CareDx

Let's Get "Real": Strategies to Reduce Rejection in Renal Transplantation – Applying the Evidence to Real World Scenarios

Supported by an independent educational grant from Sanofi

IMPACT Sessions

COVID-19

3:00 pm - 4:00 pm

Late-Breaking: COVID Vaccination and Immunotherapy in Transplant Patients

Moderators: Tim Pruett, MD, University of Minnesota, Professor of Surgery and Internal Medicine, Minneapolis, MN, USA, Andre Dick, MD, MPH, University of Washington School of Medicine Seattle, Associate Professor of Surgery, Seattle, WA, USA

3:00 pm **A US-wide study of COVID Vaccine Safety, Immune Response, and Durability in 3000 Transplant Patients**
Dorry Segev, MD, PhD, Johns Hopkins University, Professor of Surgery and Epidemiology, Baltimore, MD, USA

3:15 pm **Immunotherapy and Immunomodulation for COVID-19 in Transplant Patients**
Robin Avery, MD, Johns Hopkins, Professor of Medicine, Baltimore, MD, USA

3:30 pm **Making Sense of Vaccine and COVID Outcomes for Up to Date Clinical Recommendations**
Michael Ison, MD, MS, Northwestern University Feinberg SoM, Professor, Chicago, IL, USA

3:45 pm **Live Video Question and Answer**

IMPACT Sessions

Kidney

3:00 pm - 4:00 pm

Role of Genetic Testing in Potential Living Donor Candidates

Moderators: Brian Lee, MD, University of Texas in Austin, Professor in Medicine, Austin, TX, USA, Ethan Marin, MD, PhD, Regeneron Pharmaceuticals, Associate Medical Director, New Haven, CT, USA

3:00 pm **NGS, WES, WGS - The Genomic Era for Nephrologic Diagnosis and Therapy vis-à-vis Living Kidney Donation**
Ali Gharavi, M.D., Columbia University, Professor Of Mediicne, Chief Div Of Nephrology, New York, NY, USA

3:10 pm **Genetic Implications for Living Kidney Donors with a Family History of ADPKD and other Inheritable Kidney Diseases**
Meyeon Park, MD MAS, UCSF, Associate Professor, San Francisco, CA, USA

3:20 pm **Ethical Stewardship in Genetic Testing of Living Kidney Donors - Are We Crossing the Rubicon?**
Christie Thomas, MD, University of Iowa, Iowa City, IA, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Kidney
3:00 pm - 4:00 pm

Medical Risks in Young Donors

Moderators: Anuja Java, MD, Washington University School of Medicine in St. Louis, MO, Assistant Professor Of Medicine, Saint Louis, MO, USA

3:00 pm **Pregnancy Risks after Live Kidney Donation**
Arthur Matas, MD, University of Minnesota Medical School, Professor of Surgery, Minneapolis, MN, USA

3:10 pm **Assessing Emotional Maturity and Readiness to Consent as an Organ Donor**
Sheila Jowsey-Gregoire, MD, Mayo Clinic, Associate Professor of Psychiatry, Rochester, MN, USA

3:20 pm **Medical Risks in Young Donors**
Robert Steiner, MD, UCSD Medical Center, Transplant Nephrology, San Diego, CA, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Liver
3:00 pm - 4:00 pm

Responsible Expansion of Living Donor Liver Transplantation in the United States

Moderators: Whitney Jackson, MD, University of Colorado, Aurora, CO, USA, Kim Olthoff, MD, University of Pennsylvania, Donald Guthrie Professor of Surgery, Chief Division of Transplant Surgery, Philadelphia, PA, USA

3:00 pm **Obesity & Metabolic Considerations: Iron Discussions**
AnnMarie Liapakis, MD, Yale School of Medicine, Digestive Disease, Medical Director Living Donor Liver Transplant Yale New Haven Transplantation Center, New Haven, CT, USA

3:10 pm **The Hypercoaguable Work up of a Living Liver Donor - What's Revelant and Necessary?**
Whitney Jackson, MD, University of Colorado, Medical Director, Living Donor Liver Transplantation, Denver, CO, USA

3:20 pm **Too Young or Too Old, Discussion on Donor Age**
Elizabeth Pomfret, MD PhD, School of Medicine University of Colorado, Chief of Transplant Surgery, Aurora, CO, USA

3:40 pm **Live Video Question and Answer**

IMPACT Sessions

Lung: Heart
3:00 pm - 4:00 pm

Controversies in Candidate Selection for Cardiothoracic Transplantation

Moderators: Keith Wille, MD, Univ of Alabama at Birmingham, Professor of Medicine, Birmingham, AL, USA, Simon Urschel, MD, University of Alberta /Stollery Children's Hospital, Assoc Prof. Director Pediatric Cardiac Transplant, Edmonton, AB, Canada

3:00 pm **Frailty Assessment Tools and Risk Stratification in Cardiothoracic Transplant Candidates**
Palak Shah, MD, MS, Inova Heart and Vascular Institute, Director, Cardiovascular Genomics Center, Falls Church, VA, USA

3:10 pm **Marijuana Use and Cardiothoracic Transplant Candidacy - Current Views and Experiences**
Lorriana Leard, MD, University of California San Francisco, Professor of Clinical Medicine, San Francisco, CA, USA

3:20 pm **HIV or Viral Hepatitis Positive - A New Era in Potential Candidate Selection**
Christine Koval, MD, Cleveland Clinic Foundation, Associate Professor of Medicine, Section Head, Transplant Infectious Diseases, Cleveland, OH, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Heart: Kidney
3:00 pm - 4:00 pm

The Results of the Consensus Conference on Heart-Kidney Transplantation

Moderators: Darshana Dadhania, M.D., Weill Cornell Medicine - NYPH, Associate Professor of Medicine, New York, NY, USA, Allen Anderson, MD, FACC, FAHA, University of Texas Health San Antonio, Chief, Division of Cardiology, San Antonio, TX, USA

3:00 pm **The Pathophysiology of Cardiorenal Disease Leading to End Organ Failure**
W. H. Wilson Tang, MD, Cleveland Clinic, Professor, Cleveland, OH, USA

3:10 pm **A Prognostic Index for Combined Heart/ Kidney Transplantation- Which Biomarkers are Important? Review of Pertinent Studies**
Xingxing Cheng, MD MS, Stanford University, Clinical Assistant Professor, Palo Alto, CA, USA

3:20 pm **The Ethics of Fual Organ Transplantation: Evaluating Fairness in Organ Allocation**
Savitri Fedson, MD, Baylor College of Medicine- Michael E DeBakey VA Medical Center, MD, Houston, TX, USA

3:30 pm **Consensus Statements from the Heart/ Kidney Workgroup**
Jon Kobashigawa, MD, Cedars-Sinai Smidt Heart Institute, Director, Cedars-Sinai Heart Transplant Program, Los Angeles, CA, USA

3:40 pm **Live Video Question and Answer**

IMPACT Sessions

Ethics
3:00 pm - 4:00 pm

Reaching for the Elusive Brass Ring: Challenges Faced by Donor and Recipient Minorities when Accessing Transplant

Moderators: Paulo Martins, MD, PhD, University of Massachusetts, Worcester, MA, USA, Angie Nishio Lucar, MD, University of Virginia, Associate Professor, Charllotesville, VA, USA

3:00 pm **Using an Intersectionality Framework to Address Disparities in access to Kidney Transplantation**
Camilla Nonterah, PhD, University of Richmond, Assistant Professor of Health Psychology, Richmond, VA, USA

3:10 pm **Educational Outreach to Potential Recipients and Prospective Donors from Minority Groups**
Amy Waterman, PhD, UCLA, Transplant Research and Education Center, Professor in Residence, Deputy Director, Los Angeles, CA, USA

3:20 pm **Community-Engagement Approaches to Addressing Disparities in Transplantation**
Tanjala Purnell, PhD, MPH, Johns Hopkins University, Associate Director, Center for Health Equity, Baltimore, MD, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Translational
3:00 pm - 4:00 pm

Regulatory T cell therapy for Clinical Autoimmune and Transplantation Tolerance

Moderators: James Mathew, PhD, Northwestern University, Professor, Chicago, IL, USA, Giovanna Lombardi, BSc, PhD, FMedSci, King's College, Professor of Human Transplant Immunology, London, United Kingdom

3:00 pm **CAR Tregs**
Megan Levings, PhD, BC Children's Hospital Research Institute, Vancouver, BC, Canada

3:10 pm **Regulatory T cells Therapies Being Conducted at UCSF**
Qizhi Tang, PhD, UCSF, Professor, San Francisco, CA, USA

3:20 pm **Regulatory T cells Studies Being Undertaken in the UK**
Alberto Sanchez-Fueyo, King's College, London, England

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

ID
3:00 pm - 4:00 pm

Don't Give up HOPE: Evolving Standard Transplant Care for HIV Infected Patients

Moderators: Emily Blumberg, MD, FAST, Hospital of the University of Penn, Perelman School of Medicine at the University of Pennsylvania, Professor of Medicine, Director, Transplant Infectious Diseases, Philadelphia, PA, USA, Ghady Haidar, MD, University of Pittsburgh Medical Center, Assistant Professor of Medicine, Pittsburgh, PA, USA

3:00 pm **HIV+/+ Kidney Transplantation: Time to Expand**
Dong Heun Lee, MD, University of California San Francisco, Associate Professor, San Francisco, CA, USA

3:10 pm **HIV+/+ Heart and Lung Transplantation: Novel Strategies for a Hopeful World**
Marcus Pereira, MD, MPH, New York Presbyterian Hospital, New York, NY, USA

3:20 pm **HIV+/+ Liver Transplantation: Who, Why, When, Where to Refer**
Meenakshi Rana, MD, Icahn School of Medicine at Mount Sinai, Associate Professor of Medicine, Division of Infectious Disease, New York, NY, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Pharmacy
3:00 pm - 4:00 pm

Advanced Ambulatory Practice Models in Solid Organ Transplant

Moderators: Christina Doligalski, PharmD, UNC Hospitals and Clinics, Clinical Pharmacist Practitioner, Chapel Hill, NC, USA, Nicole McCormick, DNP, MBA, NP-C, CCTC, University of Colorado, Assistant Professor, Denver, CO, USA

3:00 pm **Development of an Advanced Practice Pharmacist Clinic for Outpatient Transplant Recipients**
Holli Winters, PharmD, BCPS, Ohio State University Wexner Medical Center, Clinical Pharmacy Specialist, Columbus, OH, USA

3:10 pm **Learning the Value of Pharmacy Learners in Transplant**
Matt Harris, PharmD, Duke, Director Transplant Pharmacy Programs, Durham, NC, USA

3:20 pm **Use of Pharmacy Technicians in the Outpatient Transplant Clinic**
Kristen Belfield, PharmD, BCPS, Yale New Haven Hospital, Clinical Pharmacy Specialist, Solid Organ Transplant, New Haven, CT, USA

3:30 pm **Role Delineations in a Multi-Disciplinary Outpatient Transplant Clinic**
Kristen Ryland, BS BSN MSN NP, Mayo Clinic

3:40 pm **Live Video Question and Answer**

Sponsor Networking

4:00 pm - 4:30 pm

This symposium is not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Natera - Renasight: Changing the Landscape of Renal Genetic Testing

Rapid Fire Oral Abstracts

Basic
4:30 pm - 5:30 pm

Biomarkers, Immune Assessment and Clinical Outcomes - II

Moderators: John Friedewald, MD, FAST, Northwestern University, Professor, Chicago, IL, USA, Sunil Kurian, MD, Scripps Health, Research Scientist, La Jolla, CA, USA

4:30 pm **Development and Validation of a Novel Peripheral Blood Based Gene Signature for Acute Rejection Following Renal Transplantation**
D. Zhang, Y. Wang, X. Hu, *Department of Urology, Beijing Chao-Yang Hospital, Capital Medical University, Beijing, China*

4:35 pm **Multiplexed Imaging Mass Cytometry of the Alloimmune Landscape of Rejection in Clinical Liver Transplantation**
J. Emamaullee, N. Ung, C. Man, J. Hoeflich, C. Goldbeck, A. Barbetta, R. Sun, N. Matasci, J. Katz, J. Lee, S. Chopra, L. Sher, S. Asgharzadeh, O. Akbari, Y. Genyk, *University of Southern California, Los Angeles, CA*

4:40 pm **Hypothermic Oxygenated Machine Perfusion Protects Against Cholangiocyte and Hepatocyte Injury and Mitigates Inflammation vs Static Cold Storage: Preliminary Results from a Single Center**
G. Panayotova, F. Paterno, M. McCarty, G. Dikdan, S. Simonishvili, Y. Qin, L. Brown, A. Amin, K. E. Lunsford, J. V. Guarrera, *Transplant Surgery, Rutgers NJMS, Newark, NJ*

4:45 pm **The Effect of the Affordable Care Act on Insurance Status, Waitlist, and Transplant Outcomes in Liver Transplantation**
B. I. Shaw[1], M. L. Samoylova[1], V. Wang[2], T. Risoli Jr[3], S. Peskoe[3], K. Caddell[3], L. M. McElroy[1], *[1]Surgery, Duke University, Durham, NC, [2]Population Health Sciences, Duke University, Durham, NC, [3]Biostatistics, Duke University, Durham, NC*

4:50 pm **Gain of Function Mutations in Latent Membrane Protein 1 of Epstein Barr Virus are Associated with Increased Risk of Post-Transplant Lymphoproliferative Disorder**
O. M. Martinez[1], S. M. Krams[1], M. Robien[2], M. Lapasaran[1], M. Arvedson[1], K. Weinberg[1], S. Boyd[1], B. Armstrong[3], C. Twist[4], D. Gratzinger[1], B. Tan[1], A. Trickey[1], M. Sever[3], M. Brown[2], D. Bernstein[1], C. O. Esquivel[1], *[1]Stanford University Sch of Med, Stanford, CA, [2]NIAID, Rockville, MD, [3]Rho, Durham, NC, [4]Roswell Park, Buffalo, NY*

4:55 pm **Clinical and Molecular Profiling Can Help in Predicting the Response to Alemtuzumab Treatment in Kidney Transplant Recipients with Severe or Glucocorticoid-Resistant Acute Rejection**
D. M. Peelen[1], M. van der Zwan[1], M. C. Clahsen-van Groningen[2], D. A. Mustafa[2], C. C. Baan[1], D. A. Hesselink[1], *[1]Internal Medicine - Nephrology & Transplantation, Erasmus MC, Rotterdam, Netherlands, [2]Pathology, Erasmus MC, Rotterdam, Netherlands*

5:00 pm **Identification of Distinct Blood Monocyte Phenotypes from Transplant Kidney Recipients Undergoing Cellular (TCMR) and Mixed Antibody Mediated Rejection (ABMR)**
C. Macedo, E. Bailly, K. Louis, M. Lucas, A. Zeevi, P. Randhawa, D. Metes, *Starzl Transplantation Institute, Pittsburgh, PA*

5:05 pm **Validation of a Novel Gene Expression Biomarker of Rejection Following Liver Transplantation**
J. Levitsky[1], M. Kandpal[1], T. Whisenant[2], K. Guo[1], S. Kurian[3], M. Abecassis[4], *[1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]University of California San Diego, San Diego, CA, [3]Scripps Clinic, La Jolla, CA, [4]University of Arizona College of Medicine Tucson, Tucson, AZ*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

ID
4:30 pm - 5:30 pm

COVID-19 Session 2
Moderators: Alfred Luk, M.D., Tulane University, Assistant Professor of Medicine, New Orleans, LA, USA, Rachel Miller, MD, Duke University, Professor of Medicine, Durham, NC, USA

4:30 pm **COVID-19 Potential Donor Derived Transmission Events Investigations: Early DTAC Experience**
R. La Hoz, A. Agarwal, S. Aslam, K. Dunn, J. Goldman, D. Levine, C. Marboe, G. F. Marklin, S. M. Pouch, M. Rana, R. Razonable, H. L. Stevenson, H. Te, A. E. Woolley, M. Michaels, L. Danziger-Isakov, *OPTN DTAC, Richmond, VA*

4:35 pm **The Impact of Covid-19 Pandemic on Living Donor Liver and Renal Transplantations in Japan: A Nationwide Survey**
S. Yamanaga[1], T. Hibi[2], R. Osawa[3], K. Yuzawa[4], H. Egawa[5], K. Kuramitsu[6], *[1]General Surgery, Japanese Red Cross Kumamoto Hospital, Kumamoto, Japan, [2]Pediatric Surgery and Transplantation, Kumamoto University, Kumamoto, Japan, [3]Infectious disease, Kameda medical center, Kamogawa, Japan, [4]Transplant Surgery, Mito Medical Center, Higashiibaraki District, Japan, [5]Gastrointestinal Surgery, Tokyo Women's Medical University Hospital, Shinjyuku-ku, Japan, [6]HBP surgery, Kobe University, Kobe, Japan*

4:40 pm **T-Cell Responses in Solid Organ Transplant Recipients with SARS-CoV-2 Infection**
V. H. Ferreira, T. M. Marinelli, T. Ku, M. Ierullo, B. Majchrzak-Kita, I. Bahinskaya, N. Pinzon, A. Humar, D. Kumar, *University Health Network, Toronto, ON, Canada*

4:45 pm **Mortality, Risk Factors, and Treatment of Covid-19 Infection in Solid Organ Transplants: A Systematic Review and Meta-analysis**
S. Yin, T. Song, Q. Zhong, T. Lin, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

4:50 pm **Propensity Matched Analysis of Death and Non-favorable Discharge Among Hospitalized Transplant Recipients with COVID-19**
J. T. Swan[1], E. Rizk[2], S. L. Jones[1], N. Nwana[1], J. C. Nicolas[1], A. Tran[1], T. Nisar[1], T. Menser[1], S. G. Yi[2], L. W. Moore[1], A. O. Gaber[2], R. J. Knight[2], *[1]Houston Methodist Research Institute, Houston, TX, [2]Houston Methodist Hospital, Houston, TX*

4:55 pm **Covid-19 Related Deaths Across the U.S. in Kidney Transplant Recipients**
K. Goli, N. T. Galvan, R. Cotton, J. A. Goss, C. A. O'Mahony, A. Rana, *Department of Abdominal Transplantation, Baylor College of Medicine, Houston, TX*

5:00 pm **Impact of COVID-19 on Solid Organ Transplantation**
E. Sampson[1], S. Hall[2], K. Robichaux[3], A. Kumar[2], N. Kemmer[4], J. Buggs[5], *[1]Lake Erie College of Osteopathic Medicine, Tampa, FL, [2]Morsani College of Medicine, University of South Florida, Tampa, FL, [3]Honors College, University of South Florida, Tampa, FL, [4]Transplant Hepatology, Tampa General Hospital, Tampa, FL, [5]Transplant Surgery, Tampa General Hospital, Tampa, FL*

5:05 pm **Covid-19 in Solid Organ Transplantation (SOT): Results of the National Covid Cohort Collaborative (N3C)**
G. Agarwal[1], A. Vinson[2], R. Dai[3], E. French[4], S. Lee[5], A. Olex[4], A. Anzalone[6], V. Madhira[7], R. B. Mannon[8], *[1]Medicine, University of Alabama at Birmingham, Birmingham, AL, [2]Medicine/Nephrology, Nova Scotia Health Authority, Halifax, NS, Canada, [3]Biostatistics, University of Nebraska Medical Center, Omaha, NE, [4]Wright Center for Clinical and Translational Research, VIrginia Commonwealth University, Richmond, VA, [5]Medicine/Infectious Disease, University of Saskatchewan, Saskatoon, SK, Canada, [6]Neurology, University of Nebraska Medical Center, Omaha, NE, [7]Palia Software, Not sure, OR, [8]Medicine/Nephrology, University of Nebraska Medical Center, Omaha, NE*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Heart
4:30 pm - 5:30 pm

Do's and Don'ts of Heart Transplant Care
Moderators: Sean Pinney, MD, University of Chicago, Director, Advanced Heart Failure & Transplantation, Chicago, IL, USA, Palak Shah, MD, MS, Inova Heart and Vascular Institute, Director, Cardiovascular Genomics Center, Falls Church, VA, USA

4:30 pm **Pregnancy Outcomes in 108 Heart Transplant Recipients**
L. A. Coscia[1], A. Yusuf[1], S. Rao[2], S. Constantinescu[3], M. J. Moritz[4], *[1]Transplant Pregnancy Registry International, Philadelphia, PA, [2]University of Virginia Heath System, Charlottesville, VA, [3]Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [4]Surgery, Lehigh Valley Health Network, Allentown, PA*

4:35 pm **DSA is Associated with Molecular Changes in Many Hearts with Minor Abnormalities but Not Diagnosed as Antibody-Mediated Rejection**
P. Halloran[1], K. S. Madill-Thomsen[1], &. the INTERHEART Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

4:40 pm **Quilty Lesions are Associated with a Tolerance Profile in Heart Allografts Biopsies**
J. Torrealba, S. Moore, S. Sathirareuangchai, L. De Las Casas, Q. Cai, *Pathology, UTSW Medical Ctr, Dallas, TX*

4:45 pm **The Pathology of Heart Allograft Biopsies: Discrepancies in Interpretation Between Conventional Histology and the Molecular Microscope Diagnostic (MMDx®) System**
P. Randhawa[1], A. Seitz[2], Y. Huang[1], B. Feingold[2], *[1]Department of Pathology, Pittsburgh, PA, [2]Pediatrics, University of Pittsburgh, Pittsburgh, PA*

4:50 pm **Impact of Statin Intensity on the Incidence of Vascular Events and Graft Survival in Heart Transplant Recipients**
E. Kim[1], I. Booth[2], R. Madathil[3], B. Ravichandran[1], M. Demehin[2], M. Plazak[2], *[1]University of Maryland School of Pharmacy, Baltimore, MD, [2]Pharmacy, University of Maryland Medical Center, Baltimore, MD, [3]University of Maryland School of Medicine, Baltimore, MD*

4:55 pm **Assessing the Impact of Acute Major Adverse Kidney Events on Clinical Outcomes in Heart Transplant Recipients**
J. E. Kelly[1], C. Perez[1], D. Taber[1], R. J. Tedford[2], B. McMahon[2], S. Alzaidi[1], H. B. Meadows[1], *[1]Pharmacy, MUSC Health, Charleston, SC, [2]Medicine, MUSC Health, Charleston, SC*

5:00 pm **Acute Kidney Injury Requiring Dialysis in Heart Transplant Recipients is a Risk Factor for Graft Failure and Overall Mortality**
M. A. Merzkani, H. Murad, A. Pottebaum, A. Java, A. Malone, J. Schilling, A. Itoh, R. Delos Santos, T. Alhamad, *Transplant, Washington University, Saint Louis, MO*

5:05 pm **Acute Dialysis, Mortality and Renal Failure After Heart Alone Transplant by Egfr and Dialysis Requirement in the United States**
M. Aljuhani[1], T. Alexy[1], S. Jackson[2], C. Martin[1], R. Kandaswamy[3], S. Riad[1], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Complex Care Analytics, Fairview Health Services, Minneapolis, MN, [3]Surgery, University of Minnesota, Minneapolis, MN*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Liver
4:30 pm - 5:30 pm

Hemodynamic Consequences of Portal Hypertension Including Kidney Issues

Moderators: Catherine Frenette, MD, FAST, AGAF, FAASLD, Scripps Clinic Department of Organ Transplant, Medical Director of Liver Transplant, La Jolla, CA, USA, Keri Lunsford, MD, PhD, Rutgers New Jersey Medical Schoo, Assistant Professor of Surgery, Newark, NJ, USA

4:30 pm **The Rate of Hospitalization Among Patients with Cirrhosis is More Than Twice as High as Patients Over 85 Years**
N. R. Mazumder[1], K. Guo[2], L. Zhao[3], A. Kho[1], K. Walters[4], T. S. Carey[4], C. Loftus[1], D. P. Ladner[1], *[1]Northwestern Memorial Hospital, Chicago, IL, [2]Biostatistics, Northwestern Memorial Hospital, Chicago, IL, [3]Biostatistcs, Northwestern Memorial Hospital, Chicago, IL, [4]University of North Carolina Chapel Hill, Chapel Hill, NC*

4:35 pm **A Novel Liver Assist Device as a Bridge to Liver Transplantation in Acute on Chronic Liver Failure Patients with Multi-Organ Failure**
S. Ahmad[1], I. W. Liou[1], J. Reyes[2], R. Bakthavatsalam[3], N. C. Smith[4], R. L. Carithers[1], C. Martin[1], D. Gao[5], *[1]Medicine, University of Washington, Seattle, WA, [2]Surgery, University of Washington, SEATTLE, WA, [3]Surgery, University of Washington, Seattle, WA, [4]Nursing, University of Washington, Seattle, WA, [5]Engineering, University of Washington, Seattle, WA*

4:40 pm **Rabbit Anti-thymocyte Globulin Induction is Not Associated with Improved Outcomes in Liver Transplant Recipients**
P. Nguyen, N. Wilson, G. Saracino, R. Patel, S. K. Asrani, G. Testa, T. Sam, *Baylor University Medical Center, Dallas, TX*

4:45 pm **Effects of Timing of Everolimus Transition on Renal Outcomes in Liver Transplant Recipients**
M. Leick[1], H. Belleau[2], T. McCashland[3], *[1]Nebraska Medicine, Omaha, NE, [2]Bryan Health, Lincoln, NE, [3]University of Nebraska Medical Center, Omaha, NE*

4:50 pm **Machine Perfusion of Kidney Grafts in Simultaneous Liver Kidney Transplantation: National Trends and Outcomes**
A. Chang[1], M. Chen[1], P. Abt[1], T. Bittermann[2], *[1]Surgery, University of Pennsylvania, Philadelphia, PA, [2]Gastroenterology, University of Pennsylvania, Philadelphia, PA*

4:55 pm **Outcomes of Transjugular Intrahepatic Portosystemic Shunts (TIPS) in Dialysis-Dependent ESLD Patients: The ALTA Study**
J. Ge[1], J. Boike[2], M. German[3], G. J. Morelli[4], E. Spengler[3], A. Said[3], A. S. Lee[3], A. Hristov[3], A. Desai[5], T. Couri[6], S. Paul[6], C. Frenette[7], N. Christian-Miller[7], M. Laurito[8], E. Verna[8], U. Rahim[9], A. Goel[9], D. Gregory[2], L. VanWagner[2], K. P. Kolli[1], J. Lai[1], *[1]University of California, San Francisco, San Francisco, CA, [2]Northwestern Memorial Hospital, Chicago, IL, [3]University of Wisconsin, Madison, WI, [4]University of Florida Health, Gainsville, FL, [5]Indiana University School of Medicine, Indianapolis, IN, [6]University of Chicago, Chicago, IL, [7]The Scripps Clinic, La Jolla, CA, [8]Columbia University, New York, NY, [9]Stanford University, Stanford, CA*

5:00 pm **Home-based Liver Frailty Intervention (lift) in Liver Transplant Candidates: A Pilot Study**
A. J. Thuluvath[1], K. Belfanti[1], S. Morrissey[1], O. Siddiqui[1], J. Peipert[1], A. Daud[1], J. Levitsky[1], T. Bogg[2], A. Flores[1], D. P. Ladner[1], *[1]Northwestern University Transplant Research Collaborative, Chicago, IL, [2]Department of Psychology, Wayne State University, Detroit, MI*

Rapid Fire Oral Abstracts

Lung
6:00 pm - 7:00 pm

When Opportunity Knocks... Identifying Interventions to Optimize Lung Transplant Outcomes

Moderators: Hilary Goldberg, MD, MPH, -Brigham and Women's Hospital, Clinical Director, Pulmonary and Critical Care Medicine, Needham, MA, USA, Matthew Hartwig, MD, Duke University, Durham, NC, USA

6:00 pm **Pregnancy Outcomes in 39 Lung Transplant Recipients**
S. Constantinescu[1], L. A. Coscia[2], A. Yusuf[2], S. Rao[3], M. J. Moritz[4], *[1]Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [2]Transplant Pregnancy Registry International, Philadelphia, PA, [3]University of Virginia Heath System, Charlottesville, VA, [4]Lehigh Valley Health Network, Allentown, PA*

6:05 pm **Guiding Therapeutic Plasma Exchange for Amr Treatment in Lung Transplant Recipients Using Serial Dilution in Single Antigen Bead Assay**
O. A. Timofeeva[1], J. Choe[2], M. Alsammak[2], E. J. Yoon[2], S. Geier[2], K. Carney[2], J. Au[2], A. Diamond[2], J. A. Galli[2], K. Shenoy[2], A. Mamary[2], S. Seghal[2], P. Mullhal[2], Y. Toyoda[2], N. Shigemura[2], F. Cordova[2], G. Criner[2], J. Brown[2], *[1]MedStar Georgetown University Hospital, Washington, DC, [2]Temple University Hospital, Philadelphia, PA*

6:10 pm **Renal Preservation with Belatacept-Based versus Everolimus-Based Immunosuppression in Lung Transplant Recipients**
E. Sartain[1], K. Schoeppler[1], B. Crowther[1], J. Smith[2], A. Gray[2], *[1]University of Colorado Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, CO, [2]Department of Medicine, Division of Pulmonary Sciences and Critical Care, University of Colorado, Denver, CO*

6:15 pm **Elexacaftor/ivacaftor/tezacaftor in Lung Transplant Recipients: A Case Series**
L. M. Potter[1], B. Vargas[2], S. M. Rotolo[1], C. McEwen[1], K. Tsui[1], *[1]University of Chicago Medicine, Chicago, IL, [2]Roosevelt University, Chicago, IL*

6:20 pm **Use of Granulocyte Colony Stimulating Factor After Lung Transplantation is Not Associated with Increased Likelihood of Acute Cellular Rejection**
S. Fredrick[1], C. Iasella[2], L. Sacha[3], R. Rivosecchi[3], M. Morrell[3], P. Sanchez[3], J. Pilewski[3], M. Snyder[3], J. McDyer[3], C. Moore[3], *[1]University of Rochester Medical Center, Rochester, NY, [2]University of Pittsburgh School of Pharmacy, Pittsburgh, PA, [3]University of Pittsburgh Medical Center, Pittsburgh, PA*

6:25 pm **Impact Analysis of Virtual Transplant Ambulatory Pharmacist During Covid-19**
L. Park, G. Waldman, J. Kim, C. Rogers, J. Clark, *Massachusetts General Hospital, Boston, MA*

6:30 pm **Outcomes of IVIG Monotherapy for Donor-Specific Antibodies After Lung Transplantation**
K. Spence, S. Heeney, M. Morrison, S. A. Rega, F. D. Irene, K. B. Harrison, C. M. Shaver, *Vanderbilt University Medical Center, Nashville, TN*

6:35 pm **Liver Dysfunction Following Lung Transplantation**
E. J. Hyzny[1], E. G. Chan[1], J. P. Ryan[1], T. Harano[1], M. R. Morrell[2], P. G. Sanchez[1], *[1]Cardiothoracic Surgery, University of Pittsburgh School of Medicine, Pittsburgh, PA, [2]Pulmonary, Allergy and Critical Care Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA*

6:40 pm **Live Video Question and Answer**

Poster Video Chat

Public Policy & Ethics
7:30 pm - 8:30 pm

Adherence, Economics, and Ethics

7:30 pm **Early Outcome of Heart-Kidney Transplantation in the Current Heart Allocation System in the United States**
S. Rao[1], A. Doyle[1], D. Brennan[2], S. Constantinescu[3], *[1]University of Virginia, Charlottesville, VA, [2]Johns Hopkins Medical Institute, Baltimore, MD, [3]Lewis Katz School of Medicine at Temple University, Philadelphia, PA*

7:40 pm **Liver Simulated Allocation Model Does Not Accurately Predict Organ Offer Decisions in Pediatric Liver Transplant Candidates**
N. L. Wood[1], D. B. Mogul[2], E. K. Hsu[3], E. R. Perito[4], G. V. Mazariegos[5], D. Vanderwerken[1], D. L. Segev[2], S. Gentry[1], *[1]US Naval Academy, Annapolis, MD, [2]Johns Hopkins, Baltimore, MD, [3]Univ of Washington, Seattle, WA, [4]UCSF, San Francisco, CA, [5]Univ of Pittsburgh, Pittsburgh, PA*

7:50 pm **Impact of Covid-19 in Transplant Care: Attitudes, Feeling and Behaviors of Liver, and Kidney Pre and Post Transplant Patients**
J. Ramos-Ayes, *Beth Israel Deaconess Medical Center, Boston, MA*

8:00 pm **Influence of Frailty on Psychometric Factors and Health-related Quality of Life in Patients on the Waitlist for Liver Transplantation**
C. G. Klein, J. Latuske, E. Malamutmann, A. Paul, A. Oezcelik, *University Medicine Essen, Essen, Germany*

8:10 pm **Psychosocial Factors Influencing Patients' Decision Making About Upper Extremity Vca**
B. Kuramitsu[1], J. Gacki-Smith[1], A. Ferzola[2], K. Vanterpool[2], C. Kunkle[3], M. Hewitt[3], A. Schultheis[3], T. Riggleman[3], J. Taylor[3], C. Cooney[2], M. Levan[2], S. Tintle[3], G. Brandacher[2], E. Gordon[1], *[1]Northwestern University, Chicago, IL, [2]Johns Hopkins University, Baltimore, MD, [3]Walter Reed National Military Medical Center, Bethesda, MD*

IMPACT Sessions
Kidney
9:00 am - 11:00 am

How Best to Optimize Deceased Donor Kidneys for Organ Transplantation in 2021?
Moderators: Sundaram Hariharan, MD, Starzl Transplant Institute, Univ of Pittsburgh Med Center, Professor of Medicine and Surgery, Pittsburgh, PA, USA

9:00 am **Use of AKI Kidneys from Deceased Donors for Kidney Transplantation**
Raymond Heilman, MD, Mayo Clinic, Expanding the Utilization of Kidneys from Donors with Acute, Phoenix, AZ, USA

9:10 am **Can we Utilize Some of the Organs that are Being Discarded in USA?**
Sumit Mohan, MD, MPH, Columbia University Medical Center, New York, NY, USA

9:20 am **Optimizing Kidney Transplant Outcome with High KDPI Kidneys**
Michele Molinari, MD, MSc, FACS, Michele Molinari, Associate Professor, University of Pittsburgh Medical Center, Associate Professor, pittsburgh, PA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Kidney
9:00 am - 10:00 am

APOL1 and Living Donation: Donors and Recipients
Moderators: Caroline Jadlowiec, MD, Mayo Clinic Arizona, Dr., Phoenix, AZ, USA, Nadeen Khoury, MD, Henry Ford Transplant Institute, Transplant Nephrologist, Detroit, MI, USA

9:00 am **APOL1 and Transplant Recipient Outcomes**
Amber Reeves-Daniel, DO, Wake Forest School of Medicine, Associate Professor, Winston Salem, NC, USA

9:10 am **APOL1, Potential Donors, and Living Donation**
Mona Doshi, MBBS, University of Michigan, Professor, Ann Arbor, MI, USA

9:20 am **APOL1, Hypertension and Chronic Kidney Disease, Ethics of Genetic Testing and Psychosocial Implications**
John Friedewald, MD, FAST, Northwestern University, Professor of Medicine & Surgery, Chicago, IL, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Liver
9:00 am - 10:00 am

Above and Below the Diaphragm: Pulmonary Vascular Disease and Liver Transplantation
Moderators: Keith Wille, MD, Univ of Alabama at Birmingham, Professor of Medicine, Birmingham, AL, USA, Lindsay King, MD, MPH, Duke, Assistant Professor of Medicine, Durham, NC, USA

9:00 am **Diagnostic Strategies for the Evaluation of Pulmonary Vascular Disease in Chronic Liver Disease**
Deborah Levine, MD, University of Texas Health, Medical Director of Lung Transplantation/Director of Pulmonary Hypertension, San Antonio, TX, USA

9:10 am **Outcomes of Liver Transplantation for Hepatopulmonary Syndrome - Should Transplantation be Performed in Patients with Severe Hypoxemia?**
Michael Fallon, MD, FACP, AGAF, FAASLD, UArizona College of Medicine-Phoenix, Professor of Medicine and Chair Department of Medicine, Phoenix, AZ, USA

9:20 am **Management of Portopulmonary Hypertension Pre and Post Liver Transplantation**
Michael Krowka, MD, Mayo Clinic, Professor of medicine, Rochester, MN, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

VCA
9:00 am - 10:00 am

Novel Strategies to Modulate Innate and Adaptive Immunity in VCA

Moderators: Bruce Gelb, M.D., NYU Langone Medical Center, Medical Director, VCA Transplant Program, New York, NY, USA, Sue McDiarmid, MD, UCLA Medical Center, Professor of Pediatrics and Surgery, Pacific Palisades, CA, USA

9:00 am **The Science of Immunosupression in VCA**
Stefan Tullius, MD, PhD, Brigham & Women's Hospital, Chief, Division of Transplant Surgery, Boston, MA, USA

9:10 am **Novel Insights into Mechanisms of Ischemia Reperfusion Injury in VCA**
Jerzy Kupiec-Weglinski, MD, PhD, UCLA Medical Center, PROFESSOR OF SURGERY, Los Angeles, CA, USA

9:20 am **Immunological Opportunities and Hurdles for Tolerance Induction in VCA**
Wayne Hancock, MD PhD, Childrens Hospital of Philadelphia, Professor of Pathology and Laboratory Medicine, Philadelphia, PA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pediatric
9:00 am - 10:00 am

Walking the Tightrope: Malignancies after Pediatric Solid Organ Transplantation (SOT)

Moderators: Vikas Dharnidharka, MD, MPH, Washington University in St. Louis, Professor and Vice-Chair, Pediatrics, St. Louis, MO, USA, Nicole Hayde, MD, MS, Montefiore Medical Center, Medical Director, Pediatric Kidney Transplantation, Bronx, NY, USA

9:00 am **Graft Outcomes Following Malignancies in Pediatric SOT**
Lars Pape, M.D., PhD, University Hospital of Essen, Prof. Dr. med., Essen, Germany

9:10 am **Where are We At: Current Status of Malignancies after Pediatric Solid Organ Transplantation**
Rahul Chanchlani, MD, McMaster University, Hamilton, Ontario, Canada

9:20 am **Prevention Strategies, Including the One Vaccine That Can Prevent Cancer: HPV Vaccine**
Corina Nailescu, MD, Riley Hospital for Children, Associate Professor of Clinical Pediatrics, Indianapolis, IN, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Basic
9:00 am - 10:00 am

Novel Approaches for Immune Modulation of the CD154 Pathway in Transplantation: New Tricks for an Old Dog

Moderators: Christian Larsen, MD, PhD, Emory University, Co_Director Emory Transplant Center, Atlanta, GA, USA, Marilia Cascalho, MD PhD, University of Michigan, Associate Professor, Ann Arbor, MI, USA

9:00 am **Costimulation Blockade Promote Donor-specific B cells Differentiation into Suppressors of B cell Responses**
Anita Chong, PhD, The University of Chicago Medicine, Professor, Chicago, IL, USA

9:10 am **CD11b is a Novel Alternate Receptor for CD154 during Alloimmunity**
Mandy Ford, PhD, Emory University, Professor, Atlanta, GA, USA

9:20 am **Anti-CD40 in Combination with Apoptotic Donor Cells to Promote Islet Allograft Tolerance**
Xunrong Luo, MD,PhD, Duke University School of Medicine, Professor of Medicine, Durham, NC, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Translational
9:00 am - 10:00 am

Taking the Next Step in Organ Perfusion: From Preservation to Personalized Repair

Moderators: Korkut Uygun, PhD, Massachusetts General Hospital, Assoc Prof Surgery, Boston, MA, USA, Andrew Barbas, MD, Duke University, Assistant Professor of Surgery, Division of Abdominal Transplant, Durham, NC, USA

9:00 am **Clinical Trial Design for Marginal Organ Utilization after Pre-transplant Repair**
Peter Friend, MD, University of Oxford, Professor of Transplantation, Oxford, United Kingdom

9:10 am **Pre-transplant Therapies During Organ Perfusion: The State of the Art**
Gregory Tietjen, PhD, Yale University School of Medicine, Assistant Professor, New Haven, CT, USA

9:20 am **Where Should Pre-transplant Organ Repair Happen? The Pros and Cons of Centers-of-Care Versus Recipient Centers**
Shaf Keshavjee, MD, Toronto General Hospital, Toronto, ON, Canada

9:30 am **Live Video Question and Answer**

IMPACT Sessions

ID
9:00 am - 10:00 am

Population Health Improves Transplant Outcomes

Moderators: Lilian Abbo, MD, University Of Miami Miller School of Medicine, Professor of Clinical Infectious Diseases, Miami, FL, USA, Cameron Wolfe, MBBS, MPH, Duke University Medical Center, Associate Professor of Medicine, Durham, NC, USA

9:10 am **Antimicrobials as Precision Medicine: Opportunities for Individualized Care**
Graeme Forrest, MBBS, Rush University medical Center, Professor of Medicine, Chicago, IL, USA

9:00 am **Improving Patient Outcomes Together: Engaging in Stewardship Across Disciplines**
Margaret Jorgenson, UW Health, Madison, WI, USA

9:20 am **Standardizing Infection Prevention and Control Strategies: Where is the Evidence?**
Elena Beam, M.D, Mayo Clinic College of Medicine, Assistant Professor, Rochester, MN, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pharmacy: Liver
9:00 am - 10:00 am

Help Me Stay Sober After Liver Transplantation – Multimodal Multidisciplinary Approach

Moderators: Sheila Jowsey-Gregoire, MD, Mayo Clinic, Shirley Tsunoda, PharmD, University of California San Diego, San Diego, CA, USA

9:00 am **Staying Sober: Pre-Transplant Assessment and Post-Transplant Monitoring**
Vinay Sundaram, MD, Cedars Sinai, Director, Hepatology Outcomes Research, Los Angeles, CA, USA

9:10 am **Multidisciplinary Approaches to Achieve Success in Maintaining Patient Sobriety Post-Liver Transplantation**
Gerald Scott Winder, MD MSc, University of Michigan, Clinical Associate Professor, Ann Arbor, MI, USA

9:20 am **Therapeutic Strategies for Treating Alcohol Relapse Post-Transplantation**
Jeong Park, MS, PharmD, University of Michigan, Clinical Professor, Ann Arbor, MI, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

APP
9:00 am - 10:00 am

Pathway to Publishing
Moderators: Karen Kerepesi, PA-C, MPAS, Cleveland Clinic, Cleveland, OH, USA

9:00 am **Recognizing Clinical Opportunities for Translational Research and Initial Steps**
Annette Needham, DNP, NP-C, CCTC, UC Davis Transplant Center, Transplant Quality Manager, Sacramento, CA, USA

9:10 am **Implementing Fundamental Steps in the Research Process**
Haley Hoy, PhD, NP, University of Alabama Huntsville/Vanderbilt Medical Center, Nurse Practitioner, Huntsville, AL, USA

9:20 am **Pearls for the Clinician in Addressing Common Barriers to Research**
Stacee Lerret, PhD, CPNP-AC/PC, CCTC, FAAN, Medical College of Wisconsin, Associate Professor, Milwaukee, WI, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Ethics
9:00 am - 10:00 am

Incorporating New Data into Selection of Living Kidney Donors: Minor Modifications or Fundamental Changes?
Moderators: Kenneth Newell, MD, PhD, Emory University School of Medicine, Professor of Surgery and Vice Chair for Faculty Affairs, Atlanta, GA, USA, Emilio Poggio, MD, Cleveland Clinic, MD, Cleveland, OH, USA

9:00 am **Review the Old and New Outcome Data Underlying the Classic and New Paradigms for Selection of Living Kidney Donors**
Vineeta Kumar, M.D., University of Alabama at Birmingham, Professor of Medicine, Endowded Professor in Transplant Nephrology, Birmingham, AL, USA

9:10 am **Time for a Change: Unacceptable Candidates of the Past may be Acceptable; It's Time to Redefine Acceptable Candidates for Living Kidney Donation**
Robert Steiner, MD, UCSD Medical Center, Transplant Nephrology, San Diego, CA, USA

9:20 am **Old is Gold: The Classic Selection Paradigm was "Almost Right" and will Continue to Serve us well, Perhaps with Minor Modifications**
Arthur Matas, MD, University of Minnesota Medical School, Professor of Surgery, Minneapolis, MN, USA

9:30 am **Live Video Question and Answer**

Plenary Session 3
10:30 am - 11:30 am
Moderators: A. Osama Gaber, MD, Houston Methodist Hospital, Houston, TX, USA, John Gill, MD, MS, University of British Columbia, Professor of Medicine, Vancouver, BC, Canada

10:30 am **Overall Survival by Best Overall Response with Tabelecleucel in Patients with Epstein-Barr Virus-Driven Post-Transplant Lymphoproliferative Disease After Solid Organ Transplant**
S. Prockop[1], L. Gamelin[2], R. Dinavahi[2], Y. Sun[2], N. Guzman-Becerra[2], H. Parmar[2], [1]Memorial Sloan Kettering Cancer Center, New York, NY, USA, [2]Atara Biotherapeutics, South San Francisco, CA, USA

10:40 am **TIGIT Agonism Improves Immunosuppression of Cd8 T Cells by Ctla-4ig in a Treg Dependent Manner**
C. R. Hartigan, D. Liu, M. L. Ford, Emory University Transplant Center, Emory University, Atlanta, GA, USA

10:50 am **Donor-derived Cell-free DNA Distinguishes Acute Rejection from Other Causes of Graft Injury in Liver Transplant Recipients**
J. Levitsky[1], M. Miller[2], R. Sinha[2], E. Bixler[2], A. Al-Turck[2], J. Weems[2], M. Altrich[2], S. Kleiboeker[2], M. Abecassis[3], [1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, USA, [2]Viracor Eurofins, Lees Summit, MO, USA, [3]University of Arizona College of Medicine Tucson, Tucson, AZ, USA

11:00 am **Measuring the Impact of Targeting FcRn-Mediated IgG Recycling on Donor-Specific Alloantibodies in a Sensitized NHP Model**
M. Manook[1], W. Flores[2], R. Schmitz[1], Z. Fitch[1], J. Yoon[1], Y. Bae[1], B. I. Shaw[1], M. Harnois[3], S. Permar[3], A. Kirk[1], D. Magnani[2], J. Kwun[1], S. Knechtle[1], [1]Duke Transplant Center, Duke University Medical Center, Durham, NC, USA, [2]Massbiologics, University of Massachusetts Medical School, Boston, MA, [3]Human Vaccine Institute, Duke University Medical Center, Durham, NC, USA

11:10 am **Live Video Question and Answer**

12:30 pm - 1:00 pm

Thomas Starzl State of the Art Lecture

12:35 pm **Development of Microbiota-Directed Complementary Foods for Treating Childhood Undernutrition**
Jeffrey Gordon, MD, Washington University School of Medicine , St. Louis, MO, USA

1:00 pm **Break**

Sponsored Satellite Symposia

1:30 pm - 2:30 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Advancing Care in Kidney Transplantation – Groundbreaking Findings from the ADMIRAL and K-OAR Studies

Supported by CareDx

Redefining the Management of CMV in SOT: Emerging Options for High-Risk Patients

Supported by an independent education grant from Takeda

2:30 pm **Break**

IMPACT Sessions

COVID-19

3:00 pm - 4:00 pm

Late-Breaking: Immune Response to COVID-19 Infection and Vaccination in Kidney Transplant Recipients

Moderators: Jonathan Maltzman, MD, PhD, FAST, Stanford University, Associate Professor, Palo Alto, CA, USA, Madhav Menon, MBBS, MD, Yale University School of Medicine, Associate Professor, New York, NY, USA

3:00 pm **Prevalence and Dynamics of SARS-COV-2 IgG in Kidney Transplant Recipients**
Yorg Azzi, MD, Montefiore Medical Center, Assistant Professor of Medicine, New York, NY, USA

3:15 pm **T Cell Immune Response to SARS-CoV-2 in Kidney Transplant Recipients**
Paolo Cravedi, MD, PhD, Mount Sinai, Associate professor, New York, NY, USA

3:30 pm **Antibody Response to mRNA Vaccination in Kidney Transplant Recipients**
Enver Akalin, M.D., Albert Einstein College of Medicine, Montefiore Medical Ctr, Professor of Medicine and Surgery, Bronx, NY, USA

3:45 pm **Live Video Question and Answer**

IMPACT Sessions

Kidney

3:00 pm - 4:00 pm

Is There Still a Role for Desensitization for Kidney Transplantation in the Modern Era?

Moderators: Robert Montgomery, MD, D Phil, FACS, NYU Langone Transplant Institute, H. Leon Pachter Chair and Professor of Surgery, New York, NY, USA, Carrie Schinstock, Medical Doctor, Mayo Clinic, Dr., Rochester, MN, USA

3:00 pm **Is There Still a Role for ABOi Kidney Transplantation**
Bonnie Lonze, MD, PhD, NYU Langone Transplant Institute, Assistant Professor, NEW YORK, NY, USA

3:10 pm **New Options for Desensitization for Kidney Transplantation**
Stanley Jordan, MD, Cedars Sinai Medical Ctr, Director Nephrology & Transplant Immunology, West Hollywood, CA, USA

3:20 pm **Have KAS and KPD Solved the Problem for Highly Sensitized Patients?**
Mark Stegall, MD, Mayo Clinic, James C. Masson Professor of Surgery Research, Rochester, MN, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Kidney
3:00 pm - 4:00 pm

Role of Surveillance Biopsy and Currently Approved Biomarkers for Diagnosing Acute Kidney Rejection: Clinical Application and Cost-effectiveness

Moderators: Jayme Locke, MD MPH FACS FAST, University of Birmingham at Alabama, Professor of Surgery | Chief, Division of Transplantation | Director, Comprehensive Transplant Institute, Birmingham, AL, USA, Sundaram Hariharan, MD, University of Pittsburgh Medical Center, Professor of Medicine and Surgery, Pittsburgh, PA, USA

3:00 pm **Use of Donor Derived cfDNA in Diagnosing Acute Kidney Transplant Rejection**
Alexander Weisman, MD, University of Colorado, Denver, CO, USA

3:10 pm **Use of Blood-based and Allograft Gene Biomarkers for Diagnosing Acute Kidney Transplant Rejection**
John Friedewald, MD, North Western University, Chicago, IL, USA

3:20 pm **Cost Effectiveness of Surveillance Biopsy and Currently Approved Biomarkers for Subclinical Kidney Transplant Rejection**
Chethan Puttarajappa, MD, University of Pittsburgh Medical Center, UPMC, Pittsburgh, PA, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Liver
3:00 pm - 4:00 pm

Liver Transplantation for Alcoholic Hepatitis

Moderators: Deepika Devuni, M.D, University of Massachusetts medical School, Assistant Professor, Worcester, MA, USA

3:00 pm **Standardization of Criteria for LT for AAH: Need for Guideline**
Andrew Cameron, MD, PhD, Johns hopkins

3:10 pm **Where are we now? Transplantation for Alcoholic Hepatitis: Current Status/ How to Improve the Reporting and Listing in UNOS?**
Gene Im, M.D., Icahn School of Medicine, Associate Professor of Medicine, New York, NY, USA

3:20 pm **Alcohol Use Disorders and Psychosocial Management: The Elephant in the Room**
Jessica Mellinger, MD, MSc, University of Michigan, Assistant Professor, Ann Arbor, MI, USA

3:30 pm **Case Against Liver Transplantation for Acute Alcoholic Hepatitis**
James Trotter, MD, Baylor Dallas, doctor, Dallas, TX, USA

3:40 pm **Live Video Question and Answer**

IMPACT Sessions

Liver
3:00 pm - 4:00 pm

Disparities in Liver Transplantation

Moderators: Therese Bittermann, MD, MSCE, University of Pennsylvania, Assistant Professor of Medicine and Epidemiology, Philadelphia, PA, USA, Anji Wall, MD PhD, Baylor University Medical Center, Abdominal Transplant Surgeon, Dallas, TX, USA

3:00 pm **Impact of Race on Candidacy and Outcomes**
Dinee Simpson, MD, Northwestern University, Chicago, IL, USA

3:10 pm **Impact of Socioeconomic Factors on Candidacy and Outcomes**
Jayme Locke, MD, MPH, FACS, FAST, University of Alabama at Birmingham, Professor of Surgery | Chief, Division of Transplantation | Director, Comprehensive Transplant Institute, Birmingham, AL, USA

3:20 pm **Impact of Obesity on Candidacy**
Jeffrey Kahn, MD, USC, Associate Professor of Clinical Medicine, Los Angeles, CA, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Prof Develop
3:00 pm - 4:00 pm

#MeToo in Academia: Enough is Enough!

Moderators: Deirdre Sawinski, MD, U Penn, Associate Professor of Medicine, Philadelphia, PA, USA, Samira Farouk, MD MS FASN, Icahn School of Medicine at Mount Sinai, Assistant Professor of Medicine & Medical Education, New York, NY, USA

3:00 pm **Let's Get Real (World): Dealing with Bias, Negotiation and Microaggressions Case Study**
Bethany Foster, MD, Montreal Children's Hospital of the McGill University Health Centre, Professor of Pediatrics, Montreal, QC, Canada

3:10 pm **The State of Women in Transplant Medicine: Summary of the Report by the AAMC**
Dianne McKay, MD, Scripps Research Institute

3:20 pm **Live Video Question and Answer**

IMPACT Sessions

Basic
3:00 pm - 4:00 pm

Innate Immune Cells and Allograft Rejection

Moderators: Valeria Mas, PhD, FAST, University of Maryland, Professor of Surgery, Baltimore, MD, USA, Anna Valujskikh, Cleveland Clinic, Cleveland, OH, USA

3:00 pm **Eosinophils in Lung Alloimmunity**
A. Sasha Krupnick, MD, University of Maryland, Professor of Surgery, Baltimore, MD, USA

3:10 pm **Neutrophils in Rejection**
Ankit Bharat, MD, Northwestern University, Harold & Margaret Method Professor, Chicago, IL, USA

3:20 pm **Live Video Question and Answer**

IMPACT Sessions

Basic
3:00 pm - 4:00 pm

Novel Targets for Transplant Immunosuppression

Moderators: Olivia Martinez, PhD, Stanford University School of Medicine, Professor and Director, Stanford, CA, USA, William Burlingham, PhD, University of Wisconsin, Professor Emeritus, Madison, WI, USA

3:00 pm **Disrupting Coronin 1 Signaling in T cell Promotes Allograft Tolerance While Maintaining Pathogen Responses**
Jean Pieters, PhD, University of Basel, Professor, Basel, Switzerland

3:10 pm **Ablating IRF4 Promotes Transplant Acceptance by Driving T cell Dysfunction**
Wenhao Chen, PhD, Houston Methodist, Role of IRF4 in transplant rejection and tolerance, Houston, TX, USA

3:20 pm **Live Video Question and Answer**

IMPACT Sessions

Translational
3:00 pm - 4:00 pm

The Science of Biomarkers, or the Lack Thereof

Moderators: Matthew Levine, MD PhD, University of Pennsylvania, Associate Professor of Surgery, Philadelphia, PA, USA

3:00 pm **Biomarkers of Rejection**
Peter Heeger, MD, Icahn School of Medicine at Mount Sinai, Professor of Medicine, New York, NY, USA

3:10 pm **Biomarkers in Acute Kidney Injury**
Joseph Bonventre, MD PhD, Brigham and Women's Hospital, Samuel A Levine Distinguished Professor of Medicine, Harvard Medical School. Chief Division of Renal Medicine, Boston, MA, USA

3:20 pm **Challenges in Practical Application of Biomarkers in Transplantation**
Roslyn Mannon, MD, University of Alabama, Professor of Medicine, Birmingham, AL, USA

3:30 pm **Live Video Controversy Discussion: Should We HLA Match in Organ Allocation - Yes**
Peter Nickerson, MD, University of Manitoba, Distinguished Professor, Vice Dean (Research), Winnipeg, MB, Canada

3:35 pm **Live Video Controversy Discussion: Should We HLA Match in Organ Allocation - No**
Howard Gebel, PhD, Emory University, Atlanta, GA, USA

3:40 pm **Live Video Question and Answer**

IMPACT Sessions

ID
3:00 pm - 4:00 pm

Optimizing the Use of HCV-Infected Organs - The Implementation Phase: When to Treat and Why?

Moderators: Christine Durand, MD, Johns Hopkins University, Associate Professor, Baltimore, MD, USA, David Goldberg, MD, MSCE, University of Miami, Associate professor of Medicine, Miami, FL, USA

3:00 pm **Impact on Utilization, Procurement and Waiting Times: Have HCV-viremic Organs Fulfilled their Promise?**
Ann Woolley, MD, MPH, Brigham and Womens Hospital, Infectious Diseases, Boston, MA, USA

3:10 pm **Practical Approaches to Antiviral Therapy: How and When to Treat, and What to do When Treatment Fails**
Norah Terrault, MD, MPH, University of Southern California, Professor of Medicine, Los Angeles, CA, USA

3:20 pm **When Chronic HCV has Company**
Michael Leise, MD, Mayo Clinic, Associate Professor of Medicine, Rochester, MN, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Pharmacy
3:00 pm - 4:00 pm

Innovative and Effective Tools to Reduce Hospital Readmissions Post-Transplant from the Viewpoint of a Transplant Physician, Pharmacist and Advance Practice Provider

Moderators: Demetra Tsapepas, PharmD, MBA, New York Presbyterian Hospital, New York, NY, USA

3:00 pm **Impact of Adverse Drug Events Contributing to Hospital Readmissions in Kidney Transplant Recipients and Strategies to Overcome**
David Taber, PharmD, MS, BCPS, Med Univ of South Carolina, Professor, Charleston, SC, USA

3:10 pm **Not Just Physicians: The Expanded Role of Advanced Practice Providers to Improve Care Continuity and Reduce Hospital Readmissions Post Transplantation**
Samantha Halpern, MSN, CRNP, Hospital of the University of Pennsylvania, Transplant Nurse Practitioner, Philadelphia, PA, USA

3:20 pm **See you at Home: Telemedicine-based Home Monitoring Program to Reduce Readmissions Post Liver Transplantation.**
Shimul Shah, MD, MHCM, University of Cincinnati, Professor and Chief, Solid Organ Transplantation, Cincinnati, OH, USA

3:30 pm **Live Video Question and Answer**

Sponsor Networking
4:00 pm - 4:30 pm

Rapid Fire Oral Abstracts

Basic
4:30 pm - 5:30 pm

B cell/Antibody and Histocompatibility

Moderator: Malek Kamoun, MD PhD, Hospital Univ of Pennsylvania, Professor, Pathology and Laboratory Medicine, Philadelphia, PA, USA

4:30 pm **The Role of Notch2 in Antibody-mediated Alloimmune Response**
R. Benedetti Gassen[1], N. Murakami[2], T. J Borges[1], A. Al Jurdi[1], A. Alessandrini[1], L. V Riella[1], *[1]Center of Transplantation Science, Massachusetts General Hospital, Boston, MA, [2]Brigham and Women's Hospital, Boston, MA*

4:35 pm **Marginal Zone B Cells Support Donor-Specific Alloantibody Responses to Heart Allografts**
V. Gorbacheva, R. Fan, W. Baldwin, R. Fairchild, A. Valujskikh, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

4:40 pm **Acoustofluidic Device to Remove Donor Specific Antibody in a Sensitized Animal Model**
J. Kwun[1], E. David[2], Y. Gu[3], Z. Ma[3], M. Kuchibhatla[4], G. Arepally[5], T. J. Huang[3], E. T. Chambers[2], *[1]Surgery, Duke University, Durham, NC, [2]Pediatrics, Duke University, Durham, NC, [3]Biomedical Engineering, Duke University, Durham, NC, [4]Biostatistics and Bioinformatics, Duke University, Durham, NC, [5]Internal Medicine, Duke University, Durham, NC*

4:45 pm **Cd4 T Cells Can Trigger Nk-dependent Chronic Rejection Independent of Antibodies**
R. G. Gill[1], B. Mehrad[2], C. M. Lin[2], *[1]Surgery, University of Colorado Denver, Aurora, CO, [2]Medicine, University of Florida, Gainesville, FL*

4:50 pm **Blood Type A2/a2b to B Renal Transplantation: A Single Center Retrospective Cohort Study**
V. S. Tatapudi, N. Alnazari, R. Chand, N. M. Ali, B. E. Lonze, R. A. Montgomery, *NYU Langone Transplant Institute, NYU Langone Health, New York, NY*

4:55 pm **Low Immunogenic Donors Improve Kidney Transplant Survival in Sensitized Recipients**
D. Bekbolsynov[1], R. Green[2], B. Mierzejewska[1], M. Rees[1], S. Stepkowski[1], *[1]University of Toledo, Toledo, OH, [2]Bowling Green State University, Bowling Green, OH*

5:00 pm **Association Between HLA Class II and TLR4 Regulates HLA-II Stimulated P-selectin Expression and Monocyte Capture to Endothelial Cells**
Y. Jin, J. Nevarez-Mejia, E. F. Reed, *Pathology and Laboratory Medicine, University of California Los Angeles, Los Angeles, CA*

5:05 pm **Risk Stratification of Kidney Transplant Patients According to the Different Level of HLA-DQ Disparities**
A. Senev[1], A. R. Tambur[2], M. Naesens[1], *[1]Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium, [2]Northwestern University, Chicago, IL*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Basic
4:30 pm - 5:30 pm

Biomarkers, Immune Assessment and Clinical Outcomes - III

Moderators: Mamatha Bhat, MD, MSc, FRCPC, University Health Network, Assistant Professor of Medicine, Toronto, ON, Canada, Juliet Emamaullee, MD, PhD, FRCSC FACS, University of Southern California, Assistant Professor of Clinical Surgery, Los Angeles, CA, USA

4:30 pm **Use of a Novel Bead-based Assay to Measure the Impact of Imlifidase on ABO IgG Antibodies**
A. Halpin[1], B. Motyka[2], T. Ellis[2], J. Pearcey[2], T. L. Lowary[3], A. Runström[4], L. Winstedt[4], R. Bockermann[4], S. Järnum[4], A. Robertson[4], L. J. West[5], *[1]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta and Alberta Precision Laboratories, Edmonton, AB, Canada, [2]Department of Pediatrics, University of Alberta, Edmonton, AB, Canada, [3]Department of Chemistry, University of Alberta, Edmonton, AB, Canada, [4]Hansa Biopharma, Lund, Sweden, [5]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta, Edmonton, AB, Canada*

4:35 pm **High Levels of Donor-Derived Cell-Free DNA Predict EGFR Decline After Kidney Transplantation**
T. Alhamad[1], V. Bowers[2], E. Stites[3], S. Anand[4], J. S. Bromberg[5], H. Murad[1], G. Gupta[6], I. Moinuddin[6], L. Bu[7], S. Ghosh[8], J. Zeng[8], A. Pai[9], *[1]Washington University in St. Louis, St. Louis, MO, [2]Tampa General Hospital, Tampa, FL, [3]University of Colorado, Aurora, CO, [4]Intermountain Medical Center, Murray, UT, [5]University of Maryland School of Medicine, Baltimore, MD, [6]Virginia Commonwealth University, Richmond, VA, [7]University of Minnesota, Minneapolis, MN, [8]CareDx, Brisbane, CA, [9]University of Texas McGovern Medical School, Houston, TX*

4:40 pm **Assessment of Donor-Derived Cell-Free DNA Performance Characteristics Across the Spectrum of TCMR and ABMR After Kidney Transplant**
L. Bu[1], S. Anand[2], A. Pai[3], J. S. Bromberg[4], T. Alhamad[5], V. Bowers[6], I. Moinuddin[7], S. Ghosh[8], W. Tian[8], E. Stites[9], G. Gupta[7], *[1]University of Minnesota, Minneapolis, MN, [2]Intermountain Medical Center, Murray, UT, [3]University of Texas McGovern Medical School, Houston, TX, [4]University of Maryland School of Medicine, Baltimore, MD, [5]Washington University in St. Louis, St. Louis, MO, [6]Tampa General Hospital, Tampa, FL, [7]Virginia Commonwealth University, Richmond, VA, [8]CareDx, Brisbane, CA, [9]University of Colorado, Aurora, CO*

4:45 pm **Intrarenal B-cell Activating Factor (BAFF) Levels are Increased in Transplant Glomerulopathy**
S. Panzer, K. Swanson, G. Pandya, L. Hidalgo, S. Reese, *University of Wisconsin Madison, Madison, WI*

4:50 pm **Utility of Non-Invasive Rejection Biomarkers to Guide Immunomodulation in Kidney Transplant Patients with Active Covid-19 Infection**
J. Christensen, G. Gupta, A. Bryson, S. Paluri, R. Thompson, S. Sterling, N. Vissichelli, P. Kimball, D. Kumar, *VCUHealth, Richmond, VA*

4:55 pm **The Role of Donor-derived Cell-free DNA to Detect Subclinical Acute Rejection in Kidney Allograft**
S. Park[1], K. Guo[2], R. Heilman[3], E. Poggio[4], D. Taber[5], C. Marsh[6], S. Kurian[7], S. Kleiboeker[8], J. Weems[9], J. Holman[10], L. Zhao[2], R. Sinha[8], S. Brietigam[2], C. Rebello[2], M. Abecassis[11], J. Friedewald[1], *[1]Transplant nephrology, Northwestern University, Chicago, IL, [2]Feinberg School of Medicine, Northwestern University, Chicago, IL, [3]Transplant nephrology, Mayo Clinic College of Medicine and Science, Phoenix, AZ, [4]Department of Nephrology and Hypertension, Cleveland Clinic, Cleveland, OH, [5]Division of Transplant Surgery, Medical University of South Carolina, Charleston, SC, [6]Department of Medicine and Surgery, Scripps Clinic and Green Hospital, La Jolla, CA, [7]Scripps Health, La Jolla, CA, [8]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [9]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [10]Transplant Genomics, Inc, Mansfield, MA, [11]University of Arizona College of Medicine, Northwestern University, Tucson, AZ*

5:00 pm **MDR-101-MLK-MERCURY Kidney Transplant Tolerance Study Update**
D. Kaufman[1], S. Akkina[2], M. Stegall[3], J. Piper[4], A. O. Gaber[5], E. Marin[6], S. Busque[7], D. Alonso[8], M. De Vera[9], A. Shah[10], A. Patel[11], K. Chavin[12], M. Laftavi[13], S. Collette[14], E. Stites[15], M. Mai[16], M. Cooper[17], D. Brennan[18], *[1]Surgery, UW, Madison, WI, [2]Surgery, Loyola, Chicago, IL, [3]Surgery, Mayo, Rochester, MN, [4]Surgery, Inova, Fairfax, VA, [5]Surgery, Houston Methodist, Houston, TX, [6]Nephrology, Yale, New Haven, CT, [7]Surgery, Stanford, San Francisco, CA, [8]Surgery, Intermountain, Murray, UT, [9]Surgery, Loma Linda, Loma Linda, CA, [10]Surgery, TJU, Philadelphia, PA, [11]Nephrology, St. Barnabas, Livingston, NJ, [12]Surgery, UHH, Cincinnati, OH, [13]Surgery, Upstate, Syracuse, NY, [14]Surgery, CIUSSS, Montreal, ON, Canada, [15]Nephrology, UC Denver, Denver, CO, [16]Nephrology, Mayo - FL, Jacksonville, FL, [17]Surgery, Georgetown, Washington, DC, [18]Medeor, San Francisco, CA*

5:05 pm **Kidney Transplant Rejection Can Be Diagnosed or Even Predicted by Tracking Donor Reactive T Cell Clones in Post-transplant Samples**
Y. Sambandam[1], M. Kandpal[1], J. He[1], X. Huang[1], T. S. Taylor[1], A. A. Shetty[2], J. M. Mathew[1], J. R. Leventhal[1], *[1]Surgery-Comprehensive Transplant Center, Northwestern University Feinberg School of Medicine, Chicago, IL, [2]Medicine, Nephrology Division, Northwestern University Feinberg School of Medicine, Chicago, IL*

6:00 pm **Sequential Analysis of Renal Allograft Rejection at Single Cell Resolution**
T. Shi[1], C. Castro-Rojas[1], A. Burg[1], K. Roskin[1], J. Rush[2], B. Haraldsson[2], A. Shields[3], R. Alloway[3], E. Woodle[3], D. Hildeman[1], *[1]Immunobiology, Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [2]Novartis Pharmaceuticals AG, Basel, Switzerland, [3]University of Cincinnati Medical Center, Cincinnati, OH*

6:05 pm **LTβR Engagement Regulates Treg Migration, Stability and Suppressor Function**
V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

6:10 pm **CEACAM1 Signaling is Essential to Elicit Tim-3 Inhibitory Regulation in Liver Transplantation**
H. Kojima, H. Hirao, T. Ito, K. Kadono, K. J. Dery, F. M. Kaldas, J. W. Kupiec-Weglinski, *The Dumont-UCLA Transplantation Center, Los Angeles, CA*

6:15 pm **Laminins Differentially Regulate Adaptive Alloimmune Responses**
L. Li[1], M. Shirkey[1], W. Piao[1], Y. Xiong[1], V. Saxena[1], T. Zhang[1], J. Iyyathurai[2], R. Lakhan[1], R. Abdi[3], J. Bromberg[1], *[1]Surgery, UMB, Baltimore, MD, [2]CVID, UMB, Baltimore, MD, [3]Harvard University, Boston, MA*

6:20 pm **TIGIT Identifies Polyfunctional Donor-Specific CD4+ T Cells Lost After Kidney Transplantation**
A. C. van der List, N. H. Litjens, M. G. Betjes, M. Klepper, *Nephrology and Transplantation, Erasmus MC, Rotterdam, Netherlands*

6:25 pm **TOLS are Novel Regulatory TLOs with A B Cell Signature**
I. Rosales[1], Q. Yuan[1], C. Yang[1], P. Russell[1], J. Madsen[1], A. Alessandrini[1], R. Colvin[1], -. AA and RC[2], *[1]Massachusetts General Hospital, Boston, MA, [2]Co-Senior Authors, Boston, MA*

6:30 pm **Successful Induction of Hematopoietic Chimerism by Dual Inhibition of Mcl-1 and Bcl-2 Without Myeloablative Treatments in Nonhuman Primates**
T. Hirose, D. Ma, G. Lassiter, T. Kawai, *Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA*

6:35 pm **Increased T Cell Cross-dressing in Accepted Kidney Allografts**
Q. Yuan[1], S. Hong[2], E. Szuter[2], I. Rosales[2], Y. Zhao[2], B. Gonzalez-Nolasco[2], G. Benichou[2], P. Russell[2], J. Madsen[2], R. Colvin[2], A. Alessandrini[2], *[1]Massachusetts General Hospital/Chinese PLA General Hospital, Boston, MA, [2]Massachusetts General Hospital, Boston, MA*

6:40 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Basic
6:00 pm - 7:00 pm

Rejection, Innate Immunity and Allorecognition

Moderators: Naoka Murakami, MD PhD, Brigham and Women's Hospital, Instructor, Boston, MA, USA, Heth Turnquist, PhD, Univ of Pittsburgh, T.E. Starzl Transplant Institute, Associate Professor, Pittsburgh, PA, USA

6:00 pm **Dna-pkcs Regulation of the Allogeneic Immune Response**
L. Burdine, M. Burdine, Z. Waldrip, D. Harrison, *University of Arkansas, Little Rock, AR*

6:05 pm **P40 Homodimers Induce Il-15 to Promote Endogenous Donor-reactive Memory Cd8 T Cell Activation within High-risk Cardiac Allografts**
H. Tsuda, A. Valujskikh, R. Fairchild, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

6:10 pm **Contribution of T-bet Expressing CD27+ CD21- Activated Memory B Cells Poised for Plasma Cell Differentiation to Antibody-mediated Rejection of Kidney Transplants**
K. Louis[1], E. Bailly[1], C. Macedo[1], B. Ramaswami[1], X. Gu[1], G. Chalasani[1], A. Zeevi[1], P. Randhawa[1], H. Singh[2], C. Lefaucheur[3], D. Metes[1], *[1]Surgery, University of Pittsburgh, Pittsburgh, PA, [2]Center for Systems immunology, Department of Immunology, University of Pittsburgh, Pittsburgh, PA, [3]Human Immunology and Immunopathology, INSERM U976, Paris, France*

6:15 pm **Donor Mhc-independent Islet Rejection in Autoimmune Diabetes: Implications for Stem Cell Therapy**
R. G. Gill[1], M. Coulombe[2], K. S. Beard[1], A. L. Burrack[3], *[1]University of Colorado, Aurora, CO, [2]Surgery, University of Colorado, Aurora, CO, [3]Mircrobiology and Immunology, University of Minnesota, Minneapolis, MN*

6:20 pm **Accelerated Bronchiolitis Obliterans After Lung Transplant Promoted by an ATG16L1 Mutation is Coupled to Mitochondrial Damage and Metabolic Alterations in Monocyte-derived Antigen Presenting Cells**
M. Cano[1], D. Zhou[1], D. Kreisel[1], C. Chen[2], K. Pugh[1], D. Byers[1], R. Hachem[1], A. Gelman[1], *[1]Washington University, Saint Louis, MO, [2]UT Southwestern Medical Center, Dallas, TX*

6:25 pm **Resolution of Endothelial Inflammation is Delayed Following IFNγ, Which Provokes a Long-lasting Pro-adhesive Phenotype Dependent on JAK/STAT Signaling**
N. M. Valenzuela, *Pathology and Laboratory Medicine, UCLA, Los Angeles, CA*

6:30 pm **PD-1/PD-L1 Selectively Regulates Treg Lymphatic Migration**
W. Piao[1], L. Li[1], C. Paluskievicz[1], Y. Zhang[2], V. Saxena[3], K. Hippen[2], B. Blazar[2], L. Riella[4], J. Bromberg[1], *[1]Surgery, U Maryland, Baltimore, MD, [2]U Minnesota, Minneapolis, MN, [3]U Maryland, Baltimore, MD, [4]Harvard U, Boston, MA*

6:35 pm **Ikaros-SIRT1 Signaling Axis Regulates Macrophage Polarization and Ischemia Reperfusion Injury in Mouse and Human Liver Transplantation**
K. Kadono[1], H. Hirao[1], H. Kojima[1], K. J. Dery[1], X. Li[2], J. W. Kupiec-Weglinski[1], *[1]The Dumont-UCLA Transplant Center, Los Angeles, CA, [2]NIEHS, Durham, NC*

6:40 pm **Live Video Question and Answer**

7:00 pm **Break**

Sponsor Networking
7:30 pm - 8:30 pm

Poster Video Chat

Basic
7:30 pm - 8:30 pm

Basic 1
Moderators: Megan Sykes, MD, Columbia University, Professor, Columbia University, Director, Columbia Center for Translational Immunology, New York, NY, USA, Stefan Tullius, MD, PhD, Brigham & Women's Hospital, Chief, Division of Transplant Surgery, Boston, MA, USA

7:30 pm **Atg16l-Dependent Autophagy Attenuates Procession of Renal Interstitial Fibrosis in Chronic Renal Graft Dysfunction via Regulating Tumor Necrosis Factor Alpha (tnf-α) Induced Endmt**
Z. Gui, Z. Wang, Z. Han, J. Tao, X. Ju, R. Tan, M. Gu, *The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

7:40 pm **Single-Cell RNA-seq Identifies Intra-Graft Population Heterogeneity in Acute Heart Allograft Rejection in the Mouse**
C. Wu[1], Y. Tang[1], X. Shi[1], X. He[1], X. Li[2], *[1]The First Affiliated Hospital,Sun Yat-sen University, Guangzhou, China, [2]Immunobiology & Transplant Sciences Houston Methodist Hospital, Houston, TX*

7:50 pm **Extracellular Matrix Injury of Kidney Allografts in Antibody-mediated Rejection**

S. Clotet Freixas[1], C. McEvoy[1], I. Batruch[2], C. Pastrello[3], M. Kotlyar[3], J. Van[1], M. Arambewela[1], A. Boshart[1], S. Farkona[1], Y. Niu[3], Y. Li[1], O. Famure[1], A. Bozovic[4], V. Kulasingam[4], P. Chen[1], J. S. Kim[1], E. Chan[5], S. Moshkelgosha[1], S. A. Rahman[6], J. Das[6], T. Martinu[1], S. Juvet[1], I. Jurisica[3], A. Chruscinski[1], R. John[1], A. Konvalinka[1], *[1]Toronto General Hospital Research Institute, University Health Network, Toronto, ON, Canada, [2]Department of Laboratory Medicine and Pathobiology, Lunenfeld-Tanenbaum Research Institute, Mount Sinai Hospital, Toronto, ON, Canada, [3]Krembil Research Institute, University Health Network, Toronto, ON, Canada, [4]Department of Laboratory Medicine and Pathobiology, University of Toronto, Toronto, ON, Canada, [5]Department of Medicine, Division of Nephrology, University Health Network, Toronto, ON, Canada, [6]Center for Systems Immunology, University of Pittsburgh School of Medicine, Pittsburgh, PA*

8:00 pm **Laminin Alpha 4 and Alpha5 Differentially Regulate Lymph Node Tolerogenic Structure**

L. Li[1], M. Shirkey[1], W. Piao[1], Y. Xiong[1], V. Saxena[1], T. Zhang[1], J. Iyyathurai[2], R. Lakhan[1], R. Abdi[3], J. Bromberg[1], *[1]Surgery, UMB, Baltimore, MD, [2]CVID, UMB, Baltimore, MD, [3]Harvard University, Boston, MD*

8:10 pm **Short-term Therapy with Anti-icam-1 Monoclonal Antibody Induced Long-term Liver Allograft Survival in Non-human Primates**

S. Hong[1], D. Han[2], S. Lee[2], J. Kim[3], E. Hwang[3], H. Kim[4], J. Lee[5], K. Hong[1], E. Han[1], J. Cho[1], J. Lee[1], Y. Choi[1], K. Lee[1], N. Yi[1], J. Yang[1], K. Suh[1], *[1]Surgery, Seoul National University College of Medicine, Seoul, Korea, Republic of, [2]Biomedical Research Institute, Seoul National University College of Medicine, Seoul, Korea, Republic of, [3]Microbiology and Immunology, Seoul National University College of Medicine, Seoul, Korea, Republic of, [4]Pathology, Seoul National University College of Medicine, Seoul, Korea, Republic of, [5]Medicine, Seoul National University College of Medicine, Seoul, Korea, Republic of*

7:30 pm – 8:30 pm	**Poster Video Chat**
8:45 pm – 9:30 pm	**Expert VIP Meet Up**

Welcome
8:45 am – 9:00 am

IMPACT Sessions
Kidney
9:00 am - 10:00 am

What's New in the KDIGO Clinical Practice Guideline on the Evaluation and Management of Candidates for Kidney Transplantation?
Moderators: Greg Knoll, MD, The Ottawa Hospital, Head, Division of Nephrology, Ottawa, ON, Canada, Steve Chadban, MD, Royal Prince Alfred Hospital, Professor, Sydney, Australia

9:00 am **Perioperative Challenges in Managing Patients with Obesity, Frailty and Patients Requiring Perioperative Anticoagulation**
David Axelrod, MD, MBA, University of Iowa, Professor of Surgery, Iowa City, IA, USA

9:10 am **Patients with Prior Advanced Stage Cancer- What Should be Considered?**
Germaine Wong, MBBS PhD FRACP, University of Sydney, Professor, Sydney, Australia

9:20 am **Unique Considerations for Screening and Prevention of Infectious Diseases in Kidney Transplant Candidates**
Deepali Kumar, MD, University Health Network, Toronto, ON, Canada

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Kidney
9:00 am - 10:00 am

To Stent or Not to Stent - That is the Ureteral Question
Moderators: Vikas Dharnidharka, MD, MPH, Washington University, Professor and Vice-Chair, Pediatrics, St. Louis, MO, USA, Hans Gritsch, MD, UCLA, Surgical Director of Kidney Transplantation, Los Angeles, CA, USA

9:00 am **To Stent or Not to Stent - That is the Ureteral Question - Setting the Stage**
Dan Brennan, MD, FACP, Johns Hopkins Medical Institute, Professor of Medicine, Baltimore, MD, USA

9:10 am **Pro: To Stent or Not to Stent - That is the Ureteral Question**
Hans Gritsch, MD, UCLA, Surgical Director of Kidney Transplant, Los Angeles, CA, USA

9:20 am **Con: To Stent or Not to Stent - That is the Ureteral Question**
Vikas Dharnidharka, MD, MPH, Washington University, Professor and Vice-Chair, Pediatrics, St. Louis, MO, USA

9:30 am **Live Video Rebuttal, Question and Answer**

IMPACT Sessions
Liver
9:00 am - 10:00 am

Weighing in on Bariatric Surgery and Liver Transplantation
Moderators: Elizabeth Carey, MD, Mayo Clinic Scottsdale, Phoenix, AZ, USA, Andrew Posselt, MD, UCSF, Professor of Surgery, San Francisco, CA, USA

9:00 am **Facing the Obesity Challenge in the Liver Transplant Candidate**
Elizabeth Carey, MD, Mayo Clinic, Transplant Hepatologist, Phoenix, AZ, USA

9:10 am **Pro: Bariatric Surgery Cures Obesity and Improves Outcomes after Transplant**
Caroline Jadlowiec, MD, Mayo Clinic Arizona, Dr., Phoenix, AZ, USA

9:20 am **Con: Bariatric Surgery is Not the Answer**
Sumeet Asrani, MD, Liver Consultants of Texas, Dallas, TX, USA

9:30 am **Live Video Rebuttal, Question and Answer**

IMPACT Sessions

VCA
9:00 am - 10:00 am

VCA - Is there a way Forward to Standard of Care?

Moderators: William Kitchens, MD, PhD, Emory University School of Medicine, Assistant Professor of Surgery, Atlanta, GA, USA, Darla Granger, MD, MBA, Ascension St John Hospital, Section Chief, Transplant Surgery, Detroit, MI, USA

9:00 am **Insurance Coverage for VCA**
Jon Friedman, MD, FAST, Optum Health Medical Benefit Management, Chief Medical Officer, Manhattan Beach, CA, USA

9:10 am **Outcomes Analysis in VCA**
Hatem Amer, MD, Mayo Clinic, Associate Professor of Medicine, Rochester, MN, USA

9:20 am **Ethical Considerations in VCA**
Jim Rodrigue, PhD, Department of Surgery, Beth Israel Deaconess Medical Center, Professor & Vice Chair (Surgery), Boston, MA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Pediatric
9:00 am - 10:00 am

Vaccinating the Unvaccinated Prior to Transplant: Challenges and Opportunities

Moderators: Asha Moudgil, MD, Children's National Med. Ctr., Director, Pediatric Transplant, Washington, DC, USA

9:00 am **What are the Risks and Benefits of Vaccination in Transplant Candidates and Recipients**
Marian Michaels, MD MPH, Childrens Hosp of Pittsburgh, Pittsburgh, PA, USA

9:10 am **The Epidemiology of Non-vaccination in 2021**
Priya Verghese, MD, MPH, Ann & Robert H. Lurie Children's Hospital of Chicago, Professor & Division Head, Chicago, IL, USA

9:20 am **To Transplant or Not to Transplant if Families Do Not Comply**
Paul Grimm, MD, Stanford University, Prof. of Pediatrics, Stanford, CA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Basic
9:00 am - 10:00 am

Integrated Molecular Approach to Chronic Allograft Injury

Moderators: Enver Akalin, M.D., Albert Einstein College of Medicine, Montefiore Medical Ctr, Professor of Medicine and Surgery, Bronx, NY, USA

9:00 am **Small RNA Sequencing of Human Kidney Allografts with or without Tubulointerstitial Fibrosis**
Manikkam Suthanthiran, MD, Weill Cornell Med Ctr., New York, NY, USA

9:10 am **Molecular Pathways and Chronic Kidney Disease**
Katalin Susztak, University of Pennsylvania, Philadelphia, PA, USA

9:20 am **Effect of Epigenetic Modifications on Molecular Pathways Leading to Chronic Allograft Injury and Dysfunction: Application of Integrated Approaches**
Valeria Mas, PhD, FAST, University of Maryland, Professor of Surgery, Baltimore, MD, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

HLA
9:00 am - 10:00 am

ABO Incompatible Transplantation from Genetics to Transplantation

Moderators: Kristina Davis, MD, University of Michigan, Ann Arbor, MI, USA; Jayme Locke, MD, MPH, University of Alabama at Birmingham, Birmingham, AL, USA

9:00 am **New Tools for ABO Characterization**
Anne Halpin, MSc CHS, University Alberta, Ms, Edmonton, AB, Canada

9:10 am **Clinical Implementation of ABO Incompatible Transplantation and Immunosuppression**
Andrew Bentall, MBChB, Mayo Clinic, Transplant Nephrologist, Rochester, MN, USA

9:20 am **ABOi Transplantation and Unmet Needs**
Lori West, MD, DPhil, FRCPC, University of Alberta, Professor, Edmonton, AB, Canada

9:30 am **ABO Subtypes & Clinical Implementation**
Simon Ball, MD, University Hospital Birmingham, Dr, Birmingham, United Kingdom

9:40 am **Live Video Question and Answer**

IMPACT Sessions

ID
9:00 am - 10:00 am

Travel, Food, and Leisure

Moderators: Yoram Puius, MD, PhD, Montefiore Medical Center, Bronx, NY, USA, Nancy Law, D.O, M.P.H, Universtiy of California, San Diego, San Diego, CA, USA

9:00 am **Travel - Can I Travel There?**
Camille Kotton, MD, Infectious Diseases Division, Clinical Director, Transplant Infectious DIseases, Newton, MA, USA

9:10 am **Food - Can I Eat This?**
Maricar Malinis, MD, Yale School of Medicine, Associate Professor of Medicine and Surgery (Transplant), New Haven, CT, USA

9:20 am **Leisure - Can I do That?**
Steven Pergam, MD, Fred Hutchinson Cancer Research Center, Associate Professor, Seattle, WA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Other: Heart
9:00 am - 10:00 am

Uh Oh, My New Home is a Lemon: Cardiovascular Disease after Solid Organ Transplant

Moderators: Darshana Dadhania, M.D., Weill Cornell Medicine - NYPH, Associate Professor of Medicine, New York, NY, USA, Lisa Van Wagner, MD MSc FAST FAHA, Northwestern University, Assistant Professor, Chicago, IL, USA

9:00 am **How Much Does the Plumber Want for Clogged Pipes? Coronary Artery Disease after Transplant**
Jagbir Gill, MD, Univ of British Columbia

9:10 am **Put on the Sweater, the Heat Circulation is Broken. Heart Failure After**
Maryse Palardy, MD, University of Michigan, Clinical Assistant Professor, Ann Arbor, MI, USA

9:20 am **Has the Ground Shifted? These Doors Won't Close: Valvular Disease after Transplant**
Jose Tallaj, MD, Univ of Alabama at Birmingham (UAB), Professor of Medicine, Birmingham, AL, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Admin
9:00 am - 10:00 am

Bridge Over Troubled Water: OPTN Policy Development, Directions, and Innovations

Moderators: David Klassen, MD, United Network for Organ Sharing, Chief Medical Officer, Richmond, VA, USA, Lloyd Ratner, MD, Columbia, Professor of Surgery; Director - Renal & Pancreatic Transplantation, New York, NY, USA

9:00 am **OPTN Policy Development: How You Can Shape Policy**
Matthew Cooper, MD, Georgetown, Director, Kidney and Pancreas Transplantation, Washington, DC, USA

9:10 am **Geography and Allocation: a Continuous Evolution**
Darren Stewart, MS, United Network for Organ Sharing, Principal Research Scientist, Richmond, VA, USA

9:20 am **Expedited Kidney Placement Project Results: It's Not What you Think**
Samantha Noreen, PhD, UNOS, Research Scientist, Richmond, VA, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Women's Health
9:00 am - 10:00 am

Surgical Approaches to Address Sex-based Disparities in Access to Appropriately Sized Organs

Moderators: Matthew Hartwig, MD, Duke University, Durham, NC, USA, Waldo Concepcion, MD Professor of Surgery, Mohammed Bin Rashid University of Medicine, Director of Transplantation Services Al Jalila Children's Specialty Hospital, Dubai, United Arab Emirates

9:00 am **Cutting it Down to Size - Lung Resizing**
Jasleen Kukreja, MD, UCSF Medical Center, MD, San Francisco, CA, USA

9:10 am **Two for the Price of One - Split Livers**
Jorge Reyes, Professor of Surgery, University of Washington, Chief Transplant Surgery University of Washington, Director of Transplantation Seattle Children's Ho, Seattle, WA, USA

9:20 am **Small for Small - Broader use of Pediatric Donor Organs**
Richard Perez, MD, University California Davis Medical Center, Sacramento, CA, USA

9:30 am **Live Video Question and Answer**

10:00 am **Break**

Innovations in Transplantation
10:30 am - 10:50 am

Innovations in Transplantation

Moderators: Maryl Johnson, MD, Univ of Wisconsin-Madison, Madison, WI, USA, Linda Cendales, MD, Duke University Medical Center, Durham, NC, USA

10:30 am **Human Tracheal Transplantation**
Eric Genden, MD, MAH, The Icahn School of Medicine at Mount Sinai, New York, NY, USA

10:40 am **Live Video Question and Answer**

Plenary Session 4

10:50 am - 11:50 am

Moderators: Linda Cendales, MD, Duke University Medical Center, Durham, NC, USA, Maryl Johnson, MD, Univ of Wisconsin-Madison, Professor of Medicine, Madison, WI, USA

10:50 am **Superior Post-transplant Clinical Outcomes Using Portable Normothermic Perfusion and Assessment with the Organ Care System (ocs) Liver System: 1-year Outcomes of the Ocs Liver Protect Randomized Controlled Trial**

J. Markmann[1], M. Abouljoud[2], M. Ghobrial[3], C. Bhati[4], S. Pelletier[5], J. Magliocca[6], T. Pruett[7], A. Lu[8], M. Rizzari[9], S. Ottmann[10], T. Klair[11], C. Eymard[12], G. Roll[13], G. Reyes[14], S. Black[15], S. Florman[16], S. Mirani[17], C. Marsh[18], G. Schnickel[19], M. Kinkhabwala[20], A. Demetris[21], H. Yeh[22], P. Vagefi[23], M. MacConmara[23], [1]MGH, Boston, MA, USA, [2]Henry Ford, Detroit, MI, USA, [3]Houston Methodist, Houston, TX, USA, [4]Virginia Commonwealth, Richmond, VA, USA, [5]UVA, Charlottesville, VA, USA, [6]Emory, Atlanta, GA, USA, [7]U. Minnesota, Minneapolis, MN, USA, [8]Tampa General, Tampa, FL, USA, [9]Henry Ford, Detriot, MI, USA, [10]Johns Hopkins, Baltimore, MD, USA, [11]University of Texas HSC, San Antonio, TX, USA, [12]University of Tennessee HSC, Memphis, TN, USA, [13]UCSF, San Francisco, CA, USA, [14]U. Washington, Seattle, WA, USA, [15]Ohio State, Columbus, OH, USA, [16]Mt. Sinai, New York, NY, USA, [17]U. Nebraska, Omaha, NE, USA, [18]Scripps Clinic, San Diego, CA, USA, [19]U. San Diego, San Diego, CA, USA, [20]Montefiore, New York, MA, USA, [21]UPMC, Pittsburgh, PA, USA, [22]Massachusetts General Hospital, Boston, MA, USA, [23]UT Southwestern, Dallas, TX, USA

11:00 am **Novel Discovery of Super-antigen That Mobilize Regulatory Cd8 T Cells Inhibits Donor-specific Antibody and Protects Heart Allografts from Antibody-mediated Rejection**

J. Y. Choi[1], H. Nakagawa[2], Z. Solhjou[1], K. Yatim[1], H. Zhang[3], P. Patel[3], M. Tawfeek Mohammed[3], L. Riella[4], H. Kim[2], H. Cantor[2], J. Azzi[1], [1]Brigham and Women's Hospital/Harvard Medical School, Boston, MA, USA, [2]Dana Farber Cancer Institute/ Harvard Medical School, Boston, MA, USA, [3]Brigham and Women's Hospital, Boston, MA, USA, [4]Massachusetts General Hospital/Harvard Medical School, Boston, MA, USA

11:10 am **Extreme Phenotype Sampling and Next Generation Sequencing to Identify Genetic Variants Associated with Tacrolimus Metabolism in African American Kidney Transplant Recipients**

C. R. Dorr[1], B. Guo[2], B. Wu[2], J. Abrahante[2], D. Schladt[3], R. Remmel[2], W. Guan[2], A. Muthusamy[3], G. Onyeaghala[3], N. Pankratz[2], A. Matas[2], R. Mannon[4], W. Oetting[2], P. Jacobson[2], A. K. Israni[3], [1]Hennepin Healthcare Research Institute, Minneapolis, MN, USA, [2]University of Minnesota, Minneapolis, MN, USA, [3]Nephrology, Hennepin Healthcare Research Institute, Minneapolis, MN, USA, [4]University of Nebraska Medical Center, Omaha, NE, USA

11:20 am **Role of Ferroptosis Inhibitors in Mitigating Ischemia-Reperfusion Injury in Marginal Livers Using a Novel Protect Model**

M. D. Nazzal, J. Van Nispen, A. Armstrong, V. Murali, E. Song, M. Voigt, A. Samaddar, E. Madsen, C. Manithody, J. Krebs, D. Blackall, D. Carpenter, C. Varma, J. Teckman, A. Jain, Saint Louis University, Saint Louis, MO, USA

11:30 am **Live Video Question and Answer**

Awards

11:50 am - 12:00 pm

ATC's Peoples Choice Award

Moderators: Maryl Johnson, MD, Univ of Wisconsin-Madison, Madison, WI, USA, Linda Cendales, MD, Duke University Medical Center, Durham, NC, USA

Sponsor Networking

12:00 pm - 12:30 pm

This symposium are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Takeda - CMV Infection Scientific Connection

State-of-the-Art

12:30 pm - 1:00 pm

Paul I. Terasaki State of the Art Lecture; Sponsored by the Paul I. Terasaki Research Fund

12:35 pm **Inclusive Excellence in Biomedical Research: Applying Genomics To Unravel Health Disparities In Organ Transplantation**
Hannah Valantine, MD, Stanford University School of Medicine, Stanford, CA, USA

1:00 pm **Break**

Sponsored Satellite Symposia

1:30 pm - 2:30 pm

These symposia are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Comprehensive Testing, Comprehensive Care: Renal Genetic Testing in Kidney Transplantation

Supported by Natera

Blazing the Pathway of Precision Medicine in Liver Transplantation

Supported by Eurofins Transplant Diagnostics

Clinical Applications for MMDx®: Gene Expression Profiling in Transplant Biopsies

Supported by One Lambda, Inc., A Thermo Fisher Scientific Brand

IMPACT Sessions

Kidney

3:00 pm - 4:00 pm

Recurrent Glomerulonephritis in Transplant and the Role of Ancillary Tools in Diagnosis and Prognosis

Moderators: Fernando Cosio, MD, Mayo Clinic, Moderator, Rochester, MN, USA, Lynn Cornell, MD, Mayo Clinic, Professor of Laboratory Medicine and Pathology, Rochester, MN, USA

3:00 pm **Recurrent AL-amyloidosis in the Transplant**
Andrew Bentall, MD, Mayo Clinic, Transplant Nephrologist, Rochester, MN, USA

3:10 pm **The Role of Genetic Evaluation in the Management of Patients with a Diagnosis of Focal Segmental Glomerulosclerosis**
Mireille EL Ters, MD, Mayo Clinic, MD, Rochester, MN, USA

3:20 pm **Clinical Findings, Pathology, and Outcomes of C3GN After Kidney Transplantation**
Ladan Zand, Mayo Clinic Rochester, Rochester, MN, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Kidney
3:00 pm - 4:00 pm

Should We Abolish Cardiac Screening for Asymptomatic Kidney Transplant Candidates?

Moderators: G V Ramesh Prasad, MBBS PhD FRCPC, St. Michael's Hospital, University of Toronto, Professor of Medicine, Toronto, ON, Canada

3:00 pm **The Burden of Cardiovascular Disease among Potential Kidney Transplant Candidates**
Krista Lentine, MD,PhD, Saint Louis University Medical Center, Professor, Saint Louis, MO, USA

3:10 pm **Pro: The Argument FOR Abolishing Cardiac Screening of Asymptomatic Kidney Transplant Candidates**
Adnan Sharif, MD, University Hospitals Birmingham, Dr, Birmingham, United Kingdom

3:20 pm **Con: The Argument AGAINST Abolishing Cardiac Screening of Asymptomatic Kidney Transplant Candidates**
James Rice, MD, Scripps Center for Organ Transplantation, Medical Dir,, Kidney and Pancreas Transplant, La Jolla, CA, USA

3:30 pm **Live Video Rebuttal, Question and Answer**

IMPACT Sessions

Liver
3:00 pm - 4:00 pm

Rising Stars Surgeon Scientists

Moderators: Roberto Hernandez-Alejandro, MD, University of Rochester Medical Center, Profesor of Surgery, Chief Division of Transplantation, Rochester, NY, USA, John Fung, MD, PhD, University of Chicago, Professor of Surgery, Chicago, IL, USA

3:00 pm **Basic/Translational Research in LTx**
Burcin Ekser, MD, Indiana University - Transplant Section

3:10 pm **Expanding Recipient Pool with Transplant Oncology**
Koji Tomiyama, MD, PhD, University of Rochester Medical Center, Assistant Professor, Rochester, NY, USA

3:20 pm **Translational Research in Liver Transplantation**
Varvara Kirchner, MD, University of Minnesota, Assistant Professor of Surgery, Division of Transplantation, Minneapolis, MN, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Other
3:00 pm - 4:00 pm

Utilizing Genomic and Omics for Discovery and Application in Solid-organ Transplantation

Moderators: Loren Gragert, PhD, Tulane University School of Medicine, Assistant Professor, New Orleans, LA, USA, Ajay Israni, Md, MS, Hennepin Healthcare and Univ of Minnesota, Professor of Medicine, Minneapolis, MN, USA

3:00 pm **Multi-Omic approaches in Transplantation**
Brian Piening, PhD, Earle A. Chiles Research Institute, Providence, Assistant Member, Portland, OR, USA

3:10 pm **The International Genetics & Translational Research in Transplantation Network (iGeneTRAiN)**
Brendan Keating, PhD, University of Pennsylvania, Associate Professor of Transplant Research, Philadelphia, PA, USA

3:20 pm **Leveraging Genome-wide Data from Millions of Patients Linked to Medical Records**
David Crosslin, PhD, University of Washington

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Small Bowel
3:00 pm - 4:00 pm

Surgical Management Before and After Intestine Transplant – Timing is Everything

Moderators: Shunji Nagai, MD, PhD, Henry Ford Hospital, MD, PhD, Detroit, MI, USA, Robert Venick, MD, Mattel Children's Hospital At UCLA, Professor of Pediatrics and Surgery, UCLA, Los Angeles, CA, USA

3:00 pm **Management of Entero-cutaneous Fistulae and the Complex Surgical Abdomen - Before or During Transplant?**
Richard Mangus, MD, MS, FACS, Indiana University, Professor of Surgery, Indianapolis, IN, USA

3:10 pm **Stoma vs no Stoma and Timing of Ostomy take Down**
Kishore Iyer, FACS, MBBS, FRCS, Mount Sinai Hospital, Professor of Surgery & Pediatrics, New York, NY, USA

3:20 pm **As the Graft Gradually Fails, when Should Enterectomy be Performed?**
Tomoaki Kato, MD, MBA, Columbia University - College of Physicians & Surgeons, Professor of Surgery, New York, NY, USA

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Pancreas: Kidney
3:00 pm - 4:00 pm

Pancreas After Kidney Transplantation: Unlocking The Survival Advantage

Moderators: Ty Dunn, MD MS, UPenn, Professor of Surgery, Philadelphia, PA, USA, Matthew Cooper, MD, MedStar Georgetown Transplant Institute, Director, Kidney and Pancreas Transplantation, Washington, DC, USA

3:00 pm **New PAK Data Opens Up Opportunities**
Silke Niederhaus, Maryland

3:10 pm **Getting Facile at PAK**
Jonathan Fridell, MD, Indiana University School of Medicine, Chief, Abdominal Transplant Surgery, Indianapolis, IN, USA

3:20 pm **Navigating All the Options for Uremic Diabetic Patients**
Jon Odorico, Wisconsin

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

Basic
3:00 pm - 4:00 pm

Checkpoints for B cells and Antibody Production

Moderators: Anita Chong, PhD, University of Chicago, Professor, Chicago, IL, USA, Jean Kwun, PhD, Duke University, Assistant Professor, Durham, NC, USA

3:00 pm **Regulation of Plasma Cell Differentiation**
Jeremy Boss, PhD, Emory University, Professor and Chair, Atlanta, GA, USA

3:10 pm **Live Video Question and Answer**

IMPACT Sessions

Translational
3:00 pm - 4:00 pm

Perspectives in Progress in Clinical Transplant Research: What have We Learned, Where are we Going?

Moderators: Sandy Feng, MD PhD, UCSF, Professor of Surgery, San Francisco, CA, USA, Allan Kirk, MD, PhD, Duke University Medical Center, Chair, Surgery, Durham, NC, USA

3:00 pm **Perspective from NIH/CTOT**
Nancy Bridges, MD, NIAID, Chief, Transplantation Branch; Senior Scientific Officer, Rockville, MD, USA

3:10 pm **Perspective from the Immune Tolerance Network**
Gerald Nepom, MD, PhD, Immune Tolerance Network, Director, Seattle, WA, USA

3:20 pm **Canadian Transplant Research Perspective**
Lori West, MD, D.Phil, University of Alberta, Professor, Edmonton, AB, Canada

3:30 pm **Live Video Question and Answer**

IMPACT Sessions

HLA
3:00 pm - 4:00 pm

New Insights and Controversies in HLA Testing: HLA Epitope Matching a Pro and Con Debate

Moderators: Howard Gebel, PhD, Emory University Hospital, Professor of Pathology, Atlanta, GA, USA, Katherine Twombley, MD, Medical University of South Carolina, Professor, Charleston, SC, USA

3:00 pm **New Insights and Controversies in HLA Testing: Pro and Con Debate -Setting the Stage**
Katherine Twombley, MD, Medical University of South Carolina, Professor of Pediatrics, Charleston, SC, USA

3:10 pm **Pro: Why Wait: We Should be Doing Epitope Matching Now**
Peter Nickerson, MD, University of Manitoba, Distinguished Professor, Vice Dean (Research), Winnipeg, MB, Canada

3:20 pm **Con: Stop in the Name of HLA: We are Not Ready for Epitope Matching**
Tom Blydt-Hansen, MDCM, FRCPC, University of British Columbia, Medical Director, Pediatric Transplantation, Vancouver, BC, Canada

3:30 pm **Live Video Rebuttal and Question and Answer**

IMPACT Sessions

Pediatric: Liver
3:00 pm - 4:00 pm

Mandatory Splitting of an Adult Liver Offer: Help a Child – Disadvantage an Adult?

Moderators: Walter Andrews, MD, University of Missouri Kansas City, Professor of Pediatric Surgery, Kansas City, MO, USA, Srinath Chinnakotla, MD, University of Minnesota, Surgical Director, Liver Transplantation, Minneapolis, MN, USA

3:00 pm **Overview: Review of Split Liver Transplantation**
Jaimie Nathan, MD, Cincinnati Children's Hospital Medical Center, Associate Professor of Surgery and Pediatrics, Cincinnati, OH, USA

3:10 pm **PRO: Split Liver Transplantation Can Help Children and Not Disadvantage an Adult Recipient or Transplant Program.**
Dominique Jan, MD, Montefiore-Albert Einstein College of Medicine, Professor of Surgery, New York, NY, USA

3:20 pm **CON: Split Liver Transplantation May Help a Child but can Disadvantage an Adult Recipient and Transplant Program.**
James Pomposelli, University of Colorado, Denver, CO, USA

3:30 pm **Live Video Rebuttal, Question and Answer**

IMPACT Sessions

COVID-19
3:00 pm - 4:00 pm

Late-Breaking: Factors Contributing to Outcomes of Transplant Patients with COVID-19

Moderators: Jeffrey Edelman, MD, University of Washington, VAMC Seattle, Associate Professor of Medicine, Seaqttle, WA, USA, Graeme Forrest, MBBS, Rush University medical Center, Professor of Medicine, Chicago, IL, USA

3:00 pm **HLA and COVID -19 Outcomes in Kidney Recipients**
Yasir Qazi, MD, Keck Medical Center At USC, Director , Kidney and Pancreas Transplant Fellowship and Outreach, Los Angeles, CA, USA

3:10 pm **Challenges to Decision Making in the Setting of COVID 19 Infections**
Elizabeth Thomas, DO, UT Health San Antonio, Associate Professor of Surgery, San Antonio, TX, USA

3:20 pm **Transplant Outcomes of COVID-Positive Candidates**
Ankit Bharat, Northwestern, Chicago, IL, USA

3:30 pm **Live Video Question and Answer**

Sponsor Networking

4:00 pm - 4:30 pm

This symposium are not part of the ATC official educational program and the sessions and content are not endorsed by ATC.

Takeda - CMV Infection Scientific Connection

Rapid Fire Oral Abstracts

Basic
4:30 pm - 5:30 pm

Biomarkers and Cellular Therapies

Moderators: Caroline Lamarche, MD, MSc, FRCPC, Université de Montréal, Assistant Clinical Professor, Montreal, QC, Canada, Anna Morris, PhD, Emory University, Dr., Atlanta, GA, USA

4:30 pm **Lymphotoxin Beta Receptor Regulates Treg Migration and Suppression by Modulating Draining Lymphatic Structure**
V. Saxena[1], W. Piao[1], L. Li[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

4:35 pm **CD47-Mediated Gli1/Notch1 Signaling is a Key Regulator of Mesenchymal Stem Cell Immunomodulation in Liver Inflammatory Injury**
D. Xu, M. Sheng, Y. Lin, Y. Tian, Y. Zhan, C. Li, A. J. Coito, R. W. Busuttil, D. G. Farmer, J. W. Kupiec-Weglinski, B. Ke, *Surgery, Dumont - UCLA Transplant Center, Los Angeles, CA*

4:40 pm **Double Negative T Cells Mediate Cd39-Dependent Protection in Hepatic Ischemia and Reperfusion Injury**
H. Jin, M. Li, C. Zhang, G. Sun, D. Zhang, *Beijing Key Laboratory of Tolerance Induction and Organ Protection in Transplantation, Beijing Friendship Hospital, Capital Medical University, Beijing, China*

4:45 pm **The Gut Microbiotainduces Local and Systemic Immune Modulation**
V. Saxena, R. Lakhan, J. Iyyathurai, W. Piao, L. Li, T. Zhang, M. W. Shirkey, B. Ma, E. F. Mongodin, J. Bromberg, *U Maryland, Baltimore, MD*

4:50 pm **Single Cell Rna-Sequencing of Urinary Cells and Defining the Immune Landscape of Rejection in Human Kidney Allografts**
T. Muthukumar[1], H. Yang[1], A. Belkadi[2], G. Thareja[2], C. Li[1], C. Snopkowski[1], K. Chen[1], T. Salinas[1], M. Lubetzky[1], J. Lee[1], D. Dadhania[1], K. Suhre[2], M. Suthanthiran[1], *[1]Nephrology, NY Presbyterian- Weill Cornell Medical College, New York, NY, [2]Physiology and Biophysics, Weill Cornell Medicine-Qatar, Doha, Qatar*

4:55 pm **Gm2a: A Novel Regulatory Pathway Controlling Alloimmunity**
K. M. Baecher[1], P. S. Heeger[2], P. Cravedi[2], M. Fribourg[2], M. L. Ford[1], *[1]Department of Surgery, Emory University, Atlanta, GA, [2]Mount Sinai School of Medicine, New York, NY*

5:00 pm **Nanoparticle Mediated Drug Delivery for Lung Transplantation**
P. M. Patel[1], S. Jung[2], C. L. Miller[1], J. M. O[1], T. Costa[1], A. Dehnadi[1], I. Hanekamp[1], X. F. Li[2], L. Jiang[2], H. Ichimura[2], A. Azimzadeh[1], J. C. Madsen[3], R. Abdi[2], *[1]Surgery, Center for Transplantation Sciences, Massachusetts General Hospital/Harvard Medical School, Boston, MA, [2]Medicine, Transplant Research Center, Brigham and Women's Hospital, Boston, MA, [3]Surgery, Center for Transplantation Sciences, Division of Cardiac Surgery, Massachusetts General Hospital/Harvard Medical School, Boston, MA*

5:05 pm **Targeting Calcineurin/nfatc2 Signaling to Restore Pancreatic Beta-cell Function in Islet Transplantation**
C. Darden[1], J. Mattke[1], S. Vasu[1], K. Kumano[1], Y. Liu[1], B. Naziruddin[2], M. C. Lawrence[1], *[1]Baylor University Medical Ctr, Dallas, TX, [2]Baylor University Medical Ctr, Allen, TX*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

All Organs
4:30 pm - 5:30 pm

Disparities in Access and Machine Learning Outcomes in Solid Organ Transplantation

Moderator: Koren Axelrod, CPHQ, CareDx, Sr Business Analyst, Brisbane, CA, USA

4:30 pm **A Fresh Look at Urbanicity and Its Impact on Additions to the Kidney and Liver Transplant Wait Lists**
W. R. Johnson, S. A. Rega, I. D. Feurer, S. J. Karp, *General Surgery, Vanderbilt University Medical Center, Nashville, TN*

4:35 pm **Racial and Sexual Disparities in Solid Organ Transplant Outcomes Since Implementation of the Affordable Care Act Insurance Expansion Across Some States**
H. Mohamed[1], C. Conceicao[2], A. Kumar[1], J. Buggs[3], *[1]Morsani College of Medicine, University of South Florida, Tampa, FL, [2]Honors College, University of South Florida, Tampa, FL, [3]Transplant Surgery, Tampa General Hospital, Tampa, FL*

4:40 pm **The Impact of the Covid-19 Pandemic on Measures of Transplant Activity is Higher in Lower-Income Countries: A Multinational Survey Study**
S. Sandal[1], B. Boyarsky[2], P. Chiang[2], A. Massie[2], D. Segev[2], M. Cantarovich[1], *[1]McGill University, Montreal, QC, Canada, [2]Johns Hopkins University, Baltimore, MD*

4:45 pm **Black Patients with Cirrhosis Have Longer Length of Stay and Higher Mortality When Hospitalized**
A. Thomas[1], D. Simpson[2], D. P. Ladner[2], R. Berkowitz[2], *[1]ACS Clinical Scholar, Chicago, IL, [2]Transplant Surgery, Northwestern University Feinberg School of Medicine, Chicago, IL*

4:50 pm **Prediction of Renal Allograft Tolerance by Machine Learning**
Q. Fu[1], K. Deng[2], H. Yang[1], S. Deng[1], J. F. Markmann[2], *[1]Organ Transplantation Center, Sichuan Provincial People's Hospital, University of Electronic Sciences and Technology of China, Chengdu, China, [2]Center for Transplantation Sciences, MGH, Boston, MA*

4:55 pm **The Role of Pre-transplant Rectal Screening for Azole-resistant Candida Species in Liver Transplant Candidates**
K. K. Patel[1], M. M. Azar[2], A. Koff[3], K. Belfield[4], D. R. Peaper[5], J. Topal[2], M. Malinis[2], *[1]Yale School of Medicine, New Haven, CT, [2]Section of Infectious Diseases, Yale School of Medicine, New Haven, CT, [3]Section of Infectious Diseases, UC Davis, Sacramento, CA, [4]Department of Pharmacy, Yale New Haven Hospital, New Haven, CT, [5]Department of Laboratory Medicine, Yale School of Medicine, New Haven, CT*

5:00 pm **A Machine Learning-Based Predictive Model for Outcome of Covid-19 in Kidney Transplant Recipients**
I. Revuelta[1], F. Santos-Arteaga[2], D. Di Caprio[3], E. Montagud-Marrahi[1], F. Cofan[1], J. Torregrosa[1], M. Bodro[4], A. Moreno[4], P. Ventura-Aguiar[1], D. Cucchiari[1], N. Esforzado[1], G. Piñeiro[1], J. Ugalde-Altamirano[1], J. Campistol[1], A. Alcaraz[5], B. Bayès[1], E. Poch[1], F. Oppenheimer[1], F. Diekmann[1], *[1]Department of Nephrology and Kidney Transplant, Hospital Clinic, Barcelona, Spain, [2]Faculty of Economics and Management, Free University of Bolzano, Bolzano, Italy, [3]Department of Economics and Management, University of Trento, Trento, Italy, [4]Department of Infectious Diseases, Hospital Clinic, Barcelona, Spain, [5]Department of Urology, Hospital Clinic, Barcelona, Spain*

5:05 pm **Improving Policy-constrained Kidney Exchange via Pre-screening**
D. C. McElfresh[1], M. Curry[2], S. Booker[3], M. Stuart[3], D. Stewart[3], R. Leishman[3], T. Sandholm[4], J. Dickerson[2], *[1]Applied Mathematics, University of Maryland, College Park, MD, [2]University of Maryland, College Park, MD, [3]United Network for Organ Sharing, Richmond, VA, [4]Carnegie Mellon University, Pittsburgh, PA*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Kidney
4:30 pm - 5:30 pm

Kidney Antibody Mediated Rejection
Moderator: Sundaram Hariharan, MD, Starzl Transplant Institute, Univ of Pittsburgh Med Center, Professor of Medicine and Surgery, Pittsburgh, PA, USA

4:30 pm **DSA Causes Mild Molecular ABMR-like Changes in Many Biopsies Not Diagnosed as Rejection**
P. F. Halloran[1], K. S. Madill-Thomsen[1], &. the INTERCOMEX Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

4:35 pm **Beyond Microarrays: Insights from Ncounter Transcript Analysis of Routine Archival Kidney Allograft Biopsies**
I. Rosales, K. Tomaszewski, A. Milagros, T. Kawai, R. Smith, R. Colvin, *Massachusetts General Hospital, Boston, MA*

4:40 pm **Transplant Glomerulopathy in the Absence of Donor-specific HLA Antibodies: Risk Factors, Histopathological Features and Graft Outcome**
A. Senev, E. Van Loon, M. Emonds, M. Naesens, *Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium*

4:45 pm **High Donor-Derived Cell-Free DNA Levels Predict Development of De Novo HLA Donor-Specific Antibodies After Kidney Transplantation - Data from the ADMIRAL Study**
G. Gupta[1], T. Alhamad[2], V. Bowers[3], I. Moinuddin[1], S. Ghosh[4], J. Zeng[4], E. Stites[5], A. Pai[6], J. S. Bromberg[7], S. Anand[8], *[1]Virginia Commonwealth University, Richmond, VA, [2]Washington University in St. Louis, St. Louis, MO, [3]Tampa General Hospital, Tampa, FL, [4]CareDx, Brisbane, CA, [5]University of Colorado, Aurora, CO, [6]University of Texas McGovern Medical School, Houston, TX, [7]University of Maryland School of Medicine, Baltimore, MD, [8]Intermountain Medical Center, Murray, UT*

4:50 pm **Novel Mixed Lymphocyte Reaction Monitoring System That Predicts Chronic Antibody- Mediated Rejection in Kidney Transplant Recipients**
N. Iwahara[1], K. Hotta[1], T. Tanabe[1], D. Iwami[2], Y. Takada[3], H. Higuchi[1], H. Sasaki[3], H. Harada[3], N. Shinohara[1], *[1]Hokkaido Univercity, Sapporo, Japan, [2]Jichi Medical University, Shimotsuke, Japan, [3]Sapporo City General Hospital, Sapporo, Japan*

4:55 pm **The Trifecta Study: Calibrating Circulating Donor-Derived Cell-Free DNA at the Time of Indication Biopsies Against the Molecular Phenotype of the Biopsy Reveals a Prominent Association with NK Cell Genes**
P. Halloran[1], Z. Demko[2], A. Prewett[2], J. Reeve[1], P. Billings[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]Natera Inc., San Carlos, CA*

5:00 pm **Prospective Intensive Monitoring for Anamnestic DSA Responses Allows Near Elimination of Early Clinical AMR**
M. McGowan[1], A. Bickenbach[1], A. R. Shields[2], R. R. Alloway[1], P. Brailey[1], E. Portwood[1], C. Alquist[1], A. Christianson[1], B. Abu Jawdeh[1], M. Cuffy[1], J. Kremer[2], S. Bumb[1], A. Govil[1], M. Anand[1], T. Kaur[1], E. S. Woodle[1], *[1]U Cincinnati, Cincinnati, OH, [2]Christ Hospital, Cincinnati, OH*

5:05 pm **CD56^{dim}CD16^{bright} NK Cells from Kidney Transplant Recipients with Antibody-mediated Rejection Display Increased Proliferation, Type-1 Activation and Cytotoxic Profile**
E. Bailly[1], C. Macedo[1], K. Louis[1], B. Ramaswami[1], M. Lucas[1], C. Bentlejewski[1], P. Randhawa[1], A. Zeevi[1], C. Lefaucheur[2], D. Metes[1], *[1]Department of Surgery, Thomas E. Starzl Transplantation Institute, Pittsburgh, PA, [2]INSERM UMR-S976. Endothelium, Inflammation & Alloreactivity, Université de Paris, Paris, France*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Kidney
4:30 pm - 5:30 pm

Kidney Psychosocial

Moderators: Wendy Balliet, Ph.D., Medical University of South Carolina, Charleston, SC, USA, Zeeshan Butt, PhD, Northwestern University Feinberg School of Medicine, Associate Professor of Medical Social Sciences, Surgery, and Psychiatry, Chicago, IL, USA

4:30 pm **The Relationship Between Health Literacy and Adverse Outcomes After Kidney Transplantation**
E. Lorenz, T. Petterson, C. Schinstock, W. Sanchez, K. Yost, *Mayo Clinic, Rochester, MN*

4:35 pm **Evolving Trends in Risk Profiles and Outcomes in Older Adults Undergoing Kidney Re-Transplantation**
S. Sandal[1], J. Ahn[2], M. Cantarovich[1], N. Chu[2], D. Segev[2], M. McAdams DeMarco[2], *[1]McGill University, Montreal, QC, Canada, [2]Johns Hopkins University, Baltimore, MD*

4:40 pm **Journey to Transplant: A Pilot Feasibility Trial of a Virtual Counseling Intervention for Patients and Their Social Support Networks to Improve Access to Kidney Transplant**
A. Hart[1], R. Edpuganti[2], H. D'Cunha[2], S. Kurschner[2], W. T. McKinney[1], A. Matas[1], R. Patzer[1], S. Chu[1], M. Bruin[1], M. Partin[1], *[1]Hennepin Healthcare, University of Minnesota, Minneaplis, MN, [2]Hennepin Healthcare Research Institute, Minneaplis, MN*

4:45 pm **Understanding Transplant Decision Making Concerns for African, Caribbean and Black Canadian Patients with End-Stage Kidney Disease**
N. Singh[1], A. Wasim[1], W. Hajjar[1], K. Mohan[1], N. El-Dassouki[1], H. Habbal[1], L. Angarso[1], A. Dychiao[1], S. Macanovic[1], A. D. Waterman[2], I. Mucsi[1], *[1]University Health Network, Toronto, ON, Canada, [2]David Geffen School of Medicine, UCLA, Los Angeles, CA*

4:50 pm **Depressive Symptoms and Listing for Kidney Transplantation**
X. Chen, N. Chu, P. Sharma Basyal, W. Vihokrut, D. Crews, D. Brennan, S. Andrews, T. Vannorsdall, D. Segev, M. McAdams DeMarco, *Johns Hopkins University School of Medicine, Baltimore, MD*

4:55 pm **Multistep Algorithm to Achieve Weight Loss Goal in Advanced Stage Obesity Kidney Transplant Candidates: A Single Center Preliminary Report**
A. Shah, J. Galpern, L. Castaldo, P. Touhy, M. Thomas, A. Aaron, M. Fruscione, L. Dageforde, N. Elias, *Transplant Surgery, Massachusetts General Hospital, Boston, MA*

5:00 pm **Challenges and Stressors of COVID-19 Kidney and Transplant Patients: A Mixed Methods Study**
Y. A. Iraheta[1], A. L. Murillo[2], E. H. Wood[1], S. M. Advani[3], R. Pines[4], A. D. Waterman[1], *[1]UCLA David Geffen School of Medicine, Los Angeles, CA, [2]Terasaki Institute, Los Angeles, CA, [3]National Human Genome Research Institute (NIH), Bethesda, MD, [4]Santa Barbara Cottage Hospital, Santa Barbara, CA*

5:05 pm **Early Transplant Education Increases CKD 3-5 Patients' Knowledge and Informed Decision-Making About Chronic Kidney Disease and Living Donor Kidney Transplant**
A. D. Waterman[1], S. H. Kawakita[2], B. Dub[3], Y. A. Iraheta[1], A. L. Murillo[2], T. Menser[4], B. Mittman[3], *[1]UCLA David Geffen School of Medicine, Los Angeles, CA, [2]Terasaki Institute, Los Angeles, CA, [3]Research and Evaluation, Kaiser Permanente, Pasadena, CA, [4]The Houston Methodist Research Institute, Houston, CA*

5:10 pm **Live Video Question and Answer**

Rapid Fire Oral Abstracts

Liver
4:30 pm - 5:30 pm

Post Liver Transplant Management and Complications

Moderator: Sander Florman, MD, Mount Sinai Medical Center, Director, Recanati/Miller Transplantation Institute, New York, NY, USA

4:30 pm **A Meta-Analysis of Endoscopic Stents in the Treatment of Anastomotic Biliary Strictures After Liver Transplantation**
F. Zhou[1], M. Mieth[1], C. Rupp[2], A. Mehrabi[1], A. Nickkholgh[1], *[1]Department of General, Abdominal and Transplant Surgery, University of Heidelberg, Heidelberg, Germany, [2]Department of Internal Medicine, University of Heidelberg, Heidelberg, Germany*

4:35 pm **Effect of Early Biopsy-Proven Rejection on Liver Transplant Outcomes**
D. D. Aufhauser, N. Marka, L. Stalter, G. Levenson, D. Al-Adra, D. P. Foley, *Surgery, University of Wisconsin, Madison, WI*

4:40 pm **The Predictive Factors of Survival in Re-listed Patients Who Received Initial Liver Transplants Using Donation After Circulatory Death Grafts**
Y. Fouda, A. Moro, J. Mcvey, D. Firl, M. Fujiki, D. Teresa, F. Aucejo, C. Quintini, C. H. Kwon, K. Hashimoto, B. Eghtesad, K. Narayanan Menon, C. Miller, K. Sasaki, *Cleveland Clinic, Cleveland, OH*

4:45 pm **Molecular Assessment of Fibrosis and Steatohepatitis in the INTERLIVER Study**
K. S. Madill-Thomsen[1], P. F. Halloran[1], &. the INTERLIVER Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

4:50 pm **Predictive Index for Liver Retransplantation**
C. Christmann, G. Handing, M. McDonald, A. Anand, S. Keeling, N. T. Galván, R. Cotton, C. O'Mahony, J. Goss, A. Rana, *Baylor College of Medicine, Houston, TX*

4:55 pm **Is There a Role for Donor-Specific Antibody Testing in Simultaneous Liver-Kidney Transplantation? A Single Center Analysis of Outcomes**
A. Das, A. Barbetta, D. Remulla, C. Goldbeck, T. Maw, J. Kim, *University of Southern California, Los Angeles, CA*

5:00 pm **High and Low Frequency Domino Liver Transplantation Centers Demonstrate Similar Outcomes**
J. Panichella, H. Resweber, H. Curtis, K. Nguyen, A. Di Carlo, S. Karhadkar, *Temple University School of Medicine, Philadelphia, PA*

5:05 pm **Nutritional Inadequacy is an Independent Predictor of Sepsis Post-liver Transplantation**
J. V. Nolte Fong, M. Elshawwaf, L. W. Moore, E. A. Graviss, D. T. Nguyen, R. Angell, A. Uosef, T. Hirase, C. M. Mobley, R. Ghobrial, *Houston Methodist Hospital, Houston, TX*

5:10 pm **Live Video Question and Answer**

Welcome
8:45 am – 9:00 am

IMPACT Sessions
Small Bowel
9:00 am - 10:00 am

When is Multivisceral Transplant Indicated and When can it be Avoided
Moderators: Rodrigo Vianna, MD, University of Miami/Jackson Memorial Hospital, Director of Transplant Services, Miami, FL, USA, Jang Moon, MD, Mount Sinai Medical Center, Associate Professor of Surgery, New York, NY, USA

9:00 am **Extensive Porto-Mesenteric Thrombosis: Isolated Intestine Transplant or MVT?**
Alan Langnas, DO, University of Nebraska Medical Center, Omaha, NE, USA

9:10 am **The Patient with Pre-Transplant High DSA Titers - Is There a Role for MVT to Manage Immunogenicity?**
Debra Sudan, MD, Duke University Medical Center, Professor of Surgery, Durham, NC, USA

9:20 am **Multivisceral Transplant: Is it ever Necessary for Patients with well Compensated Cirrhosis and Hepatic Fibrosis?**
Kareem Abu-Elmagd, MD, PhD, Cleveland Clinic, Prof., Cleveland, OH, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Lung: Liver
9:00 am - 10:00 am

Lung and Liver Transplant in the Era of CFTR Modulator Therapies
Moderators: Josh Levitsky, MD, MS, northwestern, Professor of Medicine, Chicago, IL, USA, Maryam Valapour, MD, MPP, Cleveland Clinic

9:00 am **Dual-Organ Transplant - How Does Improving Pulmonary Function Impact Liver-Lung Transplant?**
Lindsay King, MD, MPH, Duke, Assistant Professor of Medicine, Durham, NC, USA

9:10 am **How Can CFTR Modulators Affect Referral to Lung Transplant and Be Used Post Transplant?**
Joseph Pilewski, MD, University of Pittsburgh

9:20 am **Considerations of CFTR Modulators and Transplant Medications**
Sara Strout, PharmD, Johns Hopkins Hospital, Cardiothoracic Transplant Clinical Pharmacist, Baltimore, MD, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions
Pancreas
9:00 am - 10:00 am

Broader Distribution of Pancreata Should Require Fewer Pancreas Transplant Programs
Moderators: Jose Oberholzer, MD, University of Illinois at Chicago, Director, Transplant Center, Charlottesville, VA, USA, Dixon Kaufman, MD, PhD, University of Wisconsin, Ray D. Owen Professor, Madison, WI, USA

9:00 am **A Debate Around Broader Distribution of Pancreata and Fewer Pancreas Transplant Programs**
Matthew Cooper, MD, MedStar Georgetown Transplant Institute, Director, Kidney and Pancreas Transplantation, Washington, DC, USA

9:10 am **Pro: Less Programs, Greater Resources, Greater Commitment, Better Patient Service**
Ty Dunn, MD, Univ. of Pennsylvania, Professor of Surgery, Philadelphia, PA, USA

9:20 am **Con: Less Programs, Less Options, Less Access, Poorer Patient Service**
Christian Kuhr, MD, Virgina Mason Medical Center, Surgical Director of Kidney/Pancreas Transplantation, Seattle, WA, USA

9:30 am **Live Video Rebuttal and Question and Answer**

IMPACT Sessions

Pediatric: Kidney
9:00 am - 10:00 am

Biomarkers of Immune Status after Pediatric Kidney Transplantation - the Yin/Yang of Rejection Versus Infection

Moderators: Katherine Twombley, MD, Medical University of South Carolina, Professor, Charleston, SC, USA, Joshua Blatter, MD, MPH, Washington University School of Medicine in St. Louis, Assistant Professor, Saint Louis, MO, USA

9:00 am **Urinary Biomarker Profiles in Children**
Brendan Keating, D.Phil, Univesity of Pennsylvania, Associate Professor of Transplant Research, Philadelphia, PA, USA

9:10 am **The Blood Gene Expression Profile - Are Children Different?**
Sarah Kizilbash, MD, MS, University of MInnesota, Assistant Professor, Minneapolis, MN, USA

9:20 am **Putting the Biomarkers Together - A Panel Approach**
Vikas Dharnidharka, MD, MPH, Washington University in St. Louis, Professor and Vice-Chair, Pediatrics, St. Louis, MO, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Basic
9:00 am - 10:00 am

Non-HLA Antibodies and Graft Rejection

Moderators: Mélanie Dieudé, PhD, Université de Montréal, Professor, Montréal, QC, Canada, Stanley Jordan, MD, Cedars Sinai Medical Ctr, Director Nephrology & Transplant Immunology Medical Director Kidney Transplant Program, West Hollywood, CA, USA

9:10 am **Clinical Relevance of Non-HLA Antibodies**
Dany Anglicheau, MD PhD, Department of Nephrolgy and Transplantation, Necker Hospital, Paris, France, Professor, Paris, France

9:20 am **Functional Properties of Non-HLA Antibodies**
Marie-Josee Hebert, MD, CHUM - Hospital Notre-Dame, Montreal, QC, Canada

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Translational
9:00 am - 10:00 am

Novel Imaging Techniques for Allorejection

Moderators: Geoffrey Camirand, PhD, University of Pittsburgh, Assistant Professor, Pittsburgh, PA, USA, Jonathan Bromberg, MD, PhD, University of Maryland School of Medicine, Professor of Surgery and Microbiology and Immunology, Baltimore, MD, USA

9:00 am **Live Imaging of T Cells and Rejection**
Martin Oberbarnscheidt, University of Pittsburgh, Pittsburgh, PA, USA

9:10 am **Quantifying in Situ Adaptive Immune Cell Cognate Interactions in Humans**
Marcus Clark, M.D., University of Chicago, Professor, Chicago, IL, USA

9:20 am **Live Video Question and Answer**

IMPACT Sessions

Other
9:00 am - 10:00 am

The Hidden Threat of Pulmonary Hypertension in Solid Organ Transplant Patients

Moderators: Helen Te, MD, Univ of Chicago Medicine, Professor of Medicine, Chicago, IL, USA, Salvatore Costa, MD, FACC, Dartmouth Hitchcock Medical Center, Associate Professor of Medicine, Hanover, NH, USA

9:00 am **Pulmonary Hypertension in the Transplant Candidate and Recipient: Diagnostic Challenges**
Deborah Levine, MD, UT San Antonio, Professor of Medicine, San Antonio, TX, USA

9:10 am **Pathophysiology of Pulmonary Hypertension in the Transplant Candidate: Understanding an Under-recognized Condition in Kidney, Liver and Lung transplant Candidates**
James Runo, MD, University of Wisconsin

9:20 am **Live Video Question and Answer**

IMPACT Sessions

Small Bowel
9:00 am - 10:00 am

Intestine Transplant: Strategies to Manage Disease Recurrence and Failure to Thrive

Moderators: Thiago Beduschi, MD, University of Florida, Chief of Transplantation and Hepatobiliary Surgery, Gainesville, FL, USA, Simon Horslen, MB, ChB, Seattle Childrens Hospital, Medical Director of Solid Organ Transplantation, Seattle, WA, USA

9:00 am **Metabolic and Renal Complications Post-Transplant**
Maria Cristina Segovia, MD, Duke University Hospital, Medical Director Intestine Transplant Program, Durham, NC, USA

9:10 am **Recurrence of Disease after Transplant: IBD, Thrombosis, Dysmotility**
Syed-Mohammed Jafri, MD, Henry Ford Health System, Doctor, Detroit, MI, USA

9:20 am **Management of Debility, TPN Dependence and Failure to Thrive after Transplant**
Thomas Fishbein, MedStar Georgetown Transplant Institute, Washington, DC, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Admin
9:00 am - 10:00 am

The Role of the US Federal Government in Solid Organ Transplantation

Moderators: Melissa Greenwald, MD, Chicago, IL, USA, Yolanda Becker, MD, University of Chicago, Professor of Surgery, CHICAGO, IL, USA

9:00 am **FDA involvement in Solid Organ Transplantation**
Scott Brubaker, Silver Spring, MD, USA

9:10 am **The Role of the CDC in Transplantation**
Sridhar Basavaraju, MD, CDC, Director-Office of Blood, Organ, and Other Tissue Safety, Atlanta, GA, USA

9:20 am **HRSA and Solid Organ Transplantation**
Marilyn Levi, MD, HRSA/Health Systems Bureau/Division of Transplantation, Physician, Washington, DC, USA

9:30 am **Live Video Question and Answer**

IMPACT Sessions

Women's Health
9:00 am - 10:00 am

Emerging Hot Topics in Pregnancy and Transplant

Moderators: Monika Sarkar, MD, MAS, UCSF, Associate Professor of Medicine, San Francisco, CA, USA, Patricia West-Thielke, PharmD, University of Illinois, Chicago, IL, USA

9:00 am **Pregnancy After Living Liver and Kidney Donation**
Krista Lentine, MD,PhD, Saint Louis University Medical Center, Professor, St. Louis, MO, USA

9:10 am **Immunosuppression Safety in Transplant: The Road Less Traveled**
Lisa Coscia, RN, BSN, CCTC, National Transplantation Pregnancy Regis, Senior Registry Research Coordinator, Philadelphia, PA, USA

9:20 am **Assisted Reproductive Technology After Transplant: Safe and Successful Options in Men and Women**
Kathleen O'Neill, MD, University of Pennsylvania, Assistant Professor, Philadelphia, PA, USA

9:30 am **Live Video Question and Answer**

10:00 am **Break**

Controversies in Transplantation

Public Policy
10:30 am - 11:30 am

Processes to Assure Referral of Patients with End Stage Organ Disease for Transplant Evaluation

Moderators: Matthew Cooper, MD, MedStar Georgetown Transplant Institute, Director, Kidney and Pancreas Transplantation, Washington, DC, USA, Benjamin Hippen, MD, Metrolina Nephrology Associates, PA, Transplant Nephrologist, Charlotte, NC, USA

10:30 am **We Don't Know What We Don't Know: Lack of Access to Kidney Waitlists and Transplantation**
Sumit Mohan, MD, MPH, Columbia University Medical Center

10:40 am **PRO - An Opt Out Referral System for Kidney Transplant Referral is the Solution**
Rachel Patzer, PhD, MPH, Emory University

10:50 am **CON- An Opt Out System for Kidney Transplant Referral will Overwhelm Transplant Programs and Without Significant Financial Support will Harm Patients and Transplantation**
Lloyd Ratner, MD, MPH, Columbia University, Professor of Surgery; Director - Renal & Pancreatic Transplantation, New York, NY, USA

11:00 am **Live Video Question and Answer**

Controversies in Transplantation

Basic: Translational
10:30 am - 11:30 am

Self-tolerance vs. Islet Transplantation

Moderators: Maria-Luisa Alegre, MD PhD, Univ of Chicago, Professor, Chicago, IL, USA, Peter Stock, MD, PhD, Univ of California-San Francisco, Professor of Surgery, San Francisco, CA, USA

10:30 am **Autoimmune Diabetes at the Crossroads - Where Do We Stand for Transplant Based Therapies?**
James Markmann, MD, PhD, Massachusetts General Hospital, Boston, MA, USA

10:40 am **PRO: Regulatory Tcells Are Ready for Prime Time in Autoimmune Diabetes (and Organ Transplantation)**
Ronald Gill, PhD, University of Colorado, Professor of Surgery, Aurora, CO, USA

10:50 am **CON: Islet Cell Therapy (Allogenic or Engineered) Is The Path Forward**
Kevan Herold, MD, Yale School of Medicine, New Haven, CT, USA

11:00 am **Live Video Question and Answer**

What's Hot / What's New

All Topics: All Organs
12:00 pm - 12:45 pm

Virtual Connect Abstract Highlights

12:05 pm **Clinical Abstracts**
Sylvester Black, MD, PhD, Ohio State University, Associate Professor of Surgery, Columbus, OH, USA

12:25 pm **Basic Abstracts**
Leonardo Riella, MD, PhD, Massachusetts General Hospital, Director of Kidney Transplantation, Boston, MA, USA

Plenary Oral Abstracts

All Topics

Plenary 1

1 **Donor Derived Transmissions 2019: Analysis of the OPTN Ad Hoc Disease Transmission Advisory Committee (DTAC)**
L. Danziger-Isakov[1], M. G. Michaels[1], A. Agarwal[1], S. Aslam[1], K. Dunn[1], J. Goldman[1], D. Levine[1], C. Marboe[1], G. Marklin[1], S. Pouch[1], M. Rana[1], R. Razonable[1], H. L. Stevenson[1], H. S. Te[1], A. Woolley[1], E. Ward[2], C. Jett[2], L. Cartwright[2], R. La Hoz[1], *[1]OPTN DTAC, Richmond, VA, [2]UNOS, Richmond, VA*

2 **Combined CD11b/CD40 Blockade is Superior to CD40 Blockade Alone in Prolonging Survival in Pig-to-Nonhuman Primate Renal Xenotransplantation**
D. A. Faber[1], B. Lovasik[1], A. Matar[1], C. Breeden[1], S. Kim[1], A. Adams[2], *[1]Surgery, Emory University School of Medicine, Atlanta, GA, [2]Surgery, University of Minnesota, Minneapolis, MN*

3 **Engineered Human Glomerular Endothelial Cells to Identify Non-hla Antibodies and Decipher Their Pathogenicity After Kidney Transplantation**
B. Lamarthée[1], C. Burger[1], C. Leclaire[1], L. Morin[1], F. Terzi[1], C. Tinel[1], D. Anglicheau[2], *[1]Inserm U1151, Necker-Enfants Malades Institute, PARIS, France, [2]Necker Hospital, AP-HP, Department of Nephrology and Kidney Transplantation, PARIS, France*

4 **Myeloid Foxo1-β-catenin Axis Regulates Hedgehog/Gli1 Signaling and Controls NLRP3-Mediated Innate Immune Responses in Sterile Inflammatory Liver Injury**
D. Xu, C. Li, M. Sheng, Y. Lin, Y. Tian, Y. Zhan, A. J. Coito, R. W. Busuttil, D. G. Farmer, J. W. Kupiec-Weglinski, B. Ke, *Surgery, Dumont - UCLA Transplant Center, Los Angeles, CA*

Live Video Question and Answer

Plenary 2

99 **Trends in Mortality Among Solid Organ Transplant Recipients Hospitalized for Covid-19 During the Course of the Pandemic**
M. R. Heldman, O. S. Kates, R. M. Rakita, E. D. Lease, C. E. Fisher, A. P. Limaye, *University of Washington, Seattle, WA*

100 **Treg Engagement of Lymphotoxin Beta Receptor in Lymphatic Endothelial Cells is Required for Allograft Protection**
V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

101 **DCD Heart Donation: Impact on Organ Yield**
K. Gauntt, B. Carrico, D. Klassen, *United Network for Organ Sharing, Richmond, VA*

102 **Anti-CD8 Immuno-PET for Non-invasive Tracking of Early Graft Rejection in a Non-human Primate Kidney Transplant Model**
K. Bruestle[1], R. Tavare[2], F. Fredriksson[1], E. Duggan[1], F. Huang[1], B. Bhola[1], J. Giurleo[2], R. Foster[2], P. Krueger[2], M. Dobosz[2], D. Ekanayake-Alper[1], H. Sakai[1], B. Piegari[1], J. Castrillion[1], S. M. Coley[1], O. Harari[2], A. Mintz[1], D. Ma[2], A. Griesemer[1], *[1]Columbia University Medical Center, New York City, NY, [2]Regeneron Pharmaceuticals, Inc, New York City, NY*

Live Video Question and Answer

Plenary 3

197 **Overall Survival by Best Overall Response with Tabelecleucel in Patients with Epstein-Barr Virus-Driven Post-Transplant Lymphoproliferative Disease After Solid Organ Transplant**
S. Prockop[1], L. Gamelin[2], R. Dinavahi[2], Y. Sun[2], N. Guzman-Becerra[2], H. Parmar[2], *[1]Memorial Sloan Kettering Cancer Center, New York, NY, [2]Atara Biotherapeutics, South San Francisco, CA*

198 **TIGIT Agonism Improves Immunosuppression of Cd8 T Cells by Ctla-4ig in a Treg Dependent Manner**
C. R. Hartigan, D. Liu, M. L. Ford, *Emory University Transplant Center, Emory University, Atlanta, GA*

199 **Donor-derived Cell-free DNA Distinguishes Acute Rejection from Other Causes of Graft Injury in Liver Transplant Recipients**
J. Levitsky[1], M. Miller[2], R. Sinha[2], E. Bixler[2], A. Al-Turck[2], J. Weems[2], M. Altrich[2], S. Kleiboeker[2], M. Abecassis[3], *[1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]Viracor Eurofins, Lees Summit, MO, [3]University of Arizona College of Medicine Tucson, Tucson, AZ*

200 **Measuring the Impact of Targeting FcRn-Mediated IgG Recycling on Donor-Specific Alloantibodies in a Sensitized NHP Model**
M. Manook[1], W. Flores[2], R. Schmitz[1], Z. Fitch[1], J. Yoon[1], Y. Bae[1], B. I. Shaw[1], M. Harnois[3], S. Permar[3], A. Kirk[1], D. Magnani[2], J. Kwun[1], S. Knechtle[1], *[1]Duke Transplant Center, Duke University Medical Center, Durham, NC, [2]Massbiologics, University of Massachusetts Medical School, Boston, MA, [3]Human Vaccine Institute, Duke University Medical Center, Durham, NC*

Live Video Question and Answer

Plenary 4

297 **Superior Post-transplant Clinical Outcomes Using Portable Normothermic Perfusion and Assessment with the Organ Care System (ocs) Liver System: 1-year Outcomes of the Ocs Liver Protect Randomized Controlled Trial**
J. Markmann[1], M. Abouljoud[2], M. Ghobrial[3], C. Bhati[4], S. Pelletier[5], J. Magliocca[6], T. Pruett[7], A. Lu[8], M. Rizzari[9], S. Ottmann[10], T. Klair[11], C. Eymard[12], G. Roll[13], G. Reyes[14], S. Black[15], S. Florman[16], S. Mirani[17], C. Marsh[18], G. Schnickel[19], M. Kinkhabwala[20], A. Demetris[21], H. Yeh[22], P. Vagefi[23], M. MacConmara[23], *[1]MGH, Boston, MA, [2]Henry Ford, Detroit, MI, [3]Houston Methodist, Houston, TX, [4]Virginia Commonwealth, Richmond, VA, [5]UVA, Charlottesville, VA, [6]Emory, Atlanta, GA, [7]U. Minnesota, Minneapolis, MN, [8]Tampa General, Tampa, FL, [9]Henry Ford, Detriot, MI, [10]Johns Hopkins, Baltimore, MD, [11]University of Texas HSC, San Antonio, TX, [12]University of Tennessee HSC, Memphis, TN, [13]UCSF, San Francisco, CA, [14]U. Washington, Seattle, WA, [15]Ohio State, Columbus, OH, [16]Mt. Sinai, New York, NY, [17]U. Nebraska, Omaha, NE, [18]Scripps Clinic, San Diego, CA, [19]U. San Diego, San Diego, CA, [20]Montefiore, New York, MA, [21]UPMC, Pittsburgh, PA, [22]Massachusetts General Hospital, Boston, MA, [23]UT Southwestern, Dallas, TX*

298 **Novel Discovery of Super-antigen That Mobilize Regulatory Cd8 T Cells Inhibits Donor-specific Antibody and Protects Heart Allografts from Antibody-mediated Rejection**
J. Y. Choi[1], H. Nakagawa[2], Z. Solhjou[1], K. Yatim[1], H. Zhang[3], P. Patel[3], M. Tawfeek Mohammed[3], L. Riella[4], H. Kim[2], H. Cantor[2], J. Azzi[1], *[1]Brigham and Women's Hospital/Harvard Medical School, Boston, MA, [2]Dana Farber Cancer Institute/ Harvard Medical School, Boston, MA, [3]Brigham and Women's Hospital, Boston, MA, [4]Massachusetts General Hospital/ Harvard Medical School, Boston, MA*

299 **Extreme Phenotype Sampling and Next Generation Sequencing to Identify Genetic Variants Associated with Tacrolimus Metabolism in African American Kidney Transplant Recipients**

C. R. Dorr[1], B. Guo[2], B. Wu[2], J. Abrahante[2], D. Schladt[3], R. Remmel[2], W. Guan[2], A. Muthusamy[3], G. Onyeaghala[3], N. Pankratz[2], A. Matas[2], R. Mannon[4], W. Oetting[2], P. Jacobson[2], A. K. Israni[3], *[1]Hennepin Healthcare Research Institute, Minneapolis, MN, [2]University of Minnesota, Minneapolis, MN, [3]Nephrology, Hennepin Healthcare Research Institute, Minneapolis, MN, [4]University of Nebraska Medical Center, Omaha, NE*

300 **Role of Ferroptosis Inhibitors in Mitigating Ischemia-Reperfusion Injury in Marginal Livers Using a Novel Protect Model**

M. D. Nazzal, J. Van Nispen, A. Armstrong, V. Murali, E. Song, M. Voigt, A. Samaddar, E. Madsen, C. Manithody, J. Krebs, D. Blackall, D. Carpenter, C. Varma, J. Teckman, A. Jain, *Saint Louis University, Saint Louis, MO*

Live Video Question and Answer

Biomarkers, Immune Assessment and Clinical Outcomes - II

111 **Development and Validation of a Novel Peripheral Blood Based Gene Signature for Acute Rejection Following Renal Transplantation**
D. Zhang, Y. Wang, X. Hu, *Department of Urology, Beijing Chao-Yang Hospital, Capital Medical University, Beijing, China*

112 **Multiplexed Imaging Mass Cytometry of the Alloimmune Landscape of Rejection in Clinical Liver Transplantation**
J. Emamaullee, N. Ung, C. Man, J. Hoeflich, C. Goldbeck, A. Barbetta, R. Sun, N. Matasci, J. Katz, J. Lee, S. Chopra, L. Sher, S. Asgharzadeh, O. Akbari, Y. Genyk, *University of Southern California, Los Angeles, CA*

113 **Hypothermic Oxygenated Machine Perfusion Protects Against Cholangiocyte and Hepatocyte Injury and Mitigates Inflammation vs Static Cold Storage: Preliminary Results from a Single Center**
G. Panayotova, F. Paterno, M. McCarty, G. Dikdan, S. Simonishvili, Y. Qin, L. Brown, A. Amin, K. E. Lunsford, J. V. Guarrera, *Transplant Surgery, Rutgers NJMS, Newark, NJ*

114 **The Effect of the Affordable Care Act on Insurance Status, Waitlist, and Transplant Outcomes in Liver Transplantation**
B. I. Shaw[1], M. L. Samoylova[1], V. Wang[2], T. Risoli Jr[3], S. Peskoe[3], K. Caddell[3], L. M. McElroy[1], *[1]Surgery, Duke University, Durham, NC, [2]Population Health Sciences, Duke University, Durham, NC, [3]Biostatistics, Duke University, Durham, NC*

115 **Gain of Function Mutations in Latent Membrane Protein 1 of Epstein Barr Virus are Associated with Increased Risk of Post-Transplant Lymphoproliferative Disorder**
O. M. Martinez[1], S. M. Krams[1], M. Robien[2], M. Lapasaran[1], M. Arvedson[1], K. Weinberg[1], S. Boyd[1], B. Armstrong[3], C. Twist[4], D. Gratzinger[1], B. Tan[1], A. Trickey[1], M. Sever[3], M. Brown[2], D. Bernstein[1], C. O. Esquivel[1], *[1]Stanford University Sch of Med, Stanford, CA, [2]NIAID, Rockville, MD, [3]Rho, Durham, NC, [4]Roswell Park, Buffalo, NY*

116 **Clinical and Molecular Profiling Can Help in Predicting the Response to Alemtuzumab Treatment in Kidney Transplant Recipients with Severe or Glucocorticoid-Resistant Acute Rejection**
D. M. Peelen[1], M. van der Zwan[1], M. C. Clahsen-van Groningen[2], D. A. Mustafa[2], C. C. Baan[1], D. A. Hesselink[1], *[1]Internal Medicine - Nephrology & Transplantation, Erasmus MC, Rotterdam, Netherlands, [2]Pathology, Erasmus MC, Rotterdam, Netherlands*

117 **Identification of Distinct Blood Monocyte Phenotypes from Transplant Kidney Recipients Undergoing Cellular (TCMR) and Mixed Antibody Mediated Rejection (ABMR)**
C. Macedo, E. Bailly, K. Louis, M. Lucas, A. Zeevi, P. Randhawa, D. Metes, *Starzl Transplantation Institute, Pittsburgh, PA*

118 **Validation of a Novel Gene Expression Biomarker of Rejection Following Liver Transplantation**
J. Levitsky[1], M. Kandpal[1], T. Whisenant[2], K. Guo[1], S. Kurian[3], M. Abecassis[4], *[1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]University of California San Diego, San Diego, CA, [3]Scripps Clinic, La Jolla, CA, [4]University of Arizona College of Medicine Tucson, Tucson, AZ*

Live Video Question and Answer

Biomarkers, Immune Assessment and Clinical Outcomes - III

217 **Use of a Novel Bead-based Assay to Measure the Impact of Imlifidase on ABO IgG Antibodies**

A. Halpin[1], B. Motyka[2], T. Ellis[2], J. Pearcey[2], T. L. Lowary[3], A. Runström[4], L. Winstedt[4], R. Bockermann[4], S. Järnum[4], A. Robertson[4], L. J. West[5], *[1]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta and Alberta Precision Laboratories, Edmonton, AB, Canada, [2]Department of Pediatrics, University of Alberta, Edmonton, AB, Canada, [3]Department of Chemistry, University of Alberta, Edmonton, AB, Canada, [4]Hansa Biopharma, Lund, Sweden, [5]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta, Edmonton, AB, Canada*

218 **High Levels of Donor-Derived Cell-Free DNA Predict EGFR Decline After Kidney Transplantation**

T. Alhamad[1], V. Bowers[2], E. Stites[3], S. Anand[4], J. S. Bromberg[5], H. Murad[1], G. Gupta[6], I. Moinuddin[6], L. Bu[7], S. Ghosh[8], J. Zeng[8], A. Pai[9], *[1]Washington University in St. Louis, St. Louis, MO, [2]Tampa General Hospital, Tampa, FL, [3]University of Colorado, Aurora, CO, [4]Intermountain Medical Center, Murray, UT, [5]University of Maryland School of Medicine, Baltimore, MD, [6]Virginia Commonwealth University, Richmond, VA, [7]University of Minnesota, Minneapolis, MN, [8]CareDx, Brisbane, CA, [9]University of Texas McGovern Medical School, Houston, TX*

219 **Assessment of Donor-Derived Cell-Free DNA Performance Characteristics Across the Spectrum of TCMR and ABMR After Kidney Transplant**

L. Bu[1], S. Anand[2], A. Pai[3], J. S. Bromberg[4], T. Alhamad[5], V. Bowers[6], I. Moinuddin[7], S. Ghosh[8], W. Tian[8], E. Stites[9], G. Gupta[7], *[1]University of Minnesota, Minneapolis, MN, [2]Intermountain Medical Center, Murray, UT, [3]University of Texas McGovern Medical School, Houston, TX, [4]University of Maryland School of Medicine, Baltimore, MD, [5]Washington University in St. Louis, St. Louis, MO, [6]Tampa General Hospital, Tampa, FL, [7]Virginia Commonwealth University, Richmond, VA, [8]CareDx, Brisbane, CA, [9]University of Colorado, Aurora, CO*

220 **Intrarenal B-cell Activating Factor (BAFF) Levels are Increased in Transplant Glomerulopathy**

S. Panzer, K. Swanson, G. Pandya, L. Hidalgo, S. Reese, *University of Wisconsin Madison, Madison, WI*

221 **Utility of Non-Invasive Rejection Biomarkers to Guide Immunomodulation in Kidney Transplant Patients with Active Covid-19 Infection**

J. Christensen, G. Gupta, A. Bryson, S. Paluri, R. Thompson, S. Sterling, N. Vissichelli, P. Kimball, D. Kumar, *VCUHealth, Richmond, VA*

222 **The Role of Donor-derived Cell-free DNA to Detect Subclinical Acute Rejection in Kidney Allograft**

S. Park[1], K. Guo[2], R. Heilman[3], E. Poggio[4], D. Taber[5], C. Marsh[6], S. Kurian[7], S. Kleiboeker[8], J. Weems[9], J. Holman[10], L. Zhao[2], R. Sinha[8], S. Brietigam[2], C. Rebello[2], M. Abecassis[11], J. Friedewald[1], *[1]Transplant nephrology, Northwestern University, Chicago, IL, [2]Feinberg School of Medicine, Northwestern University, Chicago, IL, [3]Transplant nephrology, Mayo Clinic College of Medicine and Science, Phoenix, AZ, [4]Department of Nephrology and Hypertension, Cleveland Clinic, Cleveland, OH, [5]Division of Transplant Surgery, Medical University of South Carolina, Charleston, SC, [6]Department of Medicine and Surgery, Scripps Clinic and Green Hospital, La Jolla, CA, [7]Scripps Health, La Jolla, CA, [8]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [9]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [10]Transplant Genomics, Inc, Mansfield, MA, [11]University of Arizona College of Medicine, Northwestern University, Tucson, AZ*

223 **MDR-101-MLK-MERCURY Kidney Transplant Tolerance Study Update**

D. Kaufman[1], S. Akkina[2], M. Stegall[3], J. Piper[4], A. O. Gaber[5], E. Marin[6], S. Busque[7], D. Alonso[8], M. De Vera[9], A. Shah[10], A. Patel[11], K. Chavin[12], M. Laftavi[13], S. Collette[14], E. Stites[15], M. Mai[16], M. Cooper[17], D. Brennan[18], *[1]Surgery, UW, Madison, WI, [2]Surgery, Loyola, Chicago, IL, [3]Surgery, Mayo, Rochester, MN, [4]Surgery, Inova, Fairfax, VA, [5]Surgery, Houston Methodist, Houston, TX, [6]Nephrology, Yale, New Haven, CT, [7]Surgery, Stanford, San Francisco, CA, [8]Surgery, Intermountain, Murray, UT, [9]Surgery, Loma Linda, Loma Linda, CA, [10]Surgery, TJU, Philadelphia, PA, [11]Nephrology, St. Barnabas, Livingston, NJ, [12]Surgery, UHH, Cincinnati, OH, [13]Surgery, Upstate, Syracuse, NY, [14]Surgery, CIUSSS, Montreal, ON, Canada, [15]Nephrology, UC Denver, Denver, CO, [16]Nephrology, Mayo - FL, Jacksonville, FL, [17]Surgery, Georgetown, Washington, DC, [18]Medeor, San Francisco, CA*

224 **Kidney Transplant Rejection Can Be Diagnosed or Even Predicted by Tracking Donor Reactive T Cell Clones in Post-transplant Samples**

Y. Sambandam[1], M. Kandpal[1], J. He[1], X. Huang[1], T. S. Taylor[1], A. A. Shetty[2], J. M. Mathew[1], J. R. Leventhal[1], *[1]Surgery-Comprehensive Transplant Center, Northwestern University Feinberg School of Medicine, Chicago, IL, [2]Medicine, Nephrology Division, Northwestern University Feinberg School of Medicine, Chicago, IL*

Live Video Question and Answer

Ischemia Reperfusion & Organ Rehabilitation

350 **Beneficial Effects of Argon Inhalation on Reducing Lung Ischemia-reperfusion Injury in Miniature Swine**

H. Sahara, *Div. Organ Replacement and Xeno Tx, Center for Advanced Biomedical Science and Swine Research, Kagoshima University, Kagoshima, Japan*

351 **Eosinophils Attenuate Hepatic Ischemia Reperfusion Injury in Mice Through St2-Dependent Il-13 Production**

Y. Yang, Y. Wang, M. Wang, J. Jeong, L. Xu, Y. Wen, C. Emontzpohl, W. Dar, C. Ju, *Department of Anesthesiology, McGovern Medical School University of Texas Health Science Center at Houston, Houston, TX*

352 **Neutrophil Extracellular Trap-induced Thrombotic Microangiopathy in Steatotic Mouse Recipients Impacts Liver Transplant Outcomes**

H. Hirao, H. Kojima, K. Kadono, K. J. Dery, D. G. Farmer, F. M. Kaldas, J. W. Kupiec-Weglinski, *UCLA Medical Center, Los Angeles, CA*

353 **Single Cell Analysis of Living Donor Kidneys Reveals Sex-based Diversity in Proximal Tubulargene Expression**

C. M. McEvoy[1], J. M. Szusz[2], S. Clotet-Freixas[1], J. An[2], S. MacParland[2], G. Bader[3], S. Q. Crome[2], A. Konvalinka[1], *[1]Ajmera Transplant Centre, Toronto General Hospital Research Institute, Toronto, ON, Canada, [2]Immunology and Molecular Genetics, University of Toronto, Toronto General Hospital Research Institute, Toronto, ON, Canada, [3]Donnolly Centre for Cellular and Biomolecular Research, University of Toronto, Toronto, ON, Canada*

354 **Hepatocyte SIRT1 Suppresses Atf4-mediated Apoptosis Triggered by Cold Stress in Mouse and Human Liver Transplantation**

K. Kadono[1], H. Hirao[1], H. Kojima[1], K. J. Dery[1], J. Aziz[1], X. Li[2], J. W. Kupiec-Weglinski[1], *[1]Dumont-UCLA Transplant Center, Los Angeles, CA, [2]NIEHS, Durham, NC*

355 **Estrogen Receptor Beta Deletion is Protective in Renal Ischemia Reperfusion Injury in a Renal Specific Manner**

C. S. O'Brien, P. Hernandez, Z. Wang, G. Ge, W. Hancock, M. H. Levine, *Surgery, University of Pennsylvania, Philadelphia, PA*

356 **Cellular Landscape of Steatotic Livers Revealed by Single-nuclei Rna Sequencing**

C. Kuscu[1], C. Kuscu[1], A. Shetty[2], E. Bardhi[3], T. Rousselle[4], J. Eason[1], M. Sraj[5], D. Maluf[6], V. Mas[4], *[1]Surgery, James D Eason Transplant Institute, Memphis, TN, [2]University of Maryland, Institute for Genome Sciences, Baltimore, MD, [3]Program in Transplantation - University of Maryland, Baltimore, MD, [4]Surgery, Division of Surgical Science, Baltimore, MD, [5]Surgery, University of Maryland, Baltimore, MD, [6]Surgery, Program in Transplantation - University of Maryland, Baltimore, MD*

357 **Cross-Circulation for Extracorporeal Liver Support in a Swine Model**

W. K. Wu[1], A. Tumen[1], J. W. Stokes[2], R. Ukita[2], A. E. Hozain[3], C. R. Flynn[2], M. J. Lee[3], J. R. Talackine[2], N. L. Cardwell[2], J. A. Reimer[3], M. Pinezich[3], C. Benson[2], G. Vunjak-Novakovic[3], S. P. Alexopoulos[2], M. Bacchetta[2], *[1]co-first authors, Vanderbilt University Medical Center, Nashville, TN, [2]Vanderbilt University Medical Center, Nashville, TN, [3]Columbia University Medical Center, New York, NY*

Live Video Question and Answer

Lymphocyte Biology and Tolerance

257 **Sequential Analysis of Renal Allograft Rejection at Single Cell Resolution**

T. Shi[1], C. Castro-Rojas[1], A. Burg[1], K. Roskin[1], J. Rush[2], B. Haraldsson[2], A. Shields[3], R. Alloway[3], E. Woodle[3], D. Hildeman[1], *[1]Immunobiology, Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [2]Novartis Pharmaceuticals AG, Basel, Switzerland, [3]University of Cincinnati Medical Center, Cincinnati, OH*

258 **LTβR Engagement Regulates Treg Migration, Stability and Suppressor Function**

V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

259 **CEACAM1 Signaling is Essential to Elicit Tim-3 Inhibitory Regulation in Liver Transplantation**

H. Kojima, H. Hirao, T. Ito, K. Kadono, K. J. Dery, F. M. Kaldas, J. W. Kupiec-Weglinski, *The Dumont-UCLA Transplantation Center, Los Angeles, CA*

260 **Laminins Differentially Regulate Adaptive Alloimmune Responses**

L. Li[1], M. Shirkey[1], W. Piao[1], Y. Xiong[1], V. Saxena[1], T. Zhang[1], J. Iyyathurai[2], R. Lakhan[1], R. Abdi[3], J. Bromberg[1], *[1]Surgery, UMB, Baltimore, MD, [2]CVID, UMB, Baltimore, MD, [3]Harvard University, Boston, MA*

261 **TIGIT Identifies Polyfunctional Donor-Specific CD4+ T Cells Lost After Kidney Transplantation**
A. C. van der List, N. H. Litjens, M. G. Betjes, M. Klepper, *Nephrology and Transplantation, Erasmus MC, Rotterdam, Netherlands*

262 **TOLS are Novel Regulatory TLOs with A B Cell Signature**
I. Rosales[1], Q. Yuan[1], C. Yang[1], P. Russell[1], J. Madsen[1], A. Alessandrini[1], R. Colvin[1], -. AA and RC[2], *[1]Massachusetts General Hospital, Boston, MA, [2]Co-Senior Authors, Boston, MA*

263 **Successful Induction of Hematopoietic Chimerism by Dual Inhibition of Mcl-1 and Bcl-2 Without Myeloablative Treatments in Nonhuman Primates**
T. Hirose, D. Ma, G. Lassiter, T. Kawai, *Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA*

264 **Increased T Cell Cross-dressing in Accepted Kidney Allografts**
Q. Yuan[1], S. Hong[2], E. Szuter[2], I. Rosales[2], Y. Zhao[2], B. Gonzalez-Nolasco[2], G. Benichou[2], P. Russell[2], J. Madsen[2], R. Colvin[2], A. Alessandrini[2], *[1]Massachusetts General Hospital/Chinese PLA General Hospital, Boston, MA, [2]Massachusetts General Hospital, Boston, MA*

Live Video Question and Answer

Rejection, Innate Immunity and Allorecognition

249 **Dna-pkcs Regulation of the Allogeneic Immune Response**
L. Burdine, M. Burdine, Z. Waldrip, D. Harrison, *University of Arkansas, Little Rock, AR*

250 **P40 Homodimers Induce Il-15 to Promote Endogenous Donor-reactive Memory Cd8 T Cell Activation within High-risk Cardiac Allografts**
H. Tsuda, A. Valujskikh, R. Fairchild, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

251 **Contribution of T-bet Expressing CD27+ CD21- Activated Memory B Cells Poised for Plasma Cell Differentiation to Antibody-mediated Rejection of Kidney Transplants**
K. Louis[1], E. Bailly[1], C. Macedo[1], B. Ramaswami[1], X. Gu[1], G. Chalasani[1], A. Zeevi[1], P. Randhawa[1], H. Singh[2], C. Lefaucheur[3], D. Metes[1], *[1]Surgery, University of Pittsburgh, Pittsburgh, PA, [2]Center for Systems immunology, Department of Immunology, University of Pittsburgh, Pittsburgh, PA, [3]Human Immunology and Immunopathology, INSERM U976, Paris, France*

252 **Donor Mhc-independent Islet Rejection in Autoimmune Diabetes: Implications for Stem Cell Therapy**
R. G. Gill[1], M. Coulombe[2], K. S. Beard[1], A. L. Burrack[3], *[1]University of Colorado, Aurora, CO, [2]Surgery, University of Colorado, Aurora, CO, [3]Mircrobiology and Immunology, University of Minnesota, Minneapolis, MN*

253 **Accelerated Bronchiolitis Obliterans After Lung Transplant Promoted by an ATG16L1 Mutation is Coupled to Mitochondrial Damage and Metabolic Alterations in Monocyte-derived Antigen Presenting Cells**
M. Cano[1], D. Zhou[1], D. Kreisel[1], C. Chen[2], K. Pugh[1], D. Byers[1], R. Hachem[1], A. Gelman[1], *[1]Washington University, Saint Louis, MO, [2]UT Southwestern Medical Center, Dallas, TX*

254 **Resolution of Endothelial Inflammation is Delayed Following IFNγ, Which Provokes a Long-lasting Pro-adhesive Phenotype Dependent on JAK/STAT Signaling**
N. M. Valenzuela, *Pathology and Laboratory Medicine, UCLA, Los Angeles, CA*

255 **PD-1/PD-L1 Selectively Regulates Treg Lymphatic Migration**
W. Piao[1], L. Li[1], C. Paluskievicz[1], Y. Zhang[2], V. Saxena[3], K. Hippen[2], B. Blazar[2], L. Riella[4], J. Bromberg[1], *[1]Surgery, U Maryland, Baltimore, MD, [2]U Minnesota, Minneapolis, MN, [3]U Maryland, Baltimore, MD, [4]Harvard U, Boston, MA*

256 **Ikaros-SIRT1 Signaling Axis Regulates Macrophage Polarization and Ischemia Reperfusion Injury in Mouse and Human Liver Transplantation**
K. Kadono[1], H. Hirao[1], H. Kojima[1], K. J. Dery[1], X. Li[2], J. W. Kupiec-Weglinski[1], *[1]The Dumont-UCLA Transplant Center, Los Angeles, CA, [2]NIEHS, Durham, NC*

Live Video Question and Answer

Xenotranplantation and Preclinical Studies

342 **Natural Sensitization by Pregnancy, Testing Desensitization Strategies in Female NHPs Across Repeat Mismatches**
M. Manook, J. Yoon, Z. Fitch, R. Schmitz, A. M. Jackson, J. Kwun, S. Knechtle, *Duke Transplant Center, Duke University Medical Center, Durham, NC*

343 **AT-1501, a Novel and Clinically Applicable CD40L Specific Monoclonal Antibody, Promotes Islet Allograft Survival in Nonhuman Primates**
D. Berman[1], N. Kenyon[1], M. Willman[1], A. Gill[2], S. Perrin[3], C. Ricordi[1], *[1]University of Miami, Miami, FL, [2]ALS Therapy Development Institute, Cambridge, MA, [3]Novus Therapeutics, Irvine, CA*

344 **Interruption of Notch Signaling via Blockade of Delta-Like Ligand 4 Prevents Co-Stimulation Blockade Resistant Allograft Rejection**
A. J. Matar, B. P. Lovasik, Y. Dong, D. A. Faber, J. Habib, C. Breeden, J. Regenold, A. Ghosh, A. Stephenson, W. H. Kitchens, A. B. Adams, *Emory University Department of Surgery, Atlanta, GA*

345 **Belatacept and Carfilzomib-based Treatment of Active Antibody-mediated Rejection in a Sensitized Nonhuman Primate Model**
J. Kwun[1], R. Schmitz[1], M. Manook[1], Z. Fitch[1], D. Olaso[1], A. Choi[1], J. Yoon[1], Y. Bae[1], J. Lambris[2], S. Knechtle[1], *[1]Surgery, Duke University, Durham, NC, [2]Pathology & Laboratory Medicine, University of Pennsylvania, Philadelphia, PA*

346 **Alpha 1-antitrypsin Reduces Cytokine Elaboration in a Xenogeneic Lung Transplantation Model**
L. Burdorf[1], C. Laird[2], T. Zhang[2], M. R. Connolly[1], Z. Habibabady[1], S. Pratts[1], S. Miura[1], F. Pollok[1], W. Eyestone[3], C. J. Phelps[3], D. L. Ayares[3], A. M. Azimzadeh[1], R. N. Pierson III[1], *[1]Surgery, Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA, [2]Surgery, University of Maryland, Baltimore, MD, [3]Revivicor, Blacksburg, VA*

347 **Pig Orthotopic Heart Transplantation (ohtx) in Baboons: Is an Acute Pulmonary Inflammatory Response the Key Problem?**
A. Jagdale[1], D. Cleveland[2], M. Bikhet[1], J. Foote[3], G. Walcott[4], H. Iwase[1], T. Yamamoto[1], H. Hara[1], C. Hansens-Estruch[1], D. Ayares[5], S. Litovsky[6], L. Rhodes[2], W. Carlo[7], J. Crawford[2], R. Dabal[2], S. Borasino[2], D. Cooper[1], *[1]Surgery, University of Alabama at Birmingham, Birmingham, AL, [2]Cardiothoracic Surgery, Children's of Alabama, Birmingham, AL, [3]Medicine and Cardiovascular Diseases, University of Alabama at Birmingham, Birmingham, AL, [4]Medicine, University of Alabama at Birmingham, Birmingham, AL, [5]Surgery, Revivicor, Blacksburg, VA, [6]Pathology, University of Alabama at Birmingham, Birmingham, AL, [7]Division of Pediatric Cardiology, Department of Pediatrics, University of Alabama at Birmingham, Children's of Alabama, Birmingham, AL*

348 **Successful Long-Term TMA- and Rejection-Free Survival of a Kidney Xenograft With Triple Xenoantigen Knockout Plus Insertion of Multiple Human Transgenes**
T. Hirose[1], D. Ma[1], G. Lassiter[1], H. Sasaki[1], I. Rosales[2], T. Coe[1], C. Rickert[1], R. Matheson[1], R. Colvin[2], W. Qin[3], Y. Kan[3], J. Layer[3], K. Stiede[3], K. Hall[3], M. Youd[3], W. Westlin[3], M. Curtis[3], J. F. Markmann[1], T. Kawai[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA, [2]Pathology, Massachusetts General Hospital, Boston, MA, [3]eGenesis Inc, Cambridge, MA*

349 **Impact of Allosensitization on Xenotransplantation**
D. Olaso[1], M. Manook[1], J. Yoon[1], Y. Bae[1], A. Barbas[1], A. Adams[2], S. Knechtle[1], J. Kwun[1], *[1]Department of Surgery, Duke Transplantation Center, Durham, NC, [2]Department of Surgery, University of Minnesota, Minneapolis, MN*

Live Video Question and Answer

COVID-19

Late-Breaking: COVID-19

LB 1 **Safety of Sars-cov-2 Mrna Vaccines in Solid Organ Transplant Recipients**
M. Ou, B. Boyarsky, J. Motter, R. Greenberg, A. Teles, J. Ruddy, M. Krach, W. Werbel, R. Avery, A. Massie, D. Segev, J. Garonzik-Wang, *Johns Hopkins School of Medicine, Baltimore, MD*

LB 2 **A Mechanistic Evaluation to Guide the Optimal Immunosuppression Adjustment Strategy in Transplant Patients with COVID-19**
V. Hall, V. Ferreira, D. Kumar, A. Humar, *UHN, Toronto, ON, Canada*

LB 3 **Monoclonal Antibody Therapy for COVID-19 in Solid Organ Transplant Recipients**
Z. A. Yetmar[1], E. Beam[1], J. C. O'Horo[1], R. Ganesh[2], D. M. Bierle[2], L. Brumble[3], M. T. Seville[4], R. R. Razonable[1], *[1]Infectious Diseases, Mayo Clinic, Rochester, MN, [2]General Internal Medicine, Mayo Clinic, Rochester, MN, [3]Infectious Diseases, Mayo Clinic, Jacksonville, FL, [4]Infectious Diseases, Mayo Clinic, Scottsdale, AZ*

LB 4 **Reduction in Hospitalizations and Deaths in Covid-19 Positive Abdominal Organ Transplant Recipients Following Implementation of A Protocol for Early Treatment with Bamlanivimab**
A. Ahearn, T. Maw, J. Emamaullee, J. Kim, E. Blodget, J. Kahn, C. Goldbeck, L. Sher, Y. Genyk, *Abdominal Transplantation, Keck Medical Center of USC, Los Angeles, CA*

LB 5 **Mortality in Organ Transplant Recipients with Covid-19 Compared to Non-transplant or Waitlisted Patients: A Meta-analysis**
A. H. Lerner, E. Klein, D. Farmakiotis, *Rhode Island Hospital/Brown University, Providence, RI*

LB 6 **Effect of HLA Class II Polymorphism on Predicted Cellular Immunity Against SARS-CoV-2 at the Individual Level and Within Twenty Five Race/ethnic Groups**
H. C. Copley[1], L. Gragert[2], A. R. Leach[3], V. Kosmoliaptsis[1], *[1]Department of Surgery, University of Cambridge, Cambridge, United Kingdom, [2]Department of Pathology, Tulane University School of Medicine, New Orleans, LA, [3]European Bioinformatics Institute (EMBL-EBI), Hinxton, United Kingdom*

LB 7 **Limited Immunogenicity of a Single Dose of Sars-cov-2 Mrna Vaccine in Solid Organ Transplant Recipients**
B. Boyarsky, M. Ou, R. Greenberg, A. Teles, W. Werbel, R. Avery, A. Tobian, A. Massie, D. Segev, J. Garonzik Wang, *Johns Hopkins, Baltimore, MD*

LB 8 **Dd-cfdna Can Guide Safe Reintroduction of Immunosuppression in Kidney Transplant Recipients with Covid-19**
J. Miles[1], J. Leonard[2], V. Tatapudi[2], M. Fei[1], R. Montgomery[2], N. M. Ali[2], *[1]CareDx, Brisbane, CA, [2]Transplant Institute, NYU Langone Health, New York, NY*

Live Video Question and Answer

Heart

Do's and Don'ts of Heart Transplant Care

142 **Pregnancy Outcomes in 108 Heart Transplant Recipients**
L. A. Coscia[1], A. Yusuf[1], S. Rao[2], S. Constantinescu[3], M. J. Moritz[4], *[1]Transplant Pregnancy Registry International, Philadelphia, PA, [2]University of Virginia Heath System, Charlottesville, VA, [3]Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [4]Surgery, Lehigh Valley Health Network, Allentown, PA*

143 **DSA is Associated with Molecular Changes in Many Hearts with Minor Abnormalities but Not Diagnosed as Antibody-Mediated Rejection**
P. Halloran[1], K. S. Madill-Thomsen[1], &. the INTERHEART Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

144 **Quilty Lesions are Associated with a Tolerance Profile in Heart Allografts Biopsies**
J. Torrealba, S. Moore, S. Sathirareuangchai, L. De Las Casas, Q. Cai, *Pathology, UTSW Medical Ctr, Dallas, TX*

145 **The Pathology of Heart Allograft Biopsies: Discrepancies in Interpretation Between Conventional Histology and the Molecular Microscope Diagnostic (MMDx®) System**
P. Randhawa[1], A. Seitz[2], Y. Huang[1], B. Feingold[2], *[1]Department of Pathology, Pittsburgh, PA, [2]Pediatrics, University of Pittsburgh, Pittsburgh, PA*

146 **Impact of Statin Intensity on the Incidence of Vascular Events and Graft Survival in Heart Transplant Recipients**
E. Kim[1], I. Booth[2], R. Madathil[3], B. Ravichandran[1], M. Demehin[2], M. Plazak[2], *[1]University of Maryland School of Pharmacy, Baltimore, MD, [2]Pharmacy, University of Maryland Medical Center, Baltimore, MD, [3]University of Maryland School of Medicine, Baltimore, MD*

147 **Assessing the Impact of Acute Major Adverse Kidney Events on Clinical Outcomes in Heart Transplant Recipients**
J. E. Kelly[1], C. Perez[1], D. Taber[1], R. J. Tedford[2], B. McMahon[2], S. Alzaidi[1], H. B. Meadows[1], *[1]Pharmacy, MUSC Health, Charleston, SC, [2]Medicine, MUSC Health, Charleston, SC*

148 **Acute Kidney Injury Requiring Dialysis in Heart Transplant Recipients is a Risk Factor for Graft Failure and Overall Mortality**
M. A. Merzkani, H. Murad, A. Pottebaum, A. Java, A. Malone, J. Schilling, A. Itoh, R. Delos Santos, T. Alhamad, *Transplant, Washington University, Saint Louis, MO*

149 **Acute Dialysis, Mortality and Renal Failure After Heart Alone Transplant by Egfr and Dialysis Requirement in the United States**
M. Aljuhani[1], T. Alexy[1], S. Jackson[2], C. Martin[1], R. Kandaswamy[3], S. Riad[1], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Complex Care Analytics, Fairview Health Services, Minneapolis, MN, [3]Surgery, University of Minnesota, Minneapolis, MN*

Live Video Question and Answer

Heart: Triple "D" in Heart Transplantation: DCD, Dual-Organ and Declined Hearts

43 **Steroid-free Immunosuppression in Heart-Kidney Transplant Patients: Is It Safe?**
R. Skorka, J. Patel, M. Kittleson, N. Patel, T. Singer-Englar, A. Velleca, B. Azarbal, D. Chang, E. Kransdorf, L. Czer, D. Megna, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

44 **Adult Combined Liver-Heart Transplantation: The United States Experience**

I. A. Ziogas[1], S. P. Alexopoulos[1], W. K. Wu[1], L. K. Matsuoka[1], M. A. Rauf[1], M. Izzy[2], R. Perri[2], K. H. Schlendorf[3], J. N. Menachem[3], A. S. Shah[4], *[1]Division of Hepatobiliary Surgery and Liver Transplantation, Vanderbilt University Medical Center, Nashville, TN, [2]Department of Medicine, Division of Gastroenterology, Hepatology and Nutrition, Vanderbilt University Medical Center, Nashville, TN, [3]Division of Cardiovascular Medicine, Vanderbilt University Medical Center, Nashville, TN, [4]Department of Cardiac Surgery, Vanderbilt University Medical Center, Nashville, TN*

45 **High Degree of Center Variation in Simultaneous Heart Kidney Transplant: Opportunities for Standardization**

B. I. Shaw[1], M. L. Samoylova[1], S. J. Kesseli[1], D. Olaso[2], A. S. Barbas[1], D. L. Sudan[1], L. E. Boulware[3], L. M. McElroy[1], *[1]Surgery, Duke University, Durham, NC, [2]School of Medicine, Duke University, Durham, NC, [3]Medicine-Nephrology, Duke University, Durham, NC*

46 **Allograft Discard Risk Index for Heart Transplantation**

R. M. Reul[1], A. A. Saleem[1], C. N. Keller[1], T. H. Malik[1], J. A. Goss[2], A. A. Rana[2], *[1]Office of Student Affairs, Baylor College of Medicine, Houston, TX, [2]Michael E. DeBakey Department of Surgery, Baylor College of Medicine, Houston, TX*

47 **Waitlist and Post-Transplant Outcomes of Candidates With Lvad: Comparison of Old and New Heart Allocation Policies**

M. Colvin[1], Y. Ahn[2], S. Hall[3], M. Walsh[4], A. Israni[2], *[1]Univ of Michigan, Ann Arbor, MI, [2]SRTR, Minneapolis, MN, [3]Baylor Univ, Dallas, TX, [4]St. Vincent Heart Ctr, Indianapolis, IN*

48 **Liver Biopsy as a Predictor in Risk Stratification for Heart Transplant Candidates**

S. Tolia[1], T. Al Saadi[1], N. Narang[2], A. Joshi[2], C. Sciamanna[2], S. Pauwaa[2], G. Macaluso[2], M. Dia[2], A. Tatooles[3], P. Pappas[3], W. Cotts[2], A. Andrade[2], *[1]Internal Medicine, Advocate Christ Medical Center, Oak Lawn, IL, [2]Cardiology, Advocate Christ Medical Center, Oak Lawn, IL, [3]Cardiovascular Surgery, Advocate Christ Medical Center, Oak Lawn, IL*

49 **Donor Factors Associated with In-field Decline of Heart Allografts**

L. Piechura, F. Yazdchi, M. Harloff, H. Shim, M. Keshk, A. Coppolino, III, D. Rinewalt, H. Mallidi, *Brigham and Women's Hospital, Boston, MA*

50 **Waitlist and Post-Transplant Outcomes of Candidates with Iabp or Ecmo: Comparison of Old and New Heart Allocation Policies**

M. Colvin[1], Y. Ahn[2], S. Hall[3], M. Skeans[2], M. Walsh[4], A. Israni[2], *[1]Univ of Michigan, Ann Arbor, MI, [2]SRTR, Minneapolis, MN, [3]Baylor Univ, Dallas, TX, [4]St. Vincent Heart Ctr, Indianapolis, IN*

Live Video Question and Answer

ID

BK virus in Kidney Recipients

265 **VP2 MRNA Distinguishes the Direct Injury and Inflammation Effects of Polyoma Virus (BK) Infection from the Cognate TCMR Response That Follows Immunosuppressive Minimization**

P. F. Halloran[1], K. Famulski[1], K. S. Madill-Thomsen[1], G. Böhmig[2], G. Gupta[3], M. Myślak[4], O. Viklicky[5], &. the INTERCOMEX Study Group[6], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]Medical University of Vienna, Vienna, Austria, [3]Virginia Commonwealth University, Richmond, VA, [4]Pomeranian Medical University, Szczecin, Poland, [5]Institute for Clinical and Experimental Medicine, Prague, Czech Republic, [6]., Edmonton, AB, Canada*

266 **Coexistence of BKPyV Lytic Infection and Viral Integration in the Development of BKPyV Diseases After Renal Transplantation**

S. Yan[1], Y. Wang[1], Y. Liu[1], W. Deng[1], Z. Yan[1], J. Xu[1], C. Wu[2], Y. Miao[1], *[1]Department of Organ Transplantation, Nanfang Hospital, Southern Medical University, Guangzhou, China, [2]Departments of Urology & Pathology, Massachusetts General Hospital, Harvard Medical School, Boston, MA*

267 **Duration and Magnitude of BK Viremia Do Not Predict Outcome in Patients After Kidney Transplantation**

E. A. Farkash[1], J. T. Rajagopal[2], M. Vincent[2], M. D. Doshi[3], *[1]Dept of Pathology, Michigan Medicine, Ann Arbor, MI, [2]University of Michigan, Ann Arbor, MI, [3]Dept of Nephrology, Michigan Medicine, Ann Arbor, MI*

268 **Donor-Derived Cell-Free DNA Levels Risk-Stratify Polyoma BK Viremia and Associated Clinical Events After Kidney Transplantation - Preliminary Results from ADMIRAL Study**

A. Pai[1], L. Bu[2], J. S. Bromberg[3], G. Gupta[4], I. Moinuddin[4], T. Alhamad[5], V. Bowers[6], S. Ghosh[7], W. Tian[7], E. Stites[8], S. Anand[9], *[1]University of Texas McGovern Medical School, Houston, TX, [2]University of Minnesota, Minneapolis, MN, [3]University of Maryland School of Medicine, Baltimore, MD, [4]Virginia Commonwealth University, Richmond, VA, [5]Washington University in St. Louis, St. Louis, MO, [6]Tampa General Hospital, Tampa, FL, [7]CareDx, Brisbane, CA, [8]University of Colorado, Aurora, CO, [9]Intermountain Medical Center, Murray, UT*

269 **Characterization of Retransplantation Following Graft Failure Due to Bkvn**

K. Nguyen[1], H. Curtis[2], J. Panichella[2], H. Resweber[3], A. Di Carlo[2], S. Karhadkar[1], *[1]Surgery, Temple University School of Medicine, Philadelphia, PA, [2]Surgery, Temple University School of Medicine, Philadephia, PA, [3]Surgery, Temple University School of Medicine, Gladwyne, PA*

270 **Transcriptomics and Proteomics Profiling of Complement Pathway (cp) Proteins in Biopsies With Polyomavirus Bk Nephropathy (bkvn)**

P. Randhawa[1], F. Fei[2], Y. Huang[1], G. Tseng[3], K. Xiao[4], *[1]Departments of Pathology, Pittsburgh, PA, [2]Pharmacology and Chemical Biology, Pittsburgh, PA, [3]Biostatistics, Pittsburgh, PA, [4]Pharmacology and Chemical Biology, University of Pittsburgh, Pittsburgh, PA*

271 **Efficacy of MAU868, a Novel BKV Neutralizing Monoclonal Antibody (mAb), for the Treatment of Severe BK Virus Nephropathy (BKVN) After Kidney Transplant**

S. C. Jordan[1], N. Ammerman[2], M. Toyoda[3], K. Lim[2], J. R. Abend[4], A. Patick[5], M. R. Hodges[5], A. Vo[2], S. J. Kovacs[6], *[1]Comprehensive Transplant Center, Cedars Sinai Medical Ctr, West Hollywood, CA, [2]Comprehensive Transplant Center, Cedars Sinai Medical Ctr, Los Angeles, CA, [3]Cedars Sinai Medical Ctr, Los Angeles, CA, [4]Novartis Institutes for BioMedical Research, Virology Research, Emeryville, CA, [5]Amplyx Pharmaceuticals, San Diego, CA, [6]Novartis Institutes for BioMedical Research, Translational Medicine, East Hanover, NJ*

272 **Immunosuppression Reduction Strategies for Polyoma BK Viremia in Kidney Transplant Patients on Belatacept-Based Immunosuppression**

O. Roe[1], E. Meredith[1], A. Reid[2], A. Basu[3], *[1]Emory University Hospital, Atlanta, GA, [2]University of California San Francisco Medical Center, San Francisco, CA, [3]Emory Transplant Center, Atlanta, GA*

Live Video Question and Answer

COVID-19 Session 1

19 **Solid Organ Transplant Recipient Attitudes Towards a SARS-CoV-2 Vaccine**

M. Ou[1], B. Boyarsky[1], L. Zeiser[1], T. Chiang[1], J. Ruddy[1], S. Rasmussen[1], J. Martin[2], J. Russell[2], C. Durand[1], R. Avery[1], W. Werbel[1], M. Cooper[3], A. Massie[1], D. Segev[1], J. Garonzik-Wang[1], *[1]Johns Hopkins, Baltimore, MD, [2]National Kidney Foundation, New York, NY, [3]Medstar Georgetown Transplant Institute, Washington, DC*

20 **Systematic Screening of Kidney Transplant Patients Points Towards Deficits in Neutralizing Antibody Capacity Against Sars-cov-2**

V. Wijtvliet[1], K. K. Ariën[2], J. Mariën[2], B. Peeters[3], R. Hellemans[4], A. Massart[4], S. Van Hees[1], P. Moons[5], H. Theeten[6], P. Van Damme[6], H. Goossens[7], B. Y. De Winter[1], K. J. Ledeganck[1], D. Abramowicz[4], *[1]Laboratory of Experimental Medicine and Pediatrics, University of Antwerp, Antwerp, Belgium, [2]Department of Biomedical Sciences, Institute of Tropical Medicine and University of Antwerp, Antwerp, Belgium, [3]Department of Laboratory Medicine, Antwerp University Hospital, Antwerp, Belgium, [4]Department of Nephrology and Hypertension, Antwerp University Hospital, Antwerp, Belgium, [5]Biobank, Antwerp University Hospital, Antwerp, Belgium, [6]Centre for the Evaluation of Vaccination, Vaccine and Infectious Disease Institute, University of Antwerp, Antwerp, Belgium, [7]Department of Medical Microbiology, Vaccine & Infectious Disease Institute, University of Antwerp, Antwerp, Belgium*

21 **Clinical Outcomes of Solid Organ Transplant Recipients Treated with Remdesivir and Convalescent Plasma for Covid-19 at the Largest Transplant Center in the United States**

A. Fernandez, S. Anjan, A. Chandorkar, D. de Lima, R. Zamora, L. A. Mendez-Castaner, J. Simkins, J. Camargo, M. Morris, M. Loebe, J. Bauerlein, C. O'Brien, N. Sinha, G. Burke, G. Ciancio, A. Mattiazzi, R. Vianna, L. Abbo, G. Guerra, Y. Natori, *Miami Transplant Institute, Jackson Health System, Miami, FL*

22 **Development and Durability of Sars-cov-2 Antibodies Among Solid Organ Transplant Recipients**

B. Boyarsky, M. Ou, R. Greenberg, M. Krach, R. Wang, T. P. Chiang, W. Werbel, R. Avery, W. Clarke, A. Tobian, A. Massie, D. Segev, J. Garonzik-Wang, *Johns Hopkins, Baltimore, MD*

23 **Polyfunctional T-cell Impairment to Sars-cov-2 Coronavirus in Solid Organ Transplant Recipients with Acute Covid-19 Infection**

A. Favà[1], L. Donadeu[2], V. Pernin[3], M. Meneghini[1], E. Crespo[2], N. Sabé[4], L. Lladó[5], J. Gonzalez-Costello[6], O. Thaunat[7], O. Bestard[1], *[1]Kidney Transplantation Unit, Bellvitge University Hospital- IDIBELL, L'Hospitalet de Llobregat. Barcelona, Spain, [2]Experimental Nephrology Laboratory, IDIBELL, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [3]Kidney Transplant Unit, Hospital de Montpellier, Montpellier, France, [4]Infectious Disease Department, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [6]Heart Transplantation Unit, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [7]Department of Transplantation, Edouard Herriot Hospital Lyon, Lyon, France*

24 **Longitudinal Antibody Response and Viral Loads in Covid-infected Organ Transplant Recipients**

T. M. Marinelli, V. H. Ferreira, M. Ierullo, V. Kulasingham, B. Majchrzak-Kita, C. Rotstein, S. Husain, S. Hosseini, A. Humar, D. Kumar, *UHN, Toronto, ON, Canada*

25 **Attitudes Towards Covid-19 Vaccination in an Inner-city Population of Kidney Transplant Patients (Ktx)**

P. Kerner, A. Imas, G. Udod, L. Gruffi, M. Goldberg, A. Saleh, K. Cruickshank, M. Markell, *SUNY Downstate Health Sciences University, Brooklyn, NY*

26 **Early Detection of SARS-CoV-2 and Other Infections in Solid Organ Transplant Recipients and Household Members Using Wearable Devices**

E. H. Li[1], E. Mukhtar[1], E. D. Elftmann[1], F. R. Eweje[1], H. Gao[1], L. I. Ibrahim[1], R. G. Kathawate[1], A. C. Lee[1], K. A. Moore[1], N. Nair[1], S. Amaral[2], M. Snyder[3], B. J. Keating[1], *[1]Department of Surgery, Penn Transplant Institute, Division of Transplantation, Philadelphia, PA, [2]Department of Pediatrics, The Children's Hospital of Philadelphia, Philadelphia, PA, [3]Department of Genetics, Stanford University, Palo Alto, CA*

Live Video Question and Answer

COVID-19 Session 2

119 **COVID-19 Potential Donor Derived Transmission Events Investigations: Early DTAC Experience**

R. La Hoz, A. Agarwal, S. Aslam, K. Dunn, J. Goldman, D. Levine, C. Marboe, G. F. Marklin, S. M. Pouch, M. Rana, R. Razonable, H. L. Stevenson, H. Te, A. E. Woolley, M. Michaels, L. Danziger-Isakov, *OPTN DTAC, Richmond, VA*

120 **The Impact of Covid-19 Pandemic on Living Donor Liver and Renal Transplantations in Japan: A Nationwide Survey**

S. Yamanaga[1], T. Hibi[2], R. Osawa[3], K. Yuzawa[4], H. Egawa[5], K. Kuramitsu[6], *[1]General Surgery, Japanese Red Cross Kumamoto Hospital, Kumamoto, Japan, [2]Pediatric Surgery and Transplantation, Kumamoto University, Kumamoto, Japan, [3]Infectious disease, Kameda medical center, Kamogawa, Japan, [4]Transplant Surgery, Mito Medical Center, Higashiibaraki District, Japan, [5]Gastrointestinal Surgery, Tokyo Women's Medical University Hospital, Shinjyuku-ku, Japan, [6]HBP surgery, Kobe University, Kobe, Japan*

121 **T-Cell Responses in Solid Organ Transplant Recipients with SARS-CoV-2 Infection**

V. H. Ferreira, T. M. Marinelli, T. Ku, M. Ierullo, B. Majchrzak-Kita, I. Bahinskaya, N. Pinzon, A. Humar, D. Kumar, *University Health Network, Toronto, ON, Canada*

122 **Mortality, Risk Factors, and Treatment of Covid-19 Infection in Solid Organ Transplants: A Systematic Review and Meta-analysis**

S. Yin, T. Song, Q. Zhong, T. Lin, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

123 **Propensity Matched Analysis of Death and Non-favorable Discharge Among Hospitalized Transplant Recipients with COVID-19**

J. T. Swan[1], E. Rizk[2], S. L. Jones[1], N. Nwana[1], J. C. Nicolas[1], A. Tran[1], T. Nisar[1], T. Menser[1], S. G. Yi[2], L. W. Moore[1], A. O. Gaber[2], R. J. Knight[2], *[1]Houston Methodist Research Institute, Houston, TX, [2]Houston Methodist Hospital, Houston, TX*

124 **Covid-19 Related Deaths Across the U.S. in Kidney Transplant Recipients**

K. Goli, N. T. Galvan, R. Cotton, J. A. Goss, C. A. O'Mahony, A. Rana, *Department of Abdominal Transplantation, Baylor College of Medicine, Houston, TX*

125 **Impact of COVID-19 on Solid Organ Transplantation**

E. Sampson[1], S. Hall[2], K. Robichaux[3], A. Kumar[2], N. Kemmer[4], J. Buggs[5], *[1]Lake Erie College of Osteopathic Medicine, Tampa, FL, [2]Morsani College of Medicine, University of South Florida, Tampa, FL, [3]Honors College, University of South Florida, Tampa, FL, [4]Transplant Hepatology, Tampa General Hospital, Tampa, FL, [5]Transplant Surgery, Tampa General Hospital, Tampa, FL*

126 **Covid-19 in Solid Organ Transplantation (SOT): Results of the National Covid Cohort Collaborative (N3C)**

G. Agarwal[1], A. Vinson[2], R. Dai[3], E. French[4], S. Lee[5], A. Olex[4], A. Anzalone[6], V. Madhira[7], R. B. Mannon[8], *[1]Medicine, University of Alabama at Birmingham, Birmingham, AL, [2]Medicine/Nephrology, Nova Scotia Health Authority, Halifax, NS, Canada, [3]Biostatistics, University of Nebraska Medical Center, Omaha, NE, [4]Wright Center for Clinical and Translational Research, VIrginia Commonwealth University, Richmond, VA, [5]Medicine/Infectious Disease, University of Saskatchewan, Saskatoon, SK, Canada, [6]Neurology, University of Nebraska Medical Center, Omaha, NE, [7]Palia Software, Not sure, OR, [8]Medicine/Nephrology, University of Nebraska Medical Center, Omaha, NE*

Live Video Question and Answer

Hepatitis C

358 **Association of Donor Hepatitis C Virus Infection Status and Risk of Bk Polyomavirus Viremia After Kidney Transplantation**

V. S. Potluri[1], D. E. Schaubel[1], M. E. Sise[2], B. P. Concepcion[3], R. C. Forbes[1], E. A. Blumberg[1], D. Goldberg[4], P. P. Reese[1], R. Bloom[1], D. Shaffer[3], R. Chung[2], D. Sawinski[1], I. Strohben[2], N. Elias[2], A. Azhar[5], M. Shah[1], J. Eason[5], L. A. Binari[3], M. Talwar[5], V. Balaraman[5], A. Bhalla[5], B. Besharatian[1], M. Z. Molnar[5], *[1]University of Pennsylvania, Philadelphia, PA, [2]Massachusetts General Hospital, Boston, MA, [3]Vanderbilt University Medical Center, Nashville, TN, [4]University of Miami Miller School of Medicine, Miami, FL, [5]Methodist University Hospital, Memphis, TN*

359 **Outcomes of Short-Duration Anti-Viral Prophylaxis for Hepatitis C Positive Donor Kidney Transplants**

G. Gupta, I. Yakubu, P. Kimball, L. Kang, K. Mitchell, M. Shinbashi, D. Kumar, I. Moinuddin, L. Kamal, A. King, C. Bhati, M. Levy, A. Cotterell, A. Sharma, R. Sterling, *Virginia Commonwealth University Health System, Richmond, VA*

360 **Cost-Effectiveness Analysis of Short-Duration Anti-Viral Prophylaxis for Hepatitis C Positive Donor Kidney Transplants**

I. Yakubu, Y. Zhang, S. Ijioma, N. V. Carroll, J. Patterson, R. Sterling, G. Gupta, *Virginia Commonwealth University Health System, Richmond, VA*

361 **Are Tacrolimus Concentrations Reduced with Direct-acting Antiviral Administration in Transplant Recipients?**

K. Huang, K. Farrow, M. Christian, *Pharmacy, Penn State Health Hershey Medical Center, Hershey, PA*

362 **Outcomes of Kidney Transplantation from Hepatitis C Virus (HCV) Infected Donors Stratified by Recipient HCV Serostatus: A Mate Kidney Analysis**

K. K. Sureshkumar[1], B. Chopra[1], R. L. McGill[2], *[1]Nephrology and Hypertension, Allegheny General Hospital, Pittsburgh, PA, [2]Nephrology, University of Chicago, Chicago, IL*

363 **Outcomes of Hepatitis C Nucleic Acid Testing Positive Donors in Aviremic Recipients With Delayed Direct-Acting Antiviral Initiation**

M. Hudson, A. Webb, A. Logan, A. Silverman, A. Brueckner, *Pharmacy, Tampa General Hospital, Tampa, FL*

364 **Transplanting Hepatitis C Infected Organs Into Uninfected Recipients: A Pharmacy Perspective**

M. L. Holt, A. James, K. Gutierrez, T. Sparkman, J. Banbury, D. Jones, *University of Alabama at Birmingham Hospital, Birmingham, AL*

365 **Use of Donor Blood Expedites HCV Genotyping and Allows Earlier DAA Initiation for Recipients of HCV+ Kidneys**

B. Lonze, N. Ali, R. Montgomery, Z. Stewart Lewis, *Tranplant Institute, NYU Langone Health, New York, NY*

Live Video Question and Answer

Infections in Kidney Recipients

158 **Posttransplant Malignancy in HIV+ Kidney Transplant Recipients**
D. Sawinski[1], R. Fitzsimmons[1], J. Locke[2], J. Trofe-Clark[1], B. Shelton[2], P. Reese[1], E. Blumberg[1], *[1]Hospital of the University of Pennsylvania, Philadelphia, PA, [2]University of Alabama at Birmingham, Birmingham, AL*

159 **Influence of Induction Therapy and Antiretroviral Regimen on Outcomes in HIV Positive Renal Transplant Recipients**
C. Rogers Marks[1], C. Durand[2], J. Hand[3], M. Abidi[4], M. Malinis[5], B. Barnaba[2], H. Patel[6], C. D. Alonso[6], *[1]Massachussetts General Hospital, Boston, MA, [2]Johns Hopkins Medical Center, Baltimore, MD, [3]Ochsner Medical Center, New Orleans, LA, [4]Univ. of Colorado, Aurora, CO, [5]Yale, New Haven, CT, [6]Beth Israel Deaconess Medical Center, Boston, MA*

160 **Outcomes of Kidney Transplantation in HIV Positive Highly Sensitized Recipients**
S. Karhadkar, J. Panichella, H. Resweber, K. Nguyen, A. Di Carlo, S. Karhadkar, *Temple University School of Medicine, Philadelphia, PA*

161 **Infectious Complications After Belatacept Conversion in Kidney Transplant**
J. E. Marvin[1], D. Amenyedor[1], M. M. Azar[2], K. Belfield[1], V. Do[1], R. Formica[3], E. Cohen[1], *[1]Pharmacy, Yale New Haven Hospital, New Haven, CT, [2]Section of Infectious Diseases, Yale School of Medicine, New Haven, CT, [3]Section of Nephrology, Yale School of Medicine, New Haven, CT*

162 **Optimal Antimicrobial Duration for Donor Positive Cultures in Kidney Transplant Recipients**
J. Ferrante, K. Schnelle, M. Palettas, S. Sarwar, H. Winters, M. Chunduru, *Pharmacy, The Ohio State University Wexner Medical Center, Columbus, OH*

163 **Treatment of Biopsy-Proven Pyelonephritis of the Transplanted Kidney is Associated with Better Graft Outcomes**
F. Aziz, C. Saddler, J. Alstott, K. Swanson, S. Parajuli, N. Garg, A. Djamali, D. Mandelbrot, *University of Wisconsin, Madison, WI*

164 **The Metagenomic Landscape of Renal Transplant**
A. Johnson[1], G. Karadkhele[2], C. Larsen[2], *[1]Emory University, Atlanta, GA, [2]Surgery, Emory University, Atlanta, GA*

165 **Impact of High-Risk EBV Discordance Status on Survival Outcomes in Kidney Transplant Recipients: A Multivariable Analysis**
A. Dinesh[1], S. Jackson[2], T. L. Pruett[1], S. Riad[3], *[1]Division of Transplantation, Department of Surgery, University of Minnesota, Minneapolis, MN, [2]Biostatistics, Analytics Consulting Services- Solid Organ Transplant, M Health Fairview, Minneapolis, MN, [3]Department of Medicine, University of Minnesota, Minneapolis, MN*

Live Video Question and Answer

Infectious Disease Poutpouri

225 **Molecular Epidemiology of Extended-Spectrum Cephalosporin-Resistant Enterobacterales Bloodstream Infections Among Solid Organ Transplant Recipients**
J. A. Anesi[1], E. Lautenbach[1], P. D. Tamma[2], K. A. Thom[3], K. Alby[4], E. A. Blumberg[1], W. Bilker[1], J. Omorogbe[1], P. Tolomeo[1], A. Werzen[3], J. Han[5], *[1]University of Pennsylvania, Philadelphia, PA, [2]Johns Hopkins University, Baltimore, MD, [3]University of Maryland, Baltimore, MD, [4]University of North Carolina, Chapel Hill, NC, [5]GlaxoSmithKline, Rockville, MD*

226 **Cytomegalovirus (CMV) D+/R- Serostatus is Independently Associated with Mortality and Graft Loss After Liver Transplantation (LTx)**
P. Vutien, J. Perkins, S. Biggins, J. Reyes, A. Limaye, *Internal Medicine, University of Washington Medical Center, Seattle, WA*

227 **Cmv Specific Cellmediated Immune Reconstitution During Letermovir Prophylaxis in High Risk Hematopoietic Cell Transplant Recipients**
M. Abidi[1], J. Gutman[2], A. Weinberg[2], *[1]University of Colorado Denver/Anschutz Medical Campus, Aurora, CO, [2]University of Colorado Denver, Denver, CO*

228 **Impact of a Cmv Cell Mediated Immunity Based Protocol on Guiding Cmv Prophylaxis Following Pediatric Liver Transplantation - A Single Center Experience**
G. Kalkan[1], S. Ball[2], L. McConnell[2], D. M. Desai[3], A. Aqul[3], P. K. Sue[1], *[1]Infectious Disease, University of Texas Southwestern Medical Center, Dallas, TX, [2]Solid Organ Transplant Program, Children's Health, Dallas, TX, [3]Solid Organ Transplant Program, University of Texas Southwestern Medical Center, Dallas, TX*

229 **Outcomes of Abdominal Transplant Recipients Who Receive Organs from Donors with Positive Cultures**
A. Perez Cortes Villalobos, A. Humar, D. Kumar, *University Health Network, Toronto, ON, Canada*

230 **Evaluating Pneumocystis Jiroveci Pneumonia Prophylaxis in Lung Transplant Recipients**
J. Sharkey, K. McMurry, J. Park, C. Carlson, K. Gregg, D. Kaul, D. Lyu, L. Fitzgerald, *Michigan Medicine, Ann Arbor, MI*

231 **Epidemiology and Risk Factors for Invasive Fungal Infection in Pancreas Transplant in the Absence of Fungal Prophylaxis**
J. Burkey[1], J. M. Chen[2], A. A. Sharfuddin[2], M. S. Yaqub[2], A. J. Lutz[2], J. A. Powelson[2], J. A. Fridell[2], N. Barros[2], *[1]Butler University College of Pharmacy and Health Sciences, Indianapolis, IN, [2]Indiana University Health, Indianapolis, IN*

232 **Impact of a Pharmacist-driven Immunization Clinic on Vaccination Rates in Pre-liver Transplant Patients**
A. Poparad-Stezar[1], B. Summers[1], M. Fitzmaurice[1], K. Hakamiun[2], N. Sulejmani[3], A. Jantz[1], *[1]Henry Ford Hospital, Detroit, MI, [2]Select Medical, Wyandotte, MI, [3]CareDx, Inc., Sterling Heights, MI*

Live Video Question and Answer

ID: COVID-19

COVID-19 in Kidney Recipients

59 **COVID-19 in the Kidney Transplant Waitlist Population**
A. C. Johnson[1], C. P. Larsen[1], H. Gebel[2], R. Bray[2], *[1]Surgery, Emory University, Atlanta, GA, [2]Pathology, Emory University, Atlanta, GA*

60 **Predictors of Severe Covid-19 in Kidney Transplant Recipients in the First and Second Waves: Analysis of the Spanish Registry**
M. Crespo[1], A. Mazuecos[2], I. Pérez-Flores[3], F. Moreso[4], A. Andrés[5], C. Jimenez[6], M. Molina[7], C. Canal[8], L. Sánchez-Cámara[9], S. Zárraga[10], M. Ruiz Fuentes[11], M. Aladrén[12], E. Melilli[13], V. López[14], E. Sanchez[15], J. Pascual for Spanish Nephro Society Covid-Registry[1], *[1]Nephrology, Hospital del Mar, Barcelona, Spain, [2]Nephrology, Hospital Puerta del Mar, Cadiz, Spain, [3]Nephrology, Hospital Clinico San Carlos, Madrid, Spain, [4]Nephrology, Hospital Valle Hebrón, Barcelona, Spain, [5]Nephrology, Hospital 12 Octubre, Madrid, Spain, [6]Nephrology, Hospital La Paz, Madrid, Spain, [7]Nephrology, Hospital Germans Trias i Pujol, Barcelona, Spain, [8]Nephrology, Fundacio Puigvert, Barcelona, Spain, [9]Nephrology, Hospital Gregorio Marañón, Madrid, Spain, [10]Nephrology, Hospital de Cruces, Bilbao, Spain, [11]Nephrology, Hospital Virgen de las Nieves, Granada, Spain, [12]Nephrology, Hospital Miguel Servet, Zaragoza, Spain, [13]Nephrology and Kidney Transplantation, Hospital de Bellvitge, Barcelona, Spain, [14]Nephrology, Hospital Regional de Málaga, Malaga, Spain, [15]Nephrology, Hospital de Cabueñes, Gijon, Spain*

61 **SARS-CoV-2 Antibody Response After Induction Therapy in Kidney Transplant Recipients**
M. Lubetzky[1], S. Sultan[2], Z. Zhao[3], M. Cushing[3], Z. Kapur[1], S. Albakry[1], N. Hauser[1], J. Marku-Podvorica[1], R. Craig-Schapiro[2], J. Lee[1], T. Salinas[1], M. Aull[2], S. Kapur[2], M. 66 **Modification in Immunosuppression Regimens to Safely Perform Kidney Transplants Amid the Covid-19 Pandemic**
L. Von Stein, O. Witkowsky, L. Samidurai, K. Flores, M. Doraiswamy, T. Pesavento, P. Singh, *The Ohio State University Wexner Medical Center, Columbus, OH*

Live Video Question and Answer

Kidney

Kidney Antibody Mediated Rejection

317 **DSA Causes Mild Molecular ABMR-like Changes in Many Biopsies Not Diagnosed as Rejection**
P. F. Halloran[1], K. S. Madill-Thomsen[1], &. the INTERCOMEX Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

318 **Beyond Microarrays: Insights from Ncounter Transcript Analysis of Routine Archival Kidney Allograft Biopsies**
I. Rosales, K. Tomaszewski, A. Milagros, T. Kawai, R. Smith, R. Colvin, *Massachusetts General Hospital, Boston, MA*

319 **Transplant Glomerulopathy in the Absence of Donor-specific HLA Antibodies: Risk Factors, Histopathological Features and Graft Outcome**
A. Senev, E. Van Loon, M. Emonds, M. Naesens, *Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium*

320 **High Donor-Derived Cell-Free DNA Levels Predict Development of De Novo HLA Donor-Specific Antibodies After Kidney Transplantation - Data from the ADMIRAL Study**
G. Gupta[1], T. Alhamad[2], V. Bowers[3], I. Moinuddin[1], S. Ghosh[4], J. Zeng[4], E. Stites[5], A. Pai[6], J. S. Bromberg[7], S. Anand[8], *[1]Virginia Commonwealth University, Richmond, VA, [2]Washington University in St. Louis, St. Louis, MO, [3]Tampa General Hospital, Tampa, FL, [4]CareDx, Brisbane, CA, [5]University of Colorado, Aurora, CO, [6]University of Texas McGovern Medical School, Houston, TX, [7]University of Maryland School of Medicine, Baltimore, MD, [8]Intermountain Medical Center, Murray, UT*

321 **Novel Mixed Lymphocyte Reaction Monitoring System That Predicts Chronic Antibody- Mediated Rejection in Kidney Transplant Recipients**
N. Iwahara[1], K. Hotta[1], T. Tanabe[1], D. Iwami[2], Y. Takada[3], H. Higuchi[1], H. Sasaki[3], H. Harada[3], N. Shinohara[1], *[1]Hokkaido Univercity, Sapporo, Japan, [2]Jichi Medical University, Shimotsuke, Japan, [3]Sapporo City General Hospital, Sapporo, Japan*

322 **The Trifecta Study: Calibrating Circulating Donor-Derived Cell-Free DNA at the Time of Indication Biopsies Against the Molecular Phenotype of the Biopsy Reveals a Prominent Association with NK Cell Genes**
P. Halloran[1], Z. Demko[2], A. Prewett[2], J. Reeve[1], P. Billings[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]Natera Inc., San Carlos, CA*

323 **Prospective Intensive Monitoring for Anamnestic DSA Responses Allows Near Elimination of Early Clinical AMR**
M. McGowan[1], A. Bickenbach[1], A. R. Shields[2], R. R. Alloway[1], P. Brailey[1], E. Portwood[1], C. Alquist[1], A. Christianson[1], B. Abu Jawdeh[1], M. Cuffy[1], J. Kremer[2], S. Bumb[1], A. Govil[1], M. Anand[1], T. Kaur[1], E. S. Woodle[1], *[1]U Cincinnati, Cincinnati, OH, [2]Christ Hospital, Cincinnati, OH*

324 **$CD56^{dim}CD16^{bright}$ NK Cells from Kidney Transplant Recipients with Antibody-mediated Rejection Display Increased Proliferation, Type-1 Activation and Cytotoxic Profile**
E. Bailly[1], C. Macedo[1], K. Louis[1], B. Ramaswami[1], M. Lucas[1], C. Bentlejewski[1], P. Randhawa[1], A. Zeevi[1], C. Lefaucheur[2], D. Metes[1], *[1]Department of Surgery, Thomas E. Starzl Transplantation Institute, Pittsburgh, PA, [2]INSERM UMR-S976. Endothelium, Inflammation & Alloreactivity, Université de Paris, Paris, France*

Live Video Question and Answer

Kidney Complications

173 **Mapping Chronic Kidney Disease (CKD) and Acute Kidney Injury (AKI) in Kidney Transplant Biopsies Reveals Two Classes of Early AKI That Differ in Their Response-to-Wounding**
P. Halloran[1], J. Reeve[1], G. Böhmig[2], O. Viklicky[3], M. Myslak[4], G. Gupta[5], &. the INTERCOMEX Study Group[6], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]Medical University of Vienna, Vienna, Austria, [3]Institute for Clinical and Experimental Medicine, Prague, Czech Republic, [4]Pomeranian Medical University, Szczecin, Poland, [5]Virginia Commonwealth University, Richmond, VA, [6]AB, Canada*

174 **Oxalate Nephropathy After Kidney Transplant: Defining Histological Patterns, Contributing Factors and Graft Outcome**
N. Jakob[1], A. Chuu[1], J. Ninan[1], E. Lim[1], N. Zhang[1], H. Amer[2], F. Cosio[2], H. Wadei[3], M. Ryan[1], C. Cortese[3], L. Cornell[2], M. Keddis[1], *[1]Nephrology, Mayo Clinic, Scottsdale, AZ, [2]Nephrology, Mayo Clinic, Rochester, MN, [3]Nephrology, Mayo Clinic, Jacksonville, FL*

175 **Kidney Donor Risk Index: Significance as a Predictor of Kidney Transplant Outcomes Beyond Allograft Survival, Analysis of 18 Adjusted Regression Models Involving Adult Deceased Donor Kidney Recipients**
A. Santos, E. Bueno, M. A. Leghrouz, *University of Florida, Gainesville, FL*

176 **The Effect of Delayed Graft Function on Early versus Late Mortality Following Kidney Transplantation**
W. Irish[1], Y. Fu[2], D. B. Leeser[1], K. V. Ravindra[3], C. Haisch[1], J. Tuttle[1], *[1]Surgery, East Carolina University, Greenville, NC, [2]Mathematics, East Carolina University, Greenville, NC, [3]Surgery, Duke University, Durham, NC*

177 **Outcomes of Kidney Transplant Recipients With Sickle Cell Disease: An Analysis of the 2000-2019 UNOS/ OPTN Database**
N. Leeaphorn[1], C. Thongprayoon[2], C. Jadlowiec[3], A. Chewcharat[4], P. Hansrivijit[5], S. Katari[1], P. Vaitla[6], L. Cummings[1], M. Cooper[7], W. Cheungpasitporn[2], *[1]Saint Luke's Health System, Kansas City, MO, [2]Mayo Clinic, Rochester, MN, [3]Mayo Clinic, Phoenix, AZ, [4]Mount Auburn Hospital, Cambridge, MA, [5]University of Pittsburgh Medical Center Pinnacle, Harrisburg, PA, [6]University of Mississippi Medical Center, Jackson, MS, [7]Medstar Georgetown Transplant Institute, Washington, DC*

178 **Worsening Impact of Acute Kidney Rejection on Long Term Graft Survival from 2000 to 2014**
D. Leeser[1], W. Irish[1], K. Ravindra[2], V. Villani[2], A. Connor[2], J. Tuttle[1], *[1]Surgery, East Carolina University, Greenville, NC, [2]Surgery, Duke University, Durham, NC*

179 **Angiotensin II Type-1 Receptor Antibodies are Associated with Inferior Renal Allograft Survival**
P. Martin, E. Santos, N. Gunby, M. Willicombe, *Renal Department, Imperial College Healthcare NHS Trust, London, United Kingdom*

180 **Post-Transplant Idiopathic Immune Complex Glomerulonephritis**
F. Aziz, T. Singh, N. Garg, D. Mandelbrot, *University of Wisconsin, Madison, WI*

Live Video Question and Answer

Kidney Deceased Donor Allocation

27 **Clinical Outcomes and Racial Impact of HLA Matching in the Australian Deceased Donor Kidney Transplantation Program, 2000-2018**
M. Gramlick, M. Heer, *Department of Surgery, John Hunter Hospital, Newcastle, Australia*

28 **Allocating Kidneys in Optimized Circles: Logistics are More Important Than Distance**
R. Saidi, R. Shahbazov, M. Hanlon, M. laftavi, *SUNY Upstate, Syracuse, NY*

29 **Status of Kidney Allocation in Liver-kidney Transplants Before and After the UNOS/OPTN Policy**
J. Oveyssi, M. Hussain, P. Homkrailas, S. Bunnapradist, *Department of Internal Medicine: Division of Transplant Nephrology, UCLA, Los Angeles, CA*

30 **The Association Between Environmental Determinants and High KDRI Organ Offer Acceptance Ratios**
A. M. Placona, C. Martinez, M. Stuart, *United Network for Organ Sharing, Henrico, VA*

31 **Kidney Transplantation in Very Highly-Sensitized Patients with Maastricht Type III Non-heart-Beating Donors**
F. Villanego[1], A. Mazuecos[1], L. Vigara[1], V. Lopez[2], G. Bernal[3], A. Rodriguez-Benot[4], M. de Gracia[5], P. Castro[6], A. Alvarez[6], *[1]Department of Nephrology, Hospital Puerta del Mar, Cadiz, Spain, [2]Department of Nephrology, Hospital Carlos Haya, Malaga, Spain, [3]Department of Nephrology, Hospital Virgen del Rocio, Sevilla, Spain, [4]Department of Nephrology, Hospital Reina Sofia, Cordoba, Spain, [5]Department of Nephrology, Hospital Virgen de las Nieves, Granada, Spain, [6]Andalusian Transplant Coordination, Sevilla, Spain*

32 **Impact of CHA2DS2-VASc Score on Postoperative Mortality Following Kidney Transplant**
J. Klein[1], M. Rangel[1], Z. Spigel[2], E. Hollinger[1], D. Olaitan[1], M. Hertl[1], E. Chan[1], *[1]Surgery, Rush University Medical Center, Chicago, IL, [2]Surgery, Allegheny Health Network, Pittsburgh, PA*

33 **Renal Transplant Outcomes of Kidney-only vs. Multi-organ Deceased Donors**
J. Espinales[1], Z. C. Giffen[1], D. Schneider[2], R. James[3], N. Koizumi[3], O. Ekwenna[1], J. Ortiz[4], *[1]University of Toledo Medical Center, Toledo, OH, [2]UC Irvine School of Medicine, Irvine, CA, [3]George Mason University, Arlington, VA, [4]Albany Medical Center, Albany, NY*

34 **Construction of a Waiting Time Predictive Model for Kidney Transplant with Deceased Donor in the State of São Paulo**
J. Silva[1], M. Contti[1], M. Valiatti[1], H. Nga[1], G. Santos[1], M. Perosa[2], G. Ferreira[3], L. Modelli de Andrade[1], *[1]UNESP, Botucatu, Brazil, [2]Hospital Leforte, São Paulo, Brazil, [3]Santa Casa de Juiz de Fora, Juiz de Fora, Brazil*

Live Video Question and Answer

Kidney Deceased Donor Selection

127 **Findings from the Bareto Study: Associations Between Chronic Vascular Changes and 10-year Transplant Graft Outcomes**
L. Kamal[1], D. Stewart[2], J. Foutz[2], H. McGehee[2], P. Saravanane[1], S. Yu[1], R. Yusfi[1], G. Gupta[1], *[1]Virginia Commonwealth University, Richmond, VA, [2]UNOS, Richmond, VA*

128 **An HLA Class II Matching Strategy That Predicts De Novo Donor-specific HLA Antibody Formation Using Low Resolution HLA Types**
L. Hidalgo[1], I. Martinez Juarez[2], L. Morales Buenrostro[2], S. Shojai[3], P. Campbell[1], *[1]University of Wisconsin Madison, Madison, WI, [2]Instituto Nacional de Ciencias Medicas Y Nutricion Salvador Zubrian, Mexico City, Mexico, [3]Medicine, University of Alberta, Edmonton, AB, Canada*

129 **Outcomes from High KDPI Kidneys Utilized for Dual Kidney Transplantation**
J. Wagler[1], K. Mitchell[2], S. Ohara[3], R. Heilman[2], S. K. Reddy[2], H. Khamash[2], C. Jadlowiec[2], *[1]Mayo Clinic Arizona, Phoenix, AZ, [2]Mayo Clinic, Phoenix, AZ, [3]Valleywise Health General Surgery Residency Program, Phoenix, AZ*

130 **Successful Outcomes from Selected Akin3 Donors Requiring Renal Replacement: Avenue for Increase in Organ Utilization**
P. Budhiraja[1], R. L. Heilman[1], M. L. Smith[2], H. A. Khamash[1], L. Kodali[1], A. A. Moss[3], A. K. Mathur[3], C. Jadlowiec[3], K. S. Reddy[3], *[1]Medicine, Mayo Clinic, Phoenix, AZ, [2]Pathology, Mayo Clinic, Phoenix, AZ, [3]Surgery, Mayo Clinic, Phoenix, AZ*

131 **Outcomes of Kidney Transplant Recipients (KTRs) Comparing Brain Dead Donors' vs Donation After Cardiac Death Stratified by KDPI, Focus on Marginal Kidneys: A UNOS Database Analysis**
B. Chopra[1], K. K. Sureshkumar[1], D. Rajasundaram[2], E. C. Rodrigo[3], *[1]Allegheny Health Network, Pittsburgh, PA, [2]UPMC, Pittsburgh, PA, [3]University Hospital Marqués de Valdecilla, Santander, Spain*

132 **Expanding A_2 to B Kidney Transplantation: Safe and Effective Use of Recipients with High Titer Antibodies**
A. Gilbert[1], S. Radomski[2], J. Verbesey[1], J. Vucci[1], M. Cooper[1], *[1]Medstar Georgetown Transplant Institute, Washington, DC, [2]Department of Surgery, Johns Hopkins Medical Center, Baltimore, MD*

133 **How Long is the Wait Worthwhile: Cost-Effectiveness of Accepting a Kidney from a Donor with Apolipoprotein L1 High-Risk Genotype**
K. Lentine[1], D. Brennan[2], M. Wang[3], M. Schnitzler[4], H. Xiao[4], D. Axelrod[5], J. Snyder[6], K. Lentine[4], *[1]Saint Louis University, St. Louis, MO, [2]Johns Hopkins, Baltimore, MD, [3]Washington Univ, Saint Louis, MO, [4]Saint Louis Univ, Saint Louis, MO, [5]Univ of Iowa, Iowa City, IA, [6]SRTR, Minneapolis, MN*

Live Video Question and Answer

Kidney Desensitization/KPD

166 **Desensitization Using Clazakizumab® (anti-il-6) in Highly-hla Sensitized Patients Awaiting Kidney Transplant (nct03380962)**

A. A. Vo[1], N. Ammerman[1], E. Huang[1], M. Toyoda[2], S. Ge[2], A. Peng[1], R. Najjar[1], S. Sethi[1], S. Williamson[1], C. Myers[1], K. Lim[1], M. Gillespie[1], S. Jordan[1], *[1]Kidney Transplant, Cedars Sinai Medical Ctr, Los Angeles, CA, [2]Transplant Immunology Laboratory, Cedars Sinai Medical Ctr, Los Angeles, CA*

167 **The Effect of Daratumumab (Dara, Humanized Anti-CD38 Monoclonal Antibody) on Immune Cells In Vitro and in a HLA-Sensitized Kidney Transplant Patient (HS KTx Pt) Desensitized (DES) with Dara**

S. Ge[1], M. Chu[1], A. De Guzman[1], E. Ortiz[1], A. Vo[2], N. Ammerman[2], S. C. Jordan[2], M. Toyoda[1], *[1]Transplant Immunology Laboratory, Cedars Sinai Medical Center, Los Angeles, CA, [2]Comprehensive Transplant Center, Cedars Sinai Medical Center, Los Angeles, CA*

169 **Additional Value to Participation in a National Paired Kidney Exchange Program: Exploring Characteristics of Chain End Living Donors and Waitlist Recipients**

N. Osbun[1], A. Thomas[2], M. Cooper[3], S. Flechner[4], D. Segev[2], J. Veale[1], *[1]Urology, University of California Los Angeles, Los Angeles, CA, [2]Johns Hopkins University, Baltimore, MD, [3]Medstar Georgetown Transplant Institute, Washington DC, DC, [4]Cleveland Clinic, Cleveland, OH*

170 **Kidney Paired Exchange in Children in the United-states**

J. Hogan[1], A. G. Thomas[2], J. Verbesey[3], D. L. Segev[4], *[1]Transplant Research Center, Department of Surgery, Emory University, Atlanta, GA, [2]Department of Epidemiology, University of North Carolina, Chapel Hill, NC, [3]Department of Surgery, Medstar Georgetown Transplant Institute, Washington, DC, [4]Department of Surgery, Johns Hopkins University, Baltimore, MD*

171 **Right Kidneys and Kidneys with Complex Anatomy are More Likely to be Transplanted to the Waiting List in a National Kidney Paired Donation Program**

N. Osbun[1], A. Thomas[2], A. Waterman[3], J. Veale[1], D. Segev[2], D. Leeser[4], *[1]Urology, University of California Los Angeles, Los Angeles, CA, [2]Johns Hopkins University, Baltimore, MD, [3]University of California Los Angeles, Los Angeles, CA, [4]East Carolina University, Greenville, NC*

172 **The Benefits of Sharing Non-Directed Donors Nationally Through Paired Exchange**

J. Verbesey[1], A. G. Thomas[2], A. D. Waterman[3], J. Vucci[1], G. Vranic[1], A. Gilbert[1], S. Ghasemian[1], M. Cooper[1], *[1]Georgetown University Hospital, Washington, DC, [2]Johns Hopkins University School of Medicine, Baltimore, MD, [3]UCLA, Los Angeles, CA*

Live Video Question and Answer

Kidney Immunosuppression

273 **A Phase 1 Study to Evaluate the Safety, Tolerability and Pharmacokinetics of At-1501**

S. Perrin[1], A. Gill[2], C. Gill[2], P. Gustafson[1], *[1]Novus Therapeutics, Irvine, CA, [2]ALS Therapy Development Institute, Cambridge, MA*

274 **Evaluation of a Weight-Based Mycophenolate Mofetil Dosing Protocol for Kidney Transplant Maintenance Immunosuppression**

M. Mahoney[1], E. Kincaide[1], J. Nelson[1], K. Klein[1], R. Hall[1], S. Bhayana[2], *[1]University Health, San Antonio, Department of Pharmacotherapy and Pharmacy Services, The University of Texas at Austin, Pharmacotherapy Division, College of Pharmacy, San Antonio, TX, [2]University Transplant Center, University Health, San Antonio, Department of Nephrology, The University of Texas Health Science Center at San Antonio, San Antonio, TX*

275 **The Clinical Validation of a Dried Blood Spot Method for Simultaneous Tacrolimus and Creatinine Measurement**

M. I. Francke[1], S. Bouarfa[2], B. van Domburg[2], D. van de Velde[2], M. E. Hellemons[3], O. C. Manintveld[4], S. M. Last-Koopmans[5], M. B. Mulder[2], D. A. Hesselink[1], B. C. de Winter[2], *[1]Internal medicine, nephrology and transplantation, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [2]Hospital Pharmacy, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [3]Pulmonary medicine, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [4]Cardiology, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [5]Hematology, Erasmus MC, University Medical Center, Rotterdam, Netherlands*

276 **CD40 Blockade by the Fc-Silent Immunosuppressive Antibody Iscalimab Results in Diminished B Cell Activation and Differentiation and is Paralleled by Whole Blood Gene Expression Data**

R. Kraaijeveld[1], M. W. van den Hoogen[1], A. E. de Weerd[1], E. Ferroro[2], G. Robert[2], U. Laessing[2], B. Haraldsson[2], J. S. Rush[2], C. C. Baan[1], *[1]Erasmus MC, Rotterdam, Netherlands, [2]Novartis Pharmaceuticals AG, Basel, Switzerland*

277 **Conversion to Belatacept Based Immunosuppression Regimen in Kidney Transplant Patients: Lessons Learned**

R. Saidi, N. Huang, C. Yang, I. Movileanu, K. Ecal, A. Senay, O. Pankewycz, R. Dvorai, R. Shahbazov, M. Laftavi, *SUNY Upstate, Syracuse, NY*

278 **Immunosuppression and Cancer Risk in Kidney Transplant Recipients: A Retrospective Cohort Study**

R. Sapir-Pichhadze[1], C. Laprise[1], X. Zhang[1], M. Abrahamowicz[1], M. Beauchamp[2], A. Della Vecchia[1], L. Azoulay[1], E. Franco[1], B. Nicolau[1], *[1]McGill University, Montreal, QC, Canada, [2]McGill University Health Centre, Montreal, QC, Canada*

279 **Clinical Outcomes Associated with Induction Therapy Regimens for Kidney Transplantation in Children: A NAPRTCS and PHIS Collaborative Report**

H. Pizzo[1], D. Levy Erez[2], N. M. Rodig[3], T. Richardson[4], M. Somers[3], *[1]Pediatric Nephrology, Cedars-Sinai Medical Center, Los Angeles, CA, [2]Nephrology Institute, Schneider Children's Medical Center, Tel Aviv, Israel, [3]Nephrology, Boston Children's Hospital, Boston, MA, [4]Children's Hospital Association, Lenexa, KS*

280 **Single-Dose Basiliximab Induction Therapy in Low-Immunologic Risk Kidney Transplant Recipients**

A. Hutchins, J. Schoen, J. S. McMullen, *Pharmacy, Nebraska Medicine, Omaha, NE*

Live Video Question and Answer

Kidney Psychosocial

325 **The Relationship Between Health Literacy and Adverse Outcomes After Kidney Transplantation**

E. Lorenz, T. Petterson, C. Schinstock, W. Sanchez, K. Yost, *Mayo Clinic, Rochester, MN*

326 **Evolving Trends in Risk Profiles and Outcomes in Older Adults Undergoing Kidney Re-Transplantation**

S. Sandal[1], J. Ahn[2], M. Cantarovich[1], N. Chu[2], D. Segev[2], M. McAdams DeMarco[2], *[1]McGill University, Montreal, QC, Canada, [2]Johns Hopkins University, Baltimore, MD*

327 **Journey to Transplant: A Pilot Feasibility Trial of a Virtual Counseling Intervention for Patients and Their Social Support Networks to Improve Access to Kidney Transplant**

A. Hart[1], R. Edpuganti[2], H. D'Cunha[2], S. Kurschner[2], W. T. McKinney[1], A. Matas[1], R. Patzer[1], S. Chu[1], M. Bruin[1], M. Partin[1], *[1]Hennepin Healthcare, University of Minnesota, Minneaplis, MN, [2]Hennepin Healthcare Research Institute, Minneaplis, MN*

328 **Understanding Transplant Decision Making Concerns for African, Caribbean and Black Canadian Patients with End-Stage Kidney Disease**

N. Singh[1], A. Wasim[1], W. Hajjar[1], K. Mohan[1], N. El-Dassouki[1], H. Habbal[1], L. Angarso[1], A. Dychiao[1], S. Macanovic[1], A. D. Waterman[2], I. Mucsi[1], *[1]University Health Network, Toronto, ON, Canada, [2]David Geffen School of Medicine, UCLA, Los Angeles, CA*

329 **Depressive Symptoms and Listing for Kidney Transplantation**

X. Chen, N. Chu, P. Sharma Basyal, W. Vihokrut, D. Crews, D. Brennan, S. Andrews, T. Vannorsdall, D. Segev, M. McAdams DeMarco, *Johns Hopkins University School of Medicine, Baltimore, MD*

330 **Multistep Algorithm to Achieve Weight Loss Goal in Advanced Stage Obesity Kidney Transplant Candidates: A Single Center Preliminary Report**

A. Shah, J. Galpern, L. Castaldo, P. Touhy, M. Thomas, A. Aaron, M. Fruscione, L. Dageforde, N. Elias, *Transplant Surgery, Massachusetts General Hospital, Boston, MA*

331 **Challenges and Stressors of COVID-19 Kidney and Transplant Patients: A Mixed Methods Study**

Y. A. Iraheta[1], A. L. Murillo[2], E. H. Wood[1], S. M. Advani[3], R. Pines[4], A. D. Waterman[1], *[1]UCLA David Geffen School of Medicine, Los Angeles, CA, [2]Terasaki Institute, Los Angeles, CA, [3]National Human Genome Research Institute (NIH), Bethesda, MD, [4]Santa Barbara Cottage Hospital, Santa Barbara, CA*

333 **Early Transplant Education Increases CKD 3-5 Patients' Knowledge and Informed Decision-Making About Chronic Kidney Disease and Living Donor Kidney Transplant**

A. D. Waterman[1], S. H. Kawakita[2], B. Dub[3], Y. A. Iraheta[1], A. L. Murillo[2], T. Menser[4], B. Mittman[3], *[1]UCLA David Geffen School of Medicine, Los Angeles, CA, [2]Terasaki Institute, Los Angeles, CA, [3]Research and Evaluation, Kaiser Permanente, Pasadena, CA, [4]The Houston Methodist Research Institute, Houston, CA*

Live Video Question and Answer

Kidney: Acute Cellular Rejection

233 **Belatacept Exposure Not Associated With Rejection. Can Doses be Lowered without Compromising Efficacy?**

M. McGowan[1], A. Bickenbach[1], B. Miyagawa[2], A. Christianson[1], T. Mizuno[2], P. West-Thielke[3], J. Leone[4], E. Woodle[1], D. Kaufman[5], A. Wiseman[6], A. Matas[7], A. Vinks[2], R. Alloway[1], *[1]U Cincinnati, Cincinnati, OH, [2]Cincinnati Children's Med Center, Cincinnati, OH, [3]U Illinois, Chicago, IL, [4]Tampa Gen, Tampa, FL, [5]U Wisconsin, Madison, OH, [6]Centura Transplant, Denver, CO, [7]U Minnesota, Minneapolis, MN*

234 **The Effect of the Different Donor-Derived HLA T-Cell Epitope Targets on the Development of T Cell-Mediated Rejection After Kidney Transplantation**

A. Senev, E. Van Loon, M. Emonds, M. Naesens, *Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium*

235 **Reducing Rejection in Pediatric Kidney Transplantation: The Improving Renal Outcomes Collaborative (iroc)**

C. Varnell[1], A. Warmin[1], G. Barletta[2], C. Belsha[3], L. Harshman[4], D. Kershaw[5], C. Pruette[6], S. Ranabothu[7], M. Seifert[8], P. Singer[9], M. Yanik[10], K. Rich[1], A. Modi[1], D. Hooper[1], *[1]Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [2]Phoenix Children's Hospital, University of Arizona, Phoenix, AZ, [3]SSM Health Cardinal Glennon Children's Hospital, St Louis, MO, [4]University of Iowa Stead Family Children's Hospital, Iowa City, IA, [5]C.S. Mott Children's Hospital, Ann Arbor, MI, [6]Johns Hopkins University School of Medicine, Baltimore, MD, [7]Arkansas Children's Hospital, Little Rock, AR, [8]University of Alabama at Birmingham, Children's of Alabama, Birmingham, AL, [9]Cohen Children's Hospital, Brooklyn, NY, [10]Levine Children's Hospital, Charlotte, NC*

236 **Reassessing TCMR in Kidney Transplant Indication Biopsies: Emerging Evidence for Partial Exhaustion in Late TCMR**
P. Halloran[1], J. Reeve[1], &. the INTERCOMEX Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

237 **Development of Diagnosis Method of Acute Graft Rejection After Kidney Transplantation Using Metabolome Analysis by Liquid Biopsy Approach**
H. Iwamoto[1], M. Sugimoto[2], O. Konno[1], I. Akashi[3], M. Okihara[1], Y. Kihara[1], T. Ueno[1], *[1]Kidney Transplantation Surgery, Tokyo Medical University, Hachioji Medical Center, Tokyo, Japan, [2]Research and Development Center for Minimally Invasive and Preemptive Medicine, Institute of Medi, Tokyo Medical University, Tokyo, Japan, [3]Kidney transplantation Surgery, Tokyo Medical University, Hachioji Medical Center, Tokyo, Japan*

239 **Late Subclinical Rejection and Borderline Rejection in Kidney Transplant Patients is Associated with Increased Incidence of Subsequent Clinical Rejections**
V. Viswanathan[1], I. Melgarejo[2], C. Puttarajappa[2], P. Sood[2], M. Molinari[2], S. Hariharan[2], C. Wu[2], A. Sharma[2], N. Shah[2], R. Mehta[2], *[1]Department of Medicine, Renal-Electrolyte Division, University of Pittsburgh Medical Center, Pittsburgh, PA, [2]Department of Surgery, Thomas E. Starzl Transplantation Institute, University of Pittsburgh Medical Center, Pittsburgh, PA*

240 **Therapeutic Response of Late Clinical Cell Mediated Rejection is Modeled by Chronicity Changes**
I. Melgarejo[1], V. Visnawathan[2], A. Sharma[1], P. Sood[1], C. Puttarajappa[1], C. Wu[1], N. Shah[1], M. Molinari[1], S. Hariharan[1], R. Mehta[1], *[1]Starzl Transplant Institute, University of Pittsburgh Medical Center, Pittsburgh, PA, [2]Department of Medicine, Renal-Electrolyte Division, University of Pittsburgh Medical Center, Pittsburgh, PA*

Live Video Question and Answer

Kidney: Cardiovascular and Metabolic Complications

67 **Cognition After Belatacept Conversion (CAB) Trial**
W. Asch[1], K. Belfield[2], V. Do[2], E. Cohen[1], *[1]Yale University, New Haven, CT, [2]Yale New Haven Hospital, New Haven, CT*

69 **The Impact of 4-weeks of Supervised Exercise on Frailty and Lower Extremity (LE) Function in Patients with Advanced Chronic Kidney Disease (CKD)**
E. Lorenz, L. Hickson, R. Weatherly, K. Thompson, M. Hogan, C. Kennedy, *Mayo Clinic, Rochester, MN*

70 **Growth Differentiation Factor 15 Predictor Value is Superior to Troponin I in the Evaluation of Kidney Transplant Candidates**
M. de Cos Gomez[1], M. Garcia Unzueta[2], A. Benito Hernandez[1], J. Mazon Ruiz[1], M. Perez Arnedo[1], A. Aguilera Fernandez[1], R. Valero San Cecilio[1], J. Ruiz San Millan[1], E. Rodrigo Calabia[1], *[1]Nephrology, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain, [2]Clinical Analysis, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain*

71 **Intensive Blood Pressure Control Preserves Kidney Allograft Function**
K. A. Agarwal[1], U. K. Agarwal[2], G. S. Silva[3], K. J. Pollick[3], M. Pavlakis[1], *[1]Transplant Institute, Beth Israel Deaconess Medical Center, Boston, MA, [2]Biostatistics consultant, Boston, MA, [3]Beth Israel Deaconess Medical Center, Boston, MA*

72 **Outcomes of Kidney Transplantation in Patients with Prosthetic Heart Valves**
H. Ouahmi, *Nephrology, Dialysis, Transplantation, Nice University Hospital, Nice, France*

73 **Correlation of Coronary Anatomy and Interventions with Post-kidney Transplantation Outcomes**
A. Sharma, T. Teigeler, D. Kumar, S. Moldowan, C. Bhati, G. Gupta, L. Kang, M. Levy, *Virginia Commonwealth University, Richmond, VA*

74 **Kidney Transplant Recipients Who Had Covid-19 Prior to Transplant: A Single-center Experience**
S. Sultan, M. Aull, R. Craig-Schapiro, E. C. Liu, J. H. Lee, S. Kapur, *New York Presbyterian / Weill Cornell, New York, NY*

Live Video Question and Answer

Live Kidney Donation

366 **Long Term Outcomes of Kidney Donors with Fibromuscular Dysplasia**
H. N. Adrogue[1], A. Evans[1], S. A. Hebert[1], H. E. Adrogue[1], D. T. Nguyen[2], D. Murad[1], E. A. Graviss[2], *[1]Medicine, Houston Methodist Hospital, Houston, TX, [2]Pathology and Genomic Medicine, Houston Methodist Hospital, Houston, TX*

367 **Pre- Kidney Donation Pregnancy Complications and Long-Term Outcomes**
E. Helgeson[1], E. F. Palzer[1], D. Vock[1], A. Matas[2], *[1]University of Minnesota School of Public Health, Minneapolis, MN, [2]University of Minnesota Medical School, Minneapolis, MN*

368 **The Risk of Post-donation Kidney Function Impairment for Prospective Living Kidney Donors with Persistent Isolated Microscopic Hematuria**
J. v. Weijden[1], M. van Londen[1], I. M. Nolte[2], M. H. De Borst[1], S. P. Berger[1], *[1]Nephrology, University Medical Center Groningen, Groningen, Netherlands, [2]Epidemiology, University Medical Center Groningen, Groningen, Netherlands*

369 **Living Donor Kidney Transplantation Racial Disparities Persist Independent of Social Vulnerability**
A. C. Killian[1], M. C. McLeod[1], B. Shelton[1], R. D. Reed[1], P. MacLennan[1], H. Qu[1], B. J. Orandi[1], V. Kumar[1], D. Sawinski[2], R. M. Cannon[1], D. J. Anderson[1], M. J. Hanaway[1], J. E. Locke[1], *[1]University of Alabama at Birmingham Hospital, Birmingham, AL, [2]Hospital of the University of Pennsylvania, Philadelphia, PA*

370 **Implications of Trends in Child to Parent Kidney Donation in Whites and African Americans**
N. Jean, S. Krishnamoorthy, Y. Kyeso, P. Cunningham, N. Murthy, R. McGill, M. Josephson, *Nephrology, University of Chicago, Chicago, IL*

371 **Associations of Lack of Insurance and Other Sociodemographic Traits with Deficiencies in Follow-Up After Living Kidney Donation**
K. Lentine[1], R. Hays[2], N. Lam[3], A. Tietjen[4], A. Muiru[5], H. Xiao[1], A. Garg[6], C. Thomas[7], G. McNatt[7], R. Howey[8], U. Lebron-Banks[9], M. Cooper[10], M. Conboy[11], B. Kasiske[11], *[1]Saint Louis Univ, Saint Louis, MO, [2]Univ of Wisconsin, Madison, WI, [3]Univ of Calgary, Calgary, AB, Canada, [4]St. Barnabas, Livingston, NJ, [5]Univ of California, San Francisco, San Francisco, CA, [6]Western Univ, London, ON, Canada, [7]Univ of Iowa, Iowa City, IA, [8]Toyon Associates, Concord, CA, [9]New York Presb Hosp, New York, NY, [10]Medstar-Georgetown, Washington, DC, [11]SRTR, Minneapolis, MN*

372 **Launching a National Living Donor Registry**
J. E. Milton[1], M. Cooper[2], B. Hippen[3], *[1]Transplant Center, University of Texas Health San Antonio, San Antonio, TX, [2]MedStar Georgetown Transplant Institute, Washington, Colombia, [3]Metrolina Nephrology Associates, PA, Charlotte, NC*

373 **CT-measured Cortical Volume Ratio is an Alternative to Nuclear Medicine Split Scan Ratio Among Living Kidney Donors**
J. Montgomery, C. Brown, A. Zondlak, K. Walsh, J. Kozlowski, A. Pinsky, E. Herriman, J. Sussman, Y. Lu, E. Stein, P. Shankar, R. Sung, K. Woodside, *Michigan Medicine, Ann Arbor, MI*

Live Video Question and Answer

Pediatric Kidney

75 **Racial and Ethnic Disparities in Pediatric Kidney Transplantation - Has KAS Made a Difference?**
O. Charnaya[1], S. Yu[2], A. Goldberg[3], J. Garonzik-Wang[2], D. Segev[2], P. Verghese[4], *[1]Pediatrics, Johns Hopkins University, Baltimore, MD, [2]Transplant Surgery, Johns Hopkins University, Baltimore, MD, [3]University of Manitoba, Winninpeg, MB, Canada, [4]Northwestern University Feinberg School of Medicine, Chicago, IL*

76 **Hla Antigens and Recurrence of Focal Segmental Glomerulosclerosis in Pediatric Kidney Transplantation**
B. I. Shaw[1], A. Ochoa[2], C. Chan[2], R. A. Gbadegesin[3], A. M. Jackson[1], E. T. Chambers[3], *[1]Surgery, Duke University, Durham, NC, [2]Biostatistics and Bioinformatics, Duke University, Durham, NC, [3]Pediatrics, Duke University, Durham, NC*

77 **Kidney Paired Donation in Pediatrics: An Underused Opportunity?**
J. Smith[1], M. Skeans[2], R. Engen[3], S. Bartosh[4], *[1]Seattle Children's Hospital, Seattle, WA, [2]SRTR, Minneapolis, MN, [3]Lurie Children's Hospital, Chicago, IL, [4]Univ of Wisconsin, Madison, WI*

78 **Drivers of Graft Failure in Pediatric Kidney Transplant Change Over Time**
E. Benz[1], D. Schaubel[2], S. Amaral[1], *[1]Children's Hospital of Philadelphia, Philadelphia, PA, [2]Department of Biostatistics, Epidemiology, and Informatics, University of Pennsylvania, Philadelphia, PA*

79 **Long Term Safety and Efficacy of Tocilizumab (anti-il6r, Tcz) Therapy in the Treatment of Refractory Chronic Antibody Mediated Rejection (cabmr) in 25 Pediatric Renal Transplant Recipients**
M. Pearl[1], P. Weng[1], A. Dokras[2], H. Pizzo[3], J. Garrison[3], C. Butler[1], J. Q. Zhang[1], K. Lim[3], E. Reed[1], I. Kim[3], M. Haas[3], X. Zhang[3], R. Ettenger[1], S. Jordan[3], D. Puliyanda[3], *[1]Pediatric Nephrology, UCLA Medical Center, Los Angeles, CA, [2]Pediatric Nephrology, UT South Western, Dallas, CA, [3]Pediatric Nephrology, Cedars Sinai Medical Center, West Hollywood, CA*

80 **Leflunomide Therapy for Treatment of Bk Viremia in Pediatric Kidney Transplant Recipients**
A. Aldieri[1], M. Chandran[2], D. Matossian[3], B. Magella[4], D. Lazear[4], M. Bock[2], E. Blanchette[2], *[1]Children's Hospital Colorado, Denver, CO, [2]Children's Hospital Colorado, Aurora, CO, [3]Ann & Robert H. Lurie Children's Hospital of Chicago, Chicago, IL, [4]Cincinnati Children's Hospital Medical Center, Cincinnati, OH*

81 **Risk Factors Predicting Outcomes in Long-Term Pediatric Kidney Transplant Graft Survival**
A. Anand, T. H. Malik, J. Dunson, M. F. McDonald, C. R. Christmann, N. Nguyen Galvan, C. O'Mahony, J. A. Goss, P. R. Srivaths, E. D. Brewer, A. Rana, *Baylor College of Medicine, Houston, TX*

82 **Delayed Graft Function in Pediatric Living Donor Kidney Transplantation**
M. MacConmara, J. Shah, L. de Gregorio, D. Desai, P. Vagefi, C. S. Hwang, *Surgery, UT Southwestern Medical Center, Dallas, TX*

Live Video Question and Answer

Liver

Hemodynamic Consequences of Portal Hypertension Including Kidney Issues

134 **The Rate of Hospitalization Among Patients with Cirrhosis is More Than Twice as High as Patients Over 85 Years**
N. R. Mazumder[1], K. Guo[2], L. Zhao[3], A. Kho[1], K. Walters[4], T. S. Carey[4], C. Loftus[1], D. P. Ladner[1], *[1]Northwestern Memorial Hospital, Chicago, IL, [2]Biostatistics, Northwestern Memorial Hospital, Chicago, IL, [3]Biostatistcs, Northwestern Memorial Hospital, Chicago, IL, [4]University of North Carolina Chapel Hill, Chapel Hill, NC*

135 **A Novel Liver Assist Device as a Bridge to Liver Transplantation in Acute on Chronic Liver Failure Patients with Multi-Organ Failure**

S. Ahmad[1], I. W. Liou[1], J. Reyes[2], R. Bakthavatsalam[3], N. C. Smith[4], R. L. Carithers[1], C. Martin[1], D. Gao[5], *[1]Medicine, University of Washington, Seattle, WA, [2]Surgery, University of Washington, SEATTLE, WA, [3]Surgery, University of Washington, Seattle, WA, [4]Nursing, University of Washington, Seattle, WA, [5]Engineering, University of Washington, Seattle, WA*

136 **Rabbit Anti-thymocyte Globulin Induction is Not Associated with Improved Outcomes in Liver Transplant Recipients**

P. Nguyen, N. Wilson, G. Saracino, R. Patel, S. K. Asrani, G. Testa, T. Sam, *Baylor University Medical Center, Dallas, TX*

137 **Effects of Timing of Everolimus Transition on Renal Outcomes in Liver Transplant Recipients**

M. Leick[1], H. Belleau[2], T. McCashland[3], *[1]Nebraska Medicine, Omaha, NE, [2]Bryan Health, Lincoln, NE, [3]University of Nebraska Medical Center, Omaha, NE*

138 **Machine Perfusion of Kidney Grafts in Simultaneous Liver Kidney Transplantation: National Trends and Outcomes**

A. Chang[1], M. Chen[1], P. Abt[1], T. Bittermann[2], *[1]Surgery, University of Pennsylvania, Philadelphia, PA, [2]Gastroenterology, University of Pennsylvania, Philadelphia, PA*

139 **Outcomes of Transjugular Intrahepatic Portosystemic Shunts (TIPS) in Dialysis-Dependent ESLD Patients: The ALTA Study**

J. Ge[1], J. Boike[2], M. German[3], G. J. Morelli[4], E. Spengler[3], A. Said[3], A. S. Lee[3], A. Hristov[3], A. Desai[5], T. Couri[6], S. Paul[6], C. Frenette[7], N. Christian-Miller[7], M. Laurito[8], E. Verna[8], U. Rahim[9], A. Goel[9], D. Gregory[2], L. VanWagner[2], K. P. Kolli[1], J. Lai[1], *[1]University of California, San Francisco, San Francisco, CA, [2]Northwestern Memorial Hospital, Chicago, IL, [3]University of Wisconsin, Madison, WI, [4]University of Florida Health, Gainsville, FL, [5]Indiana University School of Medicine, Indianapolis, IN, [6]University of Chicago, Chicago, IL, [7]The Scripps Clinic, La Jolla, CA, [8]Columbia University, New York, NY, [9]Stanford University, Stanford, CA*

140 **Home-based Liver Frailty Intervention (lift) in Liver Transplant Candidates: A Pilot Study**

A. J. Thuluvath[1], K. Belfanti[1], S. Morrissey[1], O. Siddiqui[1], J. Peipert[1], A. Daud[1], J. Levitsky[1], T. Bogg[2], A. Flores[1], D. P. Ladner[1], *[1]Northwestern University Transplant Research Collaborative, Chicago, IL, [2]Department of Psychology, Wayne State University, Detroit, MI*

141 **Kidney Transplantation Alone in Patients with Compensated Cirrhosis: A Multicenter Study**

A. Kassem[1], S. Asrani[1], S. W. Biggins[2], Y. Darwish[1], M. Nadim[3], B. Fischbach[1], T. Fong[3], *[1]Baylor University Medical Center at Dallas, Dallas, TX, [2]University of Washington, Seattle, WA, [3]USC - Keck, Los Angeles, CA*

Live Video Question and Answer

Liver Recipient Selection

241 **Pre-Transplant Frailty is Associated with 30-Day Mortality but Not Long-Term Survival After Liver Transplantation**

M. Anderson, V. Valbuena, M. Englesbe, C. Sonnenday, *Department of Surgery, University of Michigan Health System, Ann Arbor, MI*

242 **Relationship of Functional Frailty and Radiographic Sarcopenia to Outcomes After Liver Transplant**

S. L. Olson, P. Polineni, W. Schwartz, O. Siddiqui, L. Zhao, D. Ganger, D. P. Ladner, *Comprehensive Transplant Center, Northwestern University, Chicago, IL*

243 **Comorbidity Burden is Associated with Increased Waitlist Mortality Among NASH Patients**

J. R. Montgomery[1], M. J. Englesbe[1], C. Connelly[2], *[1]Michigan Medicine, Ann Arbor, MI, [2]General Surgery, Oregon Health & Science University, Portland, OR*

244 **Coronary Computed Tomography Angiography for Pre-Liver Transplant Cardiovascular Risk Assessment: A Single Center Experience**

J. Rice[1], T. Genders[2], D. Groves[2], J. R. Burton[1], J. Moloo[2], R. Quaife[2], D. Vargas[3], M. Kriss[1], *[1]Division of Gastroenterology and Hepatology, University of Colorado, Aurora, CO, [2]Division of Cardiology, University of Colorado, Aurora, CO, [3]Division of Radiology, University of Colorado, Aurora, CO*

245 **Recipient Selector for Donation After Cardiac Death Allografts**

G. Handing[1], S. Ganni[2], S. Barrett[1], N. Galvan[2], C. O'Mahony[2], J. Goss[2], R. Cotton[2], A. Rana[2], *[1]School of Medicine, Baylor College of Medicine, Houston, TX, [2]Michael E DeBakey Department of Surgery, Division of Abdominal Transplant, Houston, TX*

246 **Cardiac Risk Assessment in Liver Transplant Candidates: Survey of National Practice Patterns**

P. Barman[1], R. Chadha[2], L. VanWagner[3], *[1]Div. of GI/Hepatology, University of California, San Diego, San Diego, CA, [2]Anesthesiology, Mayo Clinic, Jacksonville, FL, [3]Div. of GI/Hepatology, Northwestern University, Chicago, IL*

247 **Outcomes After Liver Transplantation With Steatotic Grafts: Redefining Acceptable Cutoffs for Moderately Steatotic Grafts**

B. L. Da[1], J. Satiya[2], R. P. Heda[3], Y. Jiang[4], L. Lau[5], A. Fahmy[1], A. Winnick[1], N. Roth[1], E. Grodstein[1], P. J. Thuluvath[6], A. K. Singal[7], T. D. Schiano[8], L. W. Teperman[1], S. K. Satapathy[1], *[1]Liver Disease, Northwell Health, Manhasset, NY, [2]Beth Israel Deaconess Medical Center, Boston, MA, [3]Tulane Medical Center, Memphis, TN, [4]The University of Memphis, Memphis, TN, [5]Northwell Health, Manhasset, NY, [6]University of Maryland School of Medicine, Baltimore, MD, [7]Liver Disease, Avera McKenna University Health Center and Transplant Institute, Manhasset, NY, [8]Icahn School of Medicine at Mount Sinai, New York City, NY*

248 **The Utility of PET/ CT Testing in Cardiac Risk Stratification of Adult Liver Transplant Candidates**

M. A. Tincopa[1], R. Weinberg[1], S. Sengupta[1], J. Slivnick[2], J. Corbett[1], C. Sonnenday[1], R. Fontana[1], P. Sharma[1], *[1]Internal Medicine, University of Michigan, Ann Arbor, MI, [2]Internal Medicine, Ohio State University, Columbus, OH*

Live Video Question and Answer

Liver Transplant Oncology

83 **Outcomes of Downstaging Hepatocellular Carcinoma (HCC) to within Milan Criteria Before Liver Transplantation (LT): A Multicenter Analysis of the "All-comers" Protocol**

B. Natarajan[1], P. Tabrizian[2], M. Hoteit[3], C. Frenette[4], T. Ghaziani[5], R. Dhanasekaran[5], N. Parikh[6], J. Guy[7], A. Shui[1], S. Florman[2], F. Yao[1], N. Mehta[1], *[1]UCSF, SF, CA, [2]Mt Sinai, NY, NY, [3]U Penn, Philadelphia, PA, [4]Scripps, La Jolla, CA, [5]Stanford, Palo Alto, CA, [6]U Michigan, Ann Arbor, MI, [7]CPMC, SF, CA*

84 **Role of Baseline PD-1 Checkpoint Inhibitor Pathway Expression in Bridge to Liver Transplant Hepatocellular Carcinoma**

K. Nunez, T. Sandow, M. Hibino, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

85 **NASH-Related HCC is Associated with Lower Rates of Post-Transplant HCC Recurrence: A Large Database Analysis**

P. J. Altshuler, R. Lamm, K. Patel, H. Dang, O. Shaheen, A. P. Shah, J. Glorioso, C. G. Ramirez, A. M. Frank, W. R. Maley, A. S. Bodzin, *Department of Surgery, Thomas Jefferson University, Philadelphia, PA*

86 **Adjuvant Immunotherapy for Liver Transplant Recipients with Hepatocellular Carcinoma Using Donor Liver-derived Natural Killer Cells**

M. Ohira[1], R. Hotta[1], Y. Imaoka[1], K. Sato[1], N. Tanimine[1], Y. Tanaka[1], S. Nishida[2], A. Tzakis[2], H. Ohdan[1], *[1]Hiroshima University, Hiroshima, Japan, [2]University of Miami, Miami, FL*

87 **T Cell Repertoire Diversity in HCV-Associated Hepatocellular Carcinoma Patients Waitlisted for Liver Transplantation and Receiving Liver-Directed Therapy**

K. Nunez, T. Sandow, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

88 **Living Donor Liver Transplant for Unresectable Colorectal Metastasis: A Case Series**

B. Emmanuel, H. Al-Harakeh, A. Humar, C. Hughes, A. Tevar, M. Molinari, A. Ganoza, *Starzl Transplant Institute, UPMC, Pittsburgh, PA*

89 **Liver Transplantation for Unresectable Colorectal Cancer Liver Metastases: A Multicenter Experience**

L. I. Ruffolo[1], K. Sasaki[2], K. Tomiyama[1], A. Nair[1], M. Orloff[1], B. Al-Judaibi[3], M. Levstik[3], M. Laryea[3], K. Dokus[1], J. Errigo[1], A. Moro[2], C. Quintini[2], K. Hashimoto[2], M. Fujiki[2], K. Menon[2], C. Kwon[2], T. Diago Uso[2], R. Hernandez-Alejandro[1], F. Aucejo[2], *[1]Surgery, University of Rochester Medical Center, Rochester, NY, [2]Surgery, The Cleveland Clinic Foundation, Cleveland, OH, [3]Transplant Hepatology, University of Rochester Medical Center, Rochester, NY*

90 **Outcomes of Liver Transplantation for Combined Hepatocellular Cholangiocarcinoma: A Single-center Experience**

Y. Liu[1], C. Hanlon[1], S. Zhou[1], D. Toy[1], K. King[2], K. Zhou[3], J. Kahn[3], L. Yuan[3], *[1]Internal Medicine, USC Keck School of Medicine, Los Angeles, CA, [2]Radiology, USC Keck School of Medicine, Los Angeles, CA, [3]Internal Medicine - Gastrointestinal and Liver Disease, USC Keck School of Medicine, Los Angeles, CA*

Live Video Question and Answer

Living Donor Liver Transplant and Partial Grafts

35 **Paired Exchanges in LDLT- A Good Option for Patients with Incompatible Donors**

A. Humar, C. Hughes, G. Mazariegos, S. Kyle, A. Gallatin, K. Emmett, A. Tevar, M. Molinari, A. Ganoza, V. Gunabushanam, S. Ganesh, *University of Pittsburgh, Pittsburgh, PA*

36 **Impact of Advanced Renal Dysfunction on Post-Transplant Outcomes After Living Donor Liver Transplantation in the United States**

T. Bittermann[1], N. Kaur[2], P. L. Abt[1], K. M. Olthoff[1], J. K. Heimbach[3], J. Emamaullee[2], *[1]University of Pennsylvania, Philadelphia, PA, [2]University of Southern California, Los Angeles, CA, [3]Mayo Clinic College of Medicine, Rochester, MN*

37 **Impact of Community- Targeted Educational Campaign on Living Donor Transplants**

S. Ganesh, A. Humar, *Transplant, UPMC, Pittsburgh, PA*

38 **Trends in Liver Donors for Liver Transplantation Over Twenty Years: Donor Changes in Gender, Relationships, and Education, but Racial Disparities Remain**

A. Kaplan, B. Fortune, R. Brown, MD, MPH, B. Samstein, K. Halazun, R. Rosenblatt, *Gastroenterology and Hepatology, New York Presbyterian/Weill Cornell, New York, NY*

39 **The Impact of Splenectomy on Living Donor Liver Transplantation Using Small Grafts**
M. Fujiki, E. Aleassa, C. Quintini, F. Aucejo, K. Sasaki, B. Eghtesad, T. Diago, D. Kwon, C. Miller, K. Hashimoto, *Cleveland Clinic Foundation, Cleveland, OH*

40 **Re-Do Hepatic Artery Reconstruction for Thrombosis Can Save Grafts and Patients without Retransplantation: Lessons Learned from 1,355 Adult Living Donor Liver Transplantations**
S. Hong, N. Yi, K. Hong, E. Han, S. Suh, J. Lee, S. Hong, Y. Choi, U. Jin, H. Chang, K. Lee, K. Suh, *Seoul National University Hospital, Seoul, Korea, Republic of*

41 **Death Among Living Liver Donors- Are We Overestimating the Risk?**
H. J. Braun, A. M. Shui, N. L. Ascher, J. P. Roberts, *University of California, San Francisco, San Francisco, CA*

42 **Liver Live Donor Champion: Advocacy Training to Facilitate Identification of Living Liver Donors**
L. R. Herbst, Y. Yu, A. Love, K. Lee, A. Wells, K. Mohr, A. Massie, A. Gurakar, B. King, D. L. Segev, A. M. Cameron, J. Garonzik Wang, *Johns Hopkins University, Baltimore, MD*

Live Video Question and Answer

MELD, Allocation and Donor Issues

181 **Improved Outcomes Over Time of Extended Criteria Donor Grafts for Acute-on-chronic Liver Failure**
T. Kitajima, T. Ivanics, D. Moonka, T. Shamaa, A. Mohamed, K. Delvecchio, K. Collins, M. Rizzari, A. Yoshida, M. Abouljoud, S. Nagai, *Transplant and Hepatobiliary Surgery, Henry Ford Hospital, Detroit, MI*

182 **Impact of Transplant Center Volume on Utilization of and Outcomes Following Donation After Circulatory Death Liver Transplantation in the United States**
S. Kumar[1], S. Lin[2], J. D. Schold[2], *[1]Digestive Disease Institute, Cleveland Clinic Abu Dhabi, Abu Dhabi, United Arab Emirates, [2]Department of Quantitative Health Sciences, Cleveland Clinic Foundation, Cleveland, OH*

183 **The Impact of Donor and Recipient Age Differenceon Long Term Prognosis in Young Liver Transplant Recipients**
A. Pita, A. Moro, J. C. McVey, D. J. Firl, M. Fujiki, T. Diago, C. Quintini, F. Aucejo, C. D. Kwon, K. V. Menon, K. Hashimoto, B. Eghtesad, C. Miller, K. Sasaki, *The Cleveland Clinic, Cleveland, OH*

184 **State-level Trend in the Prevalence of Non-alcoholic Steatohepatitis for Liver Transplant Candidates in the United States, 2001-2017**
S. Chang[1], M. Wang[1], M. Pozo[2], D. Ladner[2], D. Borja-Cacho[2], *[1]Washington University School of Medicine, Saint Louis, MO, [2]Northwestern University, Chicago, IL*

185 **Liver Transplant Justified at Any Meld Score?**
H. Oden-Brunson, E. Godfrey, H. Flores, A. Rana, *Baylor College of Medicine, Houston, TX*

186 **Impact of Graft Quality on Patient Survival in Sick Patients**
G. Handing[1], S. Keeling[1], C. Christmann[1], N. Galvan[2], C. O'Mahony[2], J. Goss[2], R. Cotton[2], A. Rana[2], *[1]School of Medicine, Baylor College of Medicine, Houston, TX, [2]Michael E DeBakey Department of Surgery, Division of Abdominal Transplant, Houston, TX*

187 **Classification of Distinct Patterns of Ischemic Cholangiopathy Following DCD Liver Transplantation: Distinct Clinical Courses and Long-Term Outcomes from a Multicenter Cohort**
K. P. Croome[1], A. K. Mathur[2], B. Aqel[2], L. Yang[1], J. K. Heimbach[3], T. Taner[3], C. B. Rosen[3], R. Paz-Fumagalli[1], C. Taner[1], *[1]Mayo Clinic Jacksonville, Jacksonville, FL, [2]Mayo Clinic Arizona, Scottsdale, AZ, [3]Mayo Clinic Rochester, Rochester, MN*

188 **The Unintended Financial Consequences of Acuity Circles for Liver Allocation - Two-fold Increase in Import Fees and Higher Organ Acquisition Cost Despite Unchanged Travel Patterns**

A. Wall, S. Asrani, G. McKenna, E. Martinez, R. Ruiz, H. Fernandez, J. Bayer, A. Gupta, N. Onaca, R. Goldstein, J. Trotter, G. Testa, *Abdominal Transplant Surgery, Baylor University Medical Center, Dallas, TX*

Live Video Question and Answer

Liver Pediatrics

289 **Pediatric Donation During COVID-19 Pandemic**

M. MacConmara, B. Wang, L. de Gregorio, J. Shah, D. Desai, S. Hanish, P. Vagefi, C. S. Hwang, *Surgery, UT Southwestern Medical Center, Dallas, TX*

290 **The Pediatric National Liver Review Board: What Happens to Waitlist Registrations with Denied Exception Forms?**

J. Foutz[1], C. Martinez[1], A. Henderson[1], E. K. Hsu[2], E. R. Perito[3], J. Heimbach[4], *[1]United Network for Organ Sharing, Richmond, VA, [2]Seattle Children's Hospital, Seattle, WA, [3]UCSF, San Francisco, CA, [4]Mayo Clinic, Rochester, MN*

291 **The Confluence of Race, Socioeconomic Deprivation, and Waitlist Mortality for Children Awaiting Liver Transplant**

S. Wadhwani[1], J. Ge[1], L. Gottlieb[1], C. Lyles[1], A. F. Beck[2], J. Bucuvalas[3], U. Kotagal[2], J. C. Lai[1], *[1]University of California San Francisco, San Francisco, CA, [2]Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [3]Icahn School of Medicine at Mount Sinai, New York, NY*

292 **Clinical Value of Surveillance Biopsies in Pediatric Liver Transplantation: A Single Center Experience with >800 Biopsies**

B. Rocque[1], A. Zaldana[1], C. Weaver[2], J. Huang[1], A. Barbetta[1], V. Shakhin[2], C. Goldbeck[1], G. Yanni[2], R. Kohli[2], Y. Genyk[1], J. Emamaullee[1], *[1]Surgery, University of Southern California Keck School of Medicine, Los Angeles, CA, [2]Pediatrics, Children's Hospital-Los Angeles, Los Angeles, CA*

293 **Degree of T Cell Infiltration Predicts Treatment Response in Pediatric Liver Late Acute Cellular Rejection**

M. Rogers, G. Begum, Q. Sun, A. Peters, *Cincinnati Children's Hospital Medical Center, Cincinnati, OH*

294 **Are All DSA's the Same? Are We Ready for Precision Medicine in Pediatric LT?**

S. E. Shin[1], M. Lee[1], N. Yazigi[2], K. Khan[2], S. Kaufman[2], J. Ahn[3], O. Timofeeva[4], U. Ekong[2], *[1]Georgetown University School of Medicine, Washington, DC, [2]Medstar Georgetown Transplant Institute, Medstar Georgetown University Hospital, Washington, DC, [3]Biostatistics, Bioinformatics, & Biomathematics, Georgetown University, Washington, DC, [4]Histocompatibility Laboratory, Dept. of Pathology & Laboratory Medicine, Georgetown University, Washington, DC*

295 **Center Use of Technical Variant Grafts Impacts Pediatric Liver Transplant Waitlist and Recipient Outcomes in the United States**

G. Mazariegos[1], E. R. Perito[2], J. Squires[1], K. Soltys[1], A. Griesemer[3], S. A. Taylor[4], E. Pahl[5], *[1]Childrens Hosp of Pittsburgh, Pittsburgh, PA, [2]UCSF, San Francisco, CA, [3]Columbia University Irving Medical Center, New York, NY, [4]Lurie Children's Hospital of Chicago, Chicago, IL, [5]Omnilife, Lexington, KY*

296 **Cost Effectiveness Analysis Comparing Treatments of Biliary Strictures in Pediatric Liver Transplant Patients**
B. Whitehead[1], C. Lemoine[2], R. Superina[2], J. Green[3], S. Mohammad[1], *[1]Division of Gastroenterology, Hepatology and Nutrition, Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, IL, [2]Division of Transplant Surgery, Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, IL, [3]Division of Interventional Radiology, Ann and Robert H. Lurie Children's Hospital of Chicago, Chicago, IL*

Live Video Question and Answer

Post Liver Transplant Management and Complications

334 **A Meta-Analysis of Endoscopic Stents in the Treatment of Anastomotic Biliary Strictures After Liver Transplantation**
F. Zhou[1], M. Mieth[1], C. Rupp[2], A. Mehrabi[1], A. Nickkholgh[1], *[1]Department of General, Abdominal and Transplant Surgery, University of Heidelberg, Heidelberg, Germany, [2]Department of Internal Medicine, University of Heidelberg, Heidelberg, Germany*

335 **Effect of Early Biopsy-Proven Rejection on Liver Transplant Outcomes**
D. D. Aufhauser, N. Marka, L. Stalter, G. Levenson, D. Al-Adra, D. P. Foley, *Surgery, University of Wisconsin, Madison, WI*

336 **The Predictive Factors of Survival in Re-listed Patients Who Received Initial Liver Transplants Using Donation After Circulatory Death Grafts**
Y. Fouda, A. Moro, J. Mcvey, D. Firl, M. Fujiki, D. Teresa, F. Aucejo, C. Quintini, C. H. Kwon, K. Hashimoto, B. Eghtesad, K. Narayanan Menon, C. Miller, K. Sasaki, *Cleveland Clinic, Cleveland, OH*

337 **Molecular Assessment of Fibrosis and Steatohepatitis in the INTERLIVER Study**
K. S. Madill-Thomsen[1], P. F. Halloran[1], &. the INTERLIVER Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]AB, Canada*

338 **Predictive Index for Liver Retransplantation**
C. Christmann, G. Handing, M. McDonald, A. Anand, S. Keeling, N. T. Galván, R. Cotton, C. O'Mahony, J. Goss, A. Rana, *Baylor College of Medicine, Houston, TX*

339 **Is There a Role for Donor-Specific Antibody Testing in Simultaneous Liver-Kidney Transplantation? A Single Center Analysis of Outcomes**
A. Das, A. Barbetta, D. Remulla, C. Goldbeck, T. Maw, J. Kim, *University of Southern California, Los Angeles, CA*

340 **High and Low Frequency Domino Liver Transplantation Centers Demonstrate Similar Outcomes**
J. Panichella, H. Resweber, H. Curtis, K. Nguyen, A. Di Carlo, S. Karhadkar, *Temple University School of Medicine, Philadelphia, PA*

341 **Nutritional Inadequacy is an Independent Predictor of Sepsis Post-liver Transplantation**
J. V. Nolte Fong, M. Elshawwaf, L. W. Moore, E. A. Graviss, D. T. Nguyen, R. Angell, A. Uosef, T. Hirase, C. M. Mobley, R. Ghobrial, *Houston Methodist Hospital, Houston, TX*

Acute Rejection

499 **Epigenetic & Functional Changes Associated with Alloreactive Memory CD8 T Cell Subsets in Liver Transplant Patients**
H. Abdelsamed[1], S. Liu[1], M. Juya[1], D. Metes[2], F. Lakkis[1], A. Thomson[1], *[1]University of Pittsburgh Medical Center, Pittsburgh, PA, [2]UPMC, Pittsburgh, PA*

500 **Association Between Donor-Recipient Genetic Matching and Acute Rejection in Kidney Transplantation**
R. Cao[1], V. Arthur[2], J. Chen[2], B. Keating[2], C. Dorr[3], D. Schladt[3], G. Onyeaghala[3], R. Mannon[4], A. Matas[1], R. Remmel[1], N. Pankratz[1], B. Wu[1], W. Oetting[1], P. Jacobson[1], A. Israni[3], W. Guan[1], *[1]University of Minnesota, Minneapolis, MN, [2]University of Pennsylvania, Philadelphia, PA, [3]Hennepin Healthcare Research Institute, Minneapolis, MN, [4]University of Nebraska, Omaha, NE*

501 **Murine Cytomegalovirus Induces Kidney Allograft Injury via Th17 Cells Recruited by Both Viral Antigen-Specific and Cytokine/chemokine Mediated Pathways**

R. Dhital[1], V. Velazquez[1], Q. Zeng[2], B. Graber[1], K. Flint[1], M. Shimamura[1], *[1]Vaccines and Immunity, Nationwide Children's Hospital, Columbus, OH, [2]Center for Cardiovascular Research, Nationwide Children's Hospital, Columbus, OH*

502 **Belatacept-Resistant T Cells are Activated by IFNα-IRF7 Pathway**

F. Herr, K. Bargiel, A. Vernochet, A. Durrbach, *UMR1186, Villejuif, France*

503 **Successful Prophylaxis of Antibody-Mediated Rejection by Downregulation of C5 Expression via RNA Interference in a Rat Kidney Transplant Model**

H. Ishigooka[1], S. Motoi[2], T. Yamakawa[1], C. Matsui[2], Y. Suzuki[3], R. Ishii[1], K. Saiga[1], D. Tokita[1], T. Imai[2], K. Tanabe[1], *[1]Urology, Tokyo Women's Medical University, Tokyo, Japan, [2]KAN Research Institute, Inc., Kobe, Japan, [3]Tsukuba Research Laboratories, Eisai, Co., Ltd., Ibaraki, Japan*

504 **The Microenvironment of Belatacept-Resistant Rejection**

A. Johnson, J. Zhang, C. Larsen, *Surgery, Emory University, Atlanta, GA*

505 **The Efficacy of Delayed Fc-nonbinding Anti-CD3 Antibody Treatment in Sensitized Allogeneic Mouse Heart Transplantation**

T. Ota[1], R. Goto[1], R. Kanazawa[1], K. Shibuya[1], Y. Ganchiku[1], N. Kawamura[2], M. Watanabe[2], M. Fukai[1], T. Shimamura[3], A. Taketomi[1], *[1]Dept. of Gastroenterological Surgery I, Hokkaido University, Sapporo, Japan, [2]Dept. of Transplant Surgery, Hokkaido University, Sapporo, Japan, [3]Division of Organ Transplantation, Hokkaido University Hospital, Sapporo, Japan*

506 **Pharmacokinetic and Toxicity Studies of an Anti CD40L Antibody, At-1501 in Rhesus Macaques**

S. Perrin[1], A. Gill[2], C. Gill[2], F. Vieira[2], K. Thompson[2], *[1]Novus Therapeutics, Irvine, CA, [2]ALS Therapy Development Institute, Cambridge, MA*

507 **Belatacept and Rapamycin Maintenance Immunosuppression in a Sensitized Nonhuman Primate Kidney Allotransplantation Model**

R. Schmitz[1], Z. W. Fitch[1], M. Manook[1], J. Yoon[1], A. B. Farris[2], J. Kwun[1], S. J. Knechtle[1], *[1]Department of Surgery, Duke University Medical Center, Durham, NC, [2]Department of Pathology and Laboratory Medicine, Emory University School of Medicine, Atlanta, GA*

508 **Inhibition of Fatty Acid Beta-Oxidation Prolongs Heart Allograft Survival**

B. W. Wong, Y. Zhu, H. Dun, L. Ye, *Surgery, Washington University School of Medicine, Saint Louis, MO*

509 **Re-Transplantation of Mouse Kidney Grafts to Study Local Immune Responses**

D. Zhao, M. Oberbarnscheidt, F. Lakkis, K. Khodor, *Starzl Transplantation Institution, Pittsburgh, PA*

510 **Invariant Nkt Cells Promote Expansion of Novel $Cxcr3^{+}Ccr4^{+}Cd8^{+}$ T Cells in the Liver Following Allogeneic Hepatocyte Transplant**

J. Zimmerer[1], B. Ringwald[2], S. Chaudhari[1], J. Han[1], C. M. Peterson[1], R. T. Warren[1], M. Hart[1], M. Abdel-Rasoul[3], G. Bumgardner[1], *[1]OSU, Columbus, OH, [2]Medical Student Research Program, OSU, Columbus, OH, [3]Center for Biostatistics, OSU, Columbus, OH*

Antigen Presentation / Allorecognition / Dendritic Cells

511 **Environmental Factors That Shape T-cell Alloimmunity: Role of the Microbiome**

K. Janek[1], J. H. Fechner[1], R. A. Daley[1], K. Krautkamer[1], F. Rey[2], J. D. Mezrich[1], *[1]Surgery, University of Wisconsin School of Medicine & Public Health, Madison, WI, [2]Bacteriology, University of Wisconsin, Madison, WI*

512 **The Development and Characterization of AT1501, an Anti CD40L Antibody Lacking Fc Effector Function**

S. Perrin[1], A. Gill[2], C. Gill[2], F. Vieira[2], K. Thompson[2], J. Lincecum[2], B. Jiang[2], *[1]Novus Therapeutics, Irvine, CA, [2]ALS Therapy Development Institute, Cambridge, MA*

513 **DAP12 Promotes Liver DC Tolerogenicity by Negative Regulation of the CGAS-STING-IFN I Pathway**

Y. Zheng[1], J. Long[2], N. Ryosuke[1], L. Peng[3], F. Peng[3], A. Thomson[1], *[1]Thomas E. Starzl Transplantation Institute, University of Pittsburgh, Pittsburgh, PA, [2]Department of Cardiology, The Second Xiangya Hospital of Central South University, Changsha, China, [3]Department of Kidney Transplantation, The Second Xiangya Hospital of Central South University, Changsha, China*

B-cell / Antibody /Autoimmunity

514 **Lung Transplant Recipients Developing Early DSAs are Characterized by a Shift Towards Memory B Cells Directly After Transplantation**

S. Christoph[1], A. Hitz[1], R. Bellmàs Sanz[1], J. Kühne[1], B. Wiegmann[2], F. Ius[2], J. Salman[2], E. Chichelnitskiy[1], T. Siemeni[2], W. Sommer[3], A. Haverich[2], G. Warnecke[3], C. Falk[1], *[1]Institute of Transplant Immunology, MHH, Hannover, Germany, [2]Department of Cardiothoracic, Transplant and Vascular Surgery, MHH, Hannover, Germany, [3]Department of Cardiac Surgery, University Hospital Heidelberg, Heidelberg, Germany*

515 **Autoantibodies Against Ro/SS-A, CENP-B, and La/SS-B are Increased in Patients with Kidney Allograft Antibody-mediated Rejection**

S. Clotet-Freixas[1], M. Kotlyar[2], C. M. McEvoy[1], C. Pastrello[2], S. Rodríguez-Ramírez[1], S. Farkona[1], H. Cardinal[3], M. Dieudé[3], M. Hébert[3], Y. Li[1], O. Famure[1], P. Chen[1], S. Kim[1], E. Chan[4], I. Jurisica[2], R. John[1], A. Chruscinski[1], A. Konvalinka[1], *[1]Toronto General Hospital Research Institute, University Health Network, Toronto, ON, Canada, [2]Krembil Research Institute, University Health Network, Toronto, ON, Canada, [3]Centre de Recherche du Centre Hospitalier de l'Université de Montréal, Montreal, QC, Canada, [4]Department of Medicine, Division of Nephrology, University Health Network, Toronto, ON, Canada*

516 **Properties of Regulatory B Cells Suppressing B Cells**

Q. Fu[1], K. Lee[2], K. Deng[2], G. Huai[2], C. Rickert[2], H. Yang[1], C. LeGuern[2], S. Deng[1], J. F. Markmann[2], *[1]Organ Transplantation Center, Sichuan Provincial People's Hospital, University of Electronic Sciences and Technology of China, Chengdu, China, [2]Center for Transplantation Sciences, MGH, Boston, MA*

517 **Autoimmune Responses to DNA Topoisomerase I Exacerbate Renal Allograft Injury**

V. Gorbacheva, R. Fan, S. Miyairi, W. Baldwin, R. Fairchild, A. Valujskikh, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

518 **Donor-specific Regulatory B Cells Prolong Skin Graft Survival by Preventing the Proliferation of Donor-specific CD4 Helper but Not of CD8 Effector T Cells**

G. Huai[1], K. Lee[2], K. Deng[2], Q. Fu[1], C. G. Rickert[2], S. Deng[1], C. LeGuern[2], J. F. Markmann[2], *[1]Department of Organ Transplantation Center, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China, [2]Center for Transplantation Sciences, Massachusetts General Hospital, Harvard Medical School, Boston, MA*

519 **In Vitro Generated Regulatory B Cells Induce $Cd4^{+}Cd25^{+}Foxp3^{+}$Tregs from $Cd4^{+}Cd25^{-}$T Cells via TGF-β**

G. Huai[1], K. Lee[2], K. Deng[2], Q. Fu[1], C. G. Rickert[2], S. Deng[1], C. LeGuern[2], J. F. Markmann[2], *[1]Department of Organ Transplantation Center, Sichuan Provincial People's Hospital, University of Electronic Science and Technology of China, Chengdu, China, [2]Center for Transplantation Sciences, Massachusetts General Hospital, Harvard Medical School, Boston, MA*

520 **Quantifying Hidden Sensitization: HLA-reactive Memory B Cells in the Spleens of Sensitized Women**
J. T. Killian[1], J. A. Houp[1], A. Nellore[2], R. G. King[3], P. M. Porrett[1], F. E. Lund[3], *[1]Department of Surgery, University of Alabama at Birmingham School of Medicine, Birmingham, AL, [2]Department of Medicine, University of Alabama at Birmingham School of Medicine, Birmingham, AL, [3]Department of Microbiology, University of Alabama at Birmingham School of Medicine, Birmingham, AL*

521 **Suppression of T Cell Proliferation by Activated Nonhuman Primate B Cells**
K. Lee, K. Deng, G. Huai, F. Qiang, C. Rickert, J. Lei, C. Leguern, J. Markmann, *Massachusetts General Hospital, Boston, MA*

522 **Targeting Il-21 Receptor Shifts Tfh/tfr Balance and Amelioratеschronic Antibody Mediated Rejection**
Y. Nian, Z. Xiong, J. Zhao, Y. Fu, *Tianjin First Central Hospital, Tianjin, China*

523 **Antibodies to Hla Molecules Lead to Induction and Release of Circulating Exosomes with Lung Self-Antigens**
R. Ravichandran, M. Smith, R. Bremner, T. Mohanakumar, *St. Joseph's Hospital and Medical Center, Phoenix, AZ*

524 **Development of a Rat Model of Antibody-Mediated Rejection After Liver Transplantation**
T. Tajima, K. Hata, J. Kusakabe, H. Miyauchi, S. Uemoto, *Dept. of Surgery, Div. of HBP Surgery & Transplantation, Kyoto University Graduate School of Medicine, Kyoto, Japan*

525 **A Novel Mouse Model of Cardiac Allograft Vasculopathy**
H. Tsuda[1], E. Reed[2], W. Baldwin[1], R. Fairchild[1], *[1]Inflammation and Immunity, Cleveland Clinic, Cleveland, OH, [2]Pathology and Laboratory Medicine, University of California, Los Angeles, CA*

526 **Iguratimod Prevents Antibody-mediated Rejection by Regulating Germinal Center Formation and Antibody Production**
H. Zhang, A. Chandraker, P. Sage, N. Murakami, *Transplantation Research Center, Brigham and Women's Hospital, Boston, MA*

Biomarker Discovery and Immune Modulation

544 **Hypoxia Inducible Factor 1á (HIF-1á) Regulates Carcinoembryonic Antigen-related Cell Adhesion Molecule-1 (CEACAM1) Splice Isoforms to Protect Against Ischemic Injury in Mouse and Human Liver Transplantation**
K. J. Dery, H. Kojima, K. Kadono, H. Hirao, J. W. Kupiec-Weglinski, *The Dumont-UCLA Transplantation Center, Los Angeles, CA*

545 **Microbial Signatures Promote Antibiotic-Mediated Alleviation of Peritransplant Liver Damage in Mouse Recipients**
K. J. Dery[1], S. Kageyama[1], H. Hirao[1], H. Kojima[1], K. Kadono[1], T. Dong[2], J. W. Kupiec-Weglinski[1], *[1]The Dumont-UCLA Transplantation Center, Los Angeles, CA, [2]Department of Medicine, Vatche & Tamar Manoukian Division of Digestive Diseases, UCLA, Los Angeles, CA*

546 **Neutrophil CEACAM1 Induces Hepatic Autophagy and Shapes Innate-adaptive Immune Response in Liver Transplantation: From Mouse-to-human**
H. Hirao[1], H. Kojima[1], K. Kadono[1], K. J. Dery[1], K. Nakamura[2], D. G. Farmer[1], F. M. Kaldas[1], J. W. Kupiec-Weglinski[1], *[1]Surgery, Dumont-UCLA Transplant Center, Los Angeles, CA, [2]Surgery, Kyoto University, Kyoto, Japan*

547 **Treg Lymphotoxin Engages Lymphotoxin Receptor on Cancer and Endothelial Cells to Promote Cancer Metastatic Migration: Mechanisms for Treg-Cancer Interactions**
W. Piao, R. Oakes, C. Paluskievicz, J. Christopher, J. Bromberg, *U Maryland, Baltimore, MD*

548 **Development of a Lateral Flow Assay Detecting CXCL9 within Antibody Mediated and Acute T Cell Mediated Rejections After Kidney Transplantation**

L. K. Seiler[1], R. Jonczyk[1], P. Lindner[1], L. Phung[1], C. Falk[2], C. Blume[1], *[1]Faculty of Natural Sciences, Institute of Technical Chemistry, Hannover, Germany, [2]Institute of Transplant Immunology, Medical School Hannover, Hannover, Germany*

550 **Novel Morphologic Biomarkers of Cardiac Allograft Remodeling are Associated with Multiple Peri- and Post-transplant Inflammatory Processes**

C. Yuan[1], S. Arabyarmohammadi[1], H. Li[1], E. Peyster[2], P. Lal[3], M. Feldman[3], K. Margulies[2], A. Madabhushi[1], *[1]Department of Biomedical Engineering, Case Western Reserve University, Cleveland, OH, [2]Cardiovascular Research Institute, University of Pennsylvania, Philadelphia, PA, [3]University of Pennsylvania, Philadelphia, PA*

LB 28 **Urinary Exosomal Cystatin C and Lipopolysaccharide Binding Protein as Biomarkers for Monitoring Antibody-mediated Rejection After Kidney Transplantation**

M. Kim, S. Lim, S. Shin, *Department of Surgery, Asan Medical Center, University of Ulsan College of Medicine, Seoul, Korea, Republic of*

Biomarkers, Immune Assessment and Clinical Outcomes

624 **Cardiac Outcomes in Isolated Heart and Simultaneous Kidney and Heart Transplants in the US**

K. A. Agarwal[1], H. Patel[1], N. Agrawal[1], F. Cardarelli[1], N. Goyal[2], *[1]Nephrology, Beth Israel Deaconess Medical Center, Boston, MA, [2]Nephrology, Tufts Medical Center, Boston, MA*

625 **Nrf2 Assessment in Discarded Liver Allografts: A Role in Allograft Function and Salvage**

O. Ahmed, M. Xu, F. Zhou, A. N. Wein, G. Upadhya, Y. Lin, W. Chapman, *Surgery, Washington University School of Medicine, Saint Louis, MO*

626 **Biomarkers of Kidney Injury and Repair in Expanded-Criteria Deceased Donor Kidney Transplant Recipients: A Prospective Study**

A. Al Jurdi[1], O. Efe[1], B. Aoyama[2], M. Lima[2], H. Silva[2], I. Schmidt[3], S. Waikar[3], V. Sabbisetti[4], L. V. Riella[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital, Charlestown, MA, [2]Escola Paulista de Medicina, UNIFESP, São Paulo, Brazil, [3]Boston Medical Center, Boston, MA, [4]Brigham and Women's Hospital, Boston, MA*

627 **Remote Monitoring Using Mobile Phlebotomy and Donor-derived Cell-free DNA in Kidney Transplant Recipients During the Covid-19 Pandemic**

N. Ali[1], J. Miles[2], V. Tatapudi[1], R. Montgomery[1], *[1]NYU Langone, New York, NY, [2]Medical Science Liason, CareDx, Brisbane, CA*

628 **Longitudinal Variance of Donor Derived Cell Free DNA (dd-cf DNA) in Stable Kidney Transplant (Tx) Patients are Influenced by Donor/Recipient Variables**

S. Anand, F. Lopez-Verdugo, J. Sanchez-Garcia, L. Dong, M. Fife, J. Krong, D. Morris, T. Srinivas, *Intermountain Medical Center, Murray, UT*

629 **Longitudinal Surveillance, Relative Change Value (RCV) Improve Diagnostic Test Accuracy (DTA) of Donor-Derived Cell Free DNA (dd-cfDNA)**

S. Anand, F. Lopez-Verdugo, J. Sanchez-Garcia, L. Dong, M. Fife, J. Krong, D. Morris, T. Srinivas, *Intermountain Medical Center, Murray, UT*

630 **Evaluation of Meningococcal Vaccine Response Among Solid Organ Transplant Recipients Receiving Eculizumab**

R. Arora[1], C. Kane[1], K. Cunningham[1], M. Ison[2], *[1]Pharmacy, Northwestern Memorial Hospital, Chicago, IL, [2]Divisions of Infectious Diseases and Organ Transplantation, Northwestern Memorial Hospital, Chicago, IL*

631 **Single Center Experience Comparing Two Clinically Available Donor Derived Cell Free DNA Tests**

S. Bunnapradist[1], S. Lee[2], P. Homkrailas[3], G. Danovitch[3], *[1]UCLA, Los Angeles, CA, [2]Pharmacy, David Geffen School of Medicine at UCLA, Los Angeles, CA, [3]David Geffen School of Medicine at UCLA, Los Angeles, CA*

632 **Comparative Proteomics Analysis Identifies the Biomarker of Ischemia-Reperfusion Injury During Liver Transplantation**

M. Chen[1], L. Xiaohong[2], H. Xitao[1], J. Weiqiang[1], *[1]Transplant Center, Sun Yat-sen University, Guangzhou, China, [2]Sun Yat-sen University, Guangzhou, China*

633 **Association of Immune Cell Markers with Adverse Outcomes in the First 6 Months Post-pediatric Heart Transplantation**

J. Chen[1], D. Salerno[2], H. Corbo[1], S. Shah[3], A. Rothkopf[4], I. D. Lytrivi[4], *[1]Department of Pharmacy, Columbia University Irving Medical Center, New York, NY, [2]Department of Pharmacy, Weill Cornell Medical Center, New York, NY, [3]College of Pharmacy and Health Sciences, St. John's University, Queens, NY, [4]Pediatric Cardiology, Columbia University Irving Medical Center, New York, NY*

634 **Impact of Deceased Donor Mode of Death and Kidney Donor Profile Index on Baseline Donor Derived Cell Free DNA in Kidney Transplant Recipients**

B. Chopra, A. Grazier, K. K. Sureshkumar, *Allegheny Health Network, Pittsburgh, PA*

635 **Gene Expression Profiles Assessed by the Nanostring nCounter® Platform May Differentiate Different Types of Rejection, and Importantly, T-Cell Mediated Rejection from BK Virus Nephropathy**

K. R. Degner[1], K. J. Swanson[1], S. Parajuli[1], D. Mandelbrot[1], N. Garg[1], F. Aziz[1], M. Mohamed[1], W. Zhong[1], L. Ptak[1], N. A. Wilson[1], R. Woodward[2], A. Djamali[1], *[1]University of Wisconsin, Madison, WI, [2]CareDx, Inc., San Francisco, CA*

636 **Combined Donor Derived Cell Free DNA (AlloSure) and Peripheral Immune Cell Gene Expression (AlloMap) Testing for the Diagnosis of Rejection in Kidney Transplant Recipients with De Novo Donor Specific Antibodies**

K. R. Degner, S. Parajuli, F. Aziz, N. Garg, D. Mandelbrot, M. Mohamed, K. Van Hyfte, S. R. Reese, N. A. Wilson, A. Djamali, *University of Wisconsin, Madison, WI*

637 **Renal Tubular-cell-specific Urinary Extracellular Vesicles: A Novel Biomarker for Diabetic Nephropathy After Kidney Transplantation**

N. Eguchi[1], H. Lau[1], F. Zaldivar[2], U. G. Reddy[3], E. Tantisattamo[3], A. Ferrey[3], D. Dafoe[1], H. Ichii[1], *[1]Surgery, University of California Irvine, Orange, CA, [2]Pediatric Execise and Genomics Research Center, University of California Irvine, Irvine, CA, [3]Medicine, University of California Irvine, Orange, CA*

638 **Should We Worry About Covid-19 Infection in Pediatric SOT?**

U. Ekong[1], S. Paul[1], S. Royal[2], J. Chahine[3], N. Yazigi[1], S. Kaufman[1], K. Khan[1], C. Matsumoto[1], A. Kroemer[1], T. Fishbein[1], *[1]Surgery, Medstar Georgetown Transplant Institute, Washington, DC, [2]Pediatrics, Medstar Georgetown University Hospital, Washington, DC, [3]Pathology and Laboratory Medicine, Medstar Georgetown University Hospital, Washington, DC*

639 **Urinary Exosome Mrna Signature for the Diagnosis of Human Kidney Transplant Rejection**

R. El Fekih[1], J. Hurley[2], V. Tadigotla[2], A. Alghamdi[3], A. Srivastava[4], C. Coticchia[2], J. Choi[1], H. Allos[5], k. yatim[5], J. Alhaddad[5], S. Eskandari[5], P. Chu[5], A. Mihali[5], I. Lape[5], M. Lima Filho[5], B. Ayoma[5], A. Chandraker[5], K. Safa[6], J. Markmann[6], L. Riella[6], R. Formica[7], J. Skog[2], J. Azzi[5], *[1]Medecine, Brigham and Women Hospital, Boston, MA, [2]Exosome Diagnostics, Boston, MA, [3]Boston Children Hospital, Boston, MA, [4]Center for Translational Metabolism and Health, Chicago, IL, [5]Transplantation Research Center, Boston, MA, [6]Massachusetts General Hospital, Boston, MA, [7]Yale School of Medicine, New Haven, CT*

640 **Intraoperative Fluid Management and Kidney Transplantation Outcomes: A Retrospective Review**

M. W. Harbell[1], M. B. Kraus[1], S. A. Buckner Petty[2], J. W. Harbell[3], *[1]Anesthesiology and Perioperative Medicine, Mayo Clinic, Phoenix, AZ, [2]Biostatistics, Mayo Clinic, Phoenix, AZ, [3]Transplant Surgery, Mayo Clinic, Phoenix, AZ*

641 **Real-time Donor-derived Cell-free Dna Kinetics Indicate Decreased "Molecular Injury" During Treatment of Acute Renal Allograft Rejection**

R. Hinojosa[1], K. M. Hitchman[2], D. J. Ross[3], R. C. Hall[1], J. E. Nelson[1], E. L. Kincaide[1], K. Klein[1], A. M. Bell[3], *[1]Pharmacotherapy Education and Research Center | Long School of Medicine, UT Health San Antonio | University Transplant Center, University Health, San Antonio, TX, [2]Long School of Medicine, UT Health San Antonio | University Transplant Center, University Health, San Antonio, TX, [3]CareDx, Inc., Brisbane, CA*

642 **The Impact of Maintenance Immunosuppression Withdrawal on Sensitization Status After Renal Graft Failure**

R. Hod Dvorai, A. Almonte, C. Hubbell, M. Laftavi, R. Shahbazov, R. Saidi, O. Pankewycz, J. Leggat, M. Hanlon, B. Gallay, *SUNY Upstate Medical University, Syracuse, NY*

643 **Outcomes of Novel Coronavirus 2019 in Solid Organ Transplant Recipients: Yet Again, Race and Payor Status Matters**

C. Huang[1], M. Hemmersbach-Miller[1], M. Goss[2], N. Moreno[3], A. Rana[1], J. Goss[1], N. Galvan[1], *[1]General Surgery, Baylor College of Medicine, Houston, TX, [2]General Surgery, University of Texas Health Science Center at Houston, Houston, TX, [3]General Surgery, McGovern Medical School, Houston, TX*

644 **A Reliable Non Invasive Alternative to Surveillance Renal Allograft Biopsy**

R. Jain, S. Thaduri, V. Kumar, C. Kew, B. Julian, G. Towns, S. Ong, F. Ahmed, S. Mehta, G. Agarwal, *Transplant Nephrology, University of Alabama Birmingham, Birmingham, AL*

645 **Characteristics, Risk Factors, and Outcomes of Neutropenia for the First Year After Liver or Kidney Transplantation in Children**

C. Jarasvaraparn[1], S. Choudhury[2], C. Rusch[2], K. Liss[1], J. Stoll[1], S. Hmiel[3], S. Kulkarni[1], *[1]Pediatric Gastroenterology, Washington University School in St Louis, Saint Louis, MO, [2]Pediatric, Washington University School in St Louis, Saint Louis, MO, [3]Pediatric Nephrology, Washington University School in St Louis, Saint Louis, MO*

646 **Leukopenia in the Renal Transplant Population**

A. Johnson[1], G. Karadkhele[2], C. Larsen[1], *[1]Emory University, Atlanta, GA, [2]Surgery, Emory University, Atlanta, GA*

648 **Incidence of Pancreatic Exocrine Insufficiency in Patients Undergoing Liver Transplantation**

J. Klein[1], M. Rangel[1], I. Ifearulundu[1], Y. Gely[1], Z. Spigel[2], S. Janardhan[3], M. Hertl[1], E. Chan[1], *[1]Surgery, Rush University Medical Center, Chicago, IL, [2]Surgery, Allegheny Health Network, Pittsburgh, PA, [3]Hepatology, Rush University Medical Center, Chicago, IL*

649 **De Novo Donor Specific Antibodies After Heart Transplantation in Fontan Patients with Protein Losing Enteropathy**

D. A. Magnetta[1], V. Hoch[2], D. Pinelli[3], M. Monge[4], E. Pahl[1], P. T. Thrush[1], *[1]Pediatric Cardiology, Lurie Children's Hospital, Chicago, IL, [2]Northwestern School of Medicine, Chicago, IL, [3]Department of Surgery, Northwestern University Feinberg School of Medicine, Chicago, IL, [4]Pediatric Cardiothoracic Surgery, Lurie Children's Hospital, Chicago, IL*

650 **Brain Natriuretic Peptide and Pedometer Activity are Most Predictive of Poor Kidney Transplant Waitlist Outcomes**

P. Manay[1], P. TenEyck[2], R. Kalil[3], M. Sanders[4], M. Swee[4], G. Binns[5], J. Hornikel[5], D. Katz[1], *[1]Department of Surgery, University of Iowa, Iowa City, IA, [2]Institute for Clinical and Translational Science, University of Iowa, Iowa City, IA, [3]Department of Medicine, University of Maryland Medical Center, Baltimore, MD, [4]Department of Medicine, University of Iowa, Iowa City, IA, [5]Iowa City VAMC, Iowa City, IA*

651 **The Assesment of Pre-transplant Donor-reactive IL-21 Producing T Cells as a Tool to Identify Patients at Risk for Acute Rejection**

A. Mendoza Rojas[1], T. van Gelder[2], R. de Kuiper[1], D. Reijerkerk[1], M. C. Clahsen-van Groningen[3], D. A. Hesselink[1], C. C. Baan[1], N. M. van Besouw[1], *[1]Internal Medicine, Neprology & Transplantation, Erasmus Medical Center, Rotterdam, Netherlands, [2]Department of Clinical Pharmacy & Toxicology, Leiden University Medical Center, Leiden, Netherlands, [3]Internal Medicine, Pathology, Erasmus Medical Center, Rotterdam, Netherlands*

652 **Immunosuppression is Not Associated with High-risk Immunologic Parameters in Transplant Recipients with the Sars-cov2 Virus**

S. Merl, R. Jones, B. Shonts, D. Rust, M. Sykes, J. Weiner, *Medicine/Surgery, Columbia University Medical Center, New York, NY*

653 **Endothelial Glycocalyx Shedding is Associated with Graft Quality During Ex Vivo Lung Perfusion**

K. Noda, B. J. Philips, T. Harano, J. D. Luketich, P. G. Sanchez, *Department of Cardiothoracic Surgery, University of Pittsburgh, Pittsburgh, PA*

654 **Hla-dq Epitope Mismatch Predicts De Novo Donor-Specific Antibody Formation and Acute Cellular Rejection After Living Donor Liver Transplantation**

K. Ono, K. Ide, Y. Tanaka, M. Ohira, H. Tahara, N. Tanimine, S. Akimoto, Y. Imaoka, K. Sato, H. Yamane, N. Tsukiyama, R. Ide, T. Mochizuki, H. Ohdan, *Department of Gastroenterological and Transplant Surgery, Graduate School of Biomedical and Health S, Hiroshima University, Hiroshima City, Japan*

655 **Dietary Intake and Mycophenolate Mofetil-related Diarrhea Following Kidney Transplantation**

G. Onyeaghala[1], L. Teigen[2], B. Guo[2], Y. Doronin[1], M. Al-Kofahi[2], B. Wu[2], W. Guan[2], C. Staley[2], S. Riad[2], A. Matas[2], R. Remmel[2], W. Oetting[2], C. Dorr[1], P. Jacobson[2], A. Israni[1], *[1]Nephrology, Hennepin Healthcare Research Institute, Minneapolis, MN, [2]University of Minnesota, Minneapolis, MN*

656 **Comparison of Donor-derived Cell Free Dna Between Recipients with First Solitary Allograft and Regrafts**

S. Paluri[1], S. Muthusamy[1], M. Shinbashi[1], G. Gupta[1], B. Dale[2], Z. Kashi[3], P. Halloran[4], D. Kumar[1], *[1]Virginia Commonwealth University, Richmond, VA, [2]CareDx, Brisbane, CA, [3]Kashi Clinical Laboratories, Portland, OR, [4]ATAGC, Edmonton, AB, Canada*

657 **Dysregulation of Immune Cell Glycolysis and Oxidative Phosphorylation Correlates with Development of Pre-liver Transplant Immune Dysfunction and Post-transplant Mortality**

G. Panayotova[1], L. Jin[1], A. Lemenze[1], S. Simonishvili[1], Y. Qin[1], L. Minze[2], G. Dikdan[1], F. Paterno[1], X. C. Li[2], M. Ghobrial[2], J. V. Guarrera[1], K. E. Lunsford[1], *[1]Transplant Surgery, Rutgers NJMS, Newark, NJ, [2]Transplant Surgery, Houston Methodist Hospital, Houston, TX*

658 **Kidney Graft Biopsy for Indication Proteinuria: Finding, and Outcomes**

S. Parajuli, K. Swanson, J. Alstott, F. Aziz, N. Garg, W. Zhong, A. Djamali, D. Mandelbrot, *University of Wisconsin, Madison, WI*

659 **Initial Experience with Trugraf™ Gene Expression Profile and Trac™ Dd-cfdna Testing in Kidney Transplant Recipients Suggests Synergy and Enhanced Management within the First Year Post-transplant and Beyond**

V. Paramasivam, B. Greco, M. Germain, *Nephrology, Baystate Medical Center, Springfield, MA*

660 **Blood Gene Expression and Donor-derived Cell Free DNA for Diagnosing Subclinical Acute Rejection in Stable Kidney Transplant Recipients**

S. Park[1], K. Guo[2], H. Raymond[3], E. Poggio[4], D. Taber[5], C. Marsh[6], S. Kurian[7], S. Kleiboeker[8], J. Weems[8], J. Holman[9], L. Zhao[2], R. Sinha[8], S. Brietigam[2], C. Rebello[2], M. Abecassis[10], J. Friedewald[1], *[1]Transplant Nephrology, Northwestern University, Chicago, IL, [2]Feinberg School of Medicine, Northwestern University, Chicago, IL, [3]Mayo Clinic College of Medicine and Science, Phoenix, AZ, [4]Department of Nephrology and Hypertension, Cleveland Clinic, Cleveland, OH, [5]Division of Transplant Surgery, Medical University of South Carolina, Charleston, SC, [6]Department of Medicine and Surgery, Scripps Clinic and Green Hospital, La Jolla, CA, [7]Scripps Health, La Jolla, CA, [8]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [9]Transplant Genomics, Inc, Mansfield, MA, [10]University of Arizona College of Medicine, Tucson, AZ*

661 **Immunosuppression Impacts Panel Reactive Antibody Status in Second Solid Organ Transplant Recipients - A Single Center Experience**

J. Patel[1], S. Ali[2], M. L. Sanders[1], C. P. Thomas[1], D. Axelrod[1], M. Bilal[3], E. H. Field[3], S. Kuppachi[1], *[1]University of Iowa Hospitals & Clinics, Iowa city, IA, [2]Louis A. Johnson VA Medical Center, Clarksburg, WV, [3]Iowa City VA Health Care System, Iowa city, IA*

662 **Continuation of Immunosuppression After the First Renal Allograft Failure Impacts Panel Reactive Antibody Status During Subsequent Renal Transplantation**

J. Patel[1], S. Ali[2], M. L. Sanders[3], C. P. Thomas[3], D. Axelrod[3], M. Bilal[4], E. H. Field[4], S. Kuppachi[3], *[1]University of Iowa Hospitals & Clinics, Iowa CIty, IA, [2]Louis A. Johnson VA Medical Center, Clarksburg, WV, [3]University of Iowa Hospitals & Clinics, Iowa City, IA, [4]Iowa City VA Health Care System, Iowa City, IA*

663 **Donor-Derived Cell-Free DNA Performance Characteristics are Similar for Repeat and Primary Kidney Transplant Recipients**

V. R. Peddi[1], S. Akkina[2], S. C. Jordan[3], W. Tian[4], Y. Qazi[5], *[1]California Pacific Medical Center, San Francisco, CA, [2]Loyola University Medical Center, Maywood, IL, [3]Cedars-Sinai Medical Center, Los Angeles, CA, [4]CareDx, Brisbane, CA, [5]University of Southern California, Los Angeles, CA*

664 **The Role of the B2 Microglobulin Trend in Patients with Delayed Graft Function After Kidney Transplant**

A. Perez-Gutierrez, P. J. Bachul, B. Juengel, P. Witkowski, D. DiSabato, R. Barth, J. Fung, Y. Becker, *Surgery, University of Chicago, Chicago, IL*

665 **Does the Timing of Subclinical Acute Rejection After Kidney Transplant Matter?**

P. Portocarrero[1], S. Park[2], K. Guo[3], L. Zhao[3], J. Friedewald[2], *[1]Nephrology, Northwestern University, Chicago, IL, [2]Transplant Nephrology, Northwestern University, Chicago, IL, [3]Feinberg School of Medicine, Northwestern University, Chicago, IL*

666 **GENiE in a Bottle - Renasight Testing in the Kidney Transplant Setting - A Single Center Experience**

Y. A. Qazi[1], W. Mon[1], N. Ioannou[2], M. Smogorzewski[1], *[1]Keck Medical Center at USC, Los Angeles, CA, [2]Natera, San Carlos, CA*

667 **Role of Trugraf Testing in Kidney Allografts Previously Biopsied for Dysfunction**

Y. A. Qazi[1], W. Mon[1], C. Choi[1], S. Qazi[2], M. Smogorzewski[1], *[1]Keck Medical Center at USC, Los Angeles, CA, [2]Keck Medical Center at USC, La Canada Flt, CA*

668 **Tru and Sure -A Tale of Two Cities! Can Allosure Predict and Enhance Trugraf Results?**

Y. A. Qazi[1], W. Mon[1], S. Qazi[2], C. Choi[1], M. Smogorzewski[1], *[1]Keck Medical Center at USC, Los Angeles, CA, [2]Keck Medical Center at USC, La Canada Flt, CA*

669 **Core Signature of Rejection-Specific Cytokines and Chemokines in Heart Biopsies After Transplantation**

L. M. Radomsky[1], Y. Scheibner[2], J. F. Kuehne[1], J. Keil[1], K. Beushausen[1], K. Ludmilla[2], A. Schick[2], F. Ius[2], G. Warnecke[3], C. Bara[2], C. S. Falk[1], *[1]Institute of Transplant Immunology, Hannover Medical School, Hannover, Germany, [2]Department of Cardiothoracic, Transplantation and Vascular Surgery, Hannover Medical School, Hannover, Germany, [3]Clinic for Cardiac Surgery, University of Heidelberg, Heidelberg, Germany*

670 **Analysis of Single Cell RNA Sequencing Data to Define Biomarkers of Human Liver Immune Tolerance**

B. Rocque[1], A. Barbetta[1], P. Singh[1], C. Goldbeck[1], D. G. Helou[2], E. Loh[3], N. Ung[4], J. S. Lee[4], O. Akbari[2], J. Emamaullee[1], *[1]Surgery, University of Southern California Keck School of Medicine, Los Angeles, CA, [2]Molecular Microbiology and Immunology, University of Southern California, Los Angeles, CA, [3]Norris Medical Library, University of Southern California Keck School of Medicine, Los Angeles, CA, [4]Ellison Institute, University of Southern California, Los Angeles, CA*

671 **Kidney Injury in Hematopoietic Cell Transplant (HCT) Recipients: Urinary Biomarkers to the Rescue**

T. Salinas[1], C. Snopkowski[1], C. Li[1], K. Chen[1], M. Lubetzky[1], S. Salvatore[1], K. Van Besien[1], E. Jaimes[2], S. Hingorani[3], S. Seshan[1], T. Muthukumar[1], *[1]NY Presbyterian- Weill Cornell Medical College, New York, NY, [2]Memorial Sloan Kettering Cancer Center, New York, NY, [3]University of Washington School of Medicine, Seattle, WA*

672 **Nonadherence Post-kidney Transplant is Associated with Increased Immune Activation Detected by Peripheral Blood Gene Expression Assay**

N. Singh[1], A. Palermini[1], M. S. Naseer[1], T. Le[1], S. Tandukar[1], D. Aultman[2], H. Shokouh-Amiri[2], G. Zibari[2], *[1]Transplant, John C. McDonald Regional Transplant Center - Willis Knighton Health System, Shreveport, LA, [2]Advanced Surgery, John C. McDonald Regional Transplant Center - Willis Knighton Health System, Shreveport, LA*

673 **Trugraf Gene Expression Testing Can Discriminate Rejection in the Setting of Acute Kidney Injury**

N. Singh[1], M. S. Naseer[1], D. Aultman[2], H. Shokouh-Amiri[2], G. Zibari[2], *[1]Nephrology, John C. McDonald Regional Transplant Center - Willis Knighton Medical Center, Shreveport, LA, [2]Advanced Surgery, John C. McDonald Regional Transplant Center - Willis Knighton Medical Center, Shreveport, LA*

675 **Analysis of the Difference of the Monitoring Results of Tcr High Variable Area in Renal Transplant Recipients After Treatment with Different Immune Induction Schemes**

P. Tian, F. Han, M. Dou, B. Zheng, G. Deng, X. Ding, W. Xue, *The First Affiliated Hospital of Xi'an Jiaotong University, Xi'an, China*

676 **Donor Derived Cell-free-dna (dd-cfdna) as a Surrogate Marker for Kidney Biopsy- Indiana University Transplant Nephrology Experience**

S. Valavoor[1], A. Sharfuddin[2], G. William[3], M. Yaqub[1], D. Mishler[1], O. Adebiyi[2], *[1]Nephrology, Indiana University, Indianapolis, IN, [2]Transplant Nephrology, Indiana University, Indianapolis, IN, [3]Transplant Surgery, Indiana University, Indianapolis, IN*

677 **Evaluation of Serum Klotho Levels at Early Kidney Post-Transplant**

T. Vazquez-Sanchez[1], J. Alonso-Titos[1], M. Sánchez-Niño[2], E. Sola[1], M. Leon[3], V. Lopez[1], P. Ruiz-Esteban[1], E. Porrini[4], A. Ortiz[5], D. Hernández[1], *[1]Nephrology, Instituto de Investigación Biomédica de Málaga (IBIMA). Hospital Universitario Regional de Málaga and University of Málaga. REDinREN (RD16/0009/0006). Málaga. (Spain), Malaga, Spain, [2]Nephrology, Instituto de Investigación-Sanitaria de la FundaciónJiménez Díaz,UniversidadAutónoma de Madrid. REDINREN, Madrid, Spain, [3]Pathology, Instituto de Investigación Biomédica de Málaga (IBIMA). Hospital Universitario Regional de Málaga and University of Málaga. REDinREN (RD16/0009/0006). Málaga. (Spain), Malaga, Spain, [4]Nephrology, Hospital Universitario de Canarias, CIBICAN, Universidadde laLaguna, REDinREN (RD16/0009/0031) Tenerife e Instituto Reina Sofía de Investigación Renal (IRSIN), Malaga, Spain, [5]Nephrology, Instituto de Investigación-Sanitaria de la FundaciónJiménez Díaz,UniversidadAutónoma de Madrid. REDINREN, Malaga, Spain*

678 **Is Subclinical Allograft Rejection by 2019 Banff Criteria Associated with Worse Kidney Allograft Outcomes? Comparison Between 2007 and 2019 Banff Criteria**

M. T. Victor[1], S. Park[2], K. Guo[1], L. Zhao[1], J. Friedewald[3], *[1]Feinberg School of Medicine, Northwestern University, Chicago, IL, [2]Transplant Nephrology, Northwestern Univeristy, Chicago, IL, [3]Transplant Nephrology, Northwestern University, Chicago, IL*

679 **Long-term Outcomes of Early Steroid Withdrawal (SW) After Kidney Transplant**

D. Vock[1], A. Matas[2], *[1]University of Minnesota School of Public Health, Minneapolis, MN, [2]University of Minnesota Medical School, Minneapolis, MN*

680 **Identification and Validation of a Prognostic Index for Renal Allograft Survival Based on the Geo Database**

X. Zhang, Z. Wang, Z. Han, J. Tao, X. Ju, R. Tan, M. Gu, *The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

681 **Nomogram of Quantity of Peripheral $Cxcr5^{+}Cd8^{+}$ T Cells, Aims to Predict Risk of De Novo Dsa in First-time Kidney Transplant Recipients**

J. Zimmerer[1], M. Abdel-Rasoul[2], G. Bumgardner[1], *[1]OSU, Columbus, OH, [2]Center for Biostatistics, OSU, Columbus, OH*

LB 29 **Torque Teno Virus Load Predicts Allograft Rejection but Not Viral Infection After Kidney Transplantation; A Cohort Joint Modelling Study**

A. L. van Rijn[1], H. F. Wunderink[2], I. A. Sidorov[1], C. S. de Brouwer[1], A. C. Kroes[1], H. Putter[3], A. P. de Vries[4], J. I. Rotmans[4], M. C. Feltkamp[1], *[1]Medical Microbiology, Leiden University Medical Center, Leiden, Netherlands, [2]Medical Microbiology, University Medical Center Utrecht, Utrecht, Netherlands, [3]Medical Statistics, Leiden University Medical Center, Leiden, Netherlands, [4]Internal Medicine, Leiden University Medical Center, Leiden, Netherlands*

LB 30 **Cellular and Genetic Signatures of Operational Tolerance in Kidney Transplant Recipients Through Single Cell R N A Sequencing Analysis**

H. BAE[1], H. Lee[2], J. Ryu[3], B. Chung[2], E. Oh[3], *[1]Department of Biomedical Science, Graduate School, College of medicine, The Catholic university of Korea, Seoul, Seoul, Korea, Republic of, [2]Department of Internal Medicine, Division of Nephrology, College of Medicine, Seoul St. Mary's hospital, the Catholic University of Korea, Seoul, Korea, Republic of, [3]Department of Laboratory Medicine, College of medicine, The Catholic university of Korea, Seoul, Seoul, Korea, Republic of*

LB 31 **Estimated GFR by Serum Myo-inositol, Valine, Creatinine, and Cystatin-c Outperforms Current CKD-epi Equations in Renal Transplant Recipients**

J. W. Meeusen[1], F. Stammler[2], J. Lieske[3], M. Grassi[2], M. Shah[4], E. Schiffer[2], *[1]Cardiovascular Laboratory Medicine, Mayo Clinic, Rochester, MA, [2]Research and Development, Numares, Boston, MA, [3]Division of Nephrology and Hypertension, Mayo Clinic, Rochester, MN, [4]Clinical Research, Numares, Boston, MA*

LB 32 **AlloMap Kidney Gene Expression Profiling Discriminates Rejection from Immuno-Quiescence in Renal Transplant Recipients**

E. Akalin[1], A. Djamali[2], H. Xu[3], X. Jin[3], R. N. Woodward[3], S. Dholakia[3], J. S. Bromberg[4], *[1]Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, NY, [2]University of Wisconsin, Madison, WI, [3]CareDx, Brisbane, CA, [4]University of Maryland School of Medicine, Baltimore, MD*

LB 33 **Precision Medicine in Renal Transplantation: T-cell Repertoire Sequencing to Define Donor-specific Clones for Post-transplant Monitoring**

K. R. Sherwood[1], P. Wong[1], F. Fenninger[1], V. Wu[1], J. Beckrud[2], D. P. Cina[3], L. Allan[2], J. Lan[2], P. A. Keown[2], *[1]University of British Columbia, Vancouver, BC, Canada, [2]Vancouver General Hospital, Vancouver, BC, Canada, [3]Urologic Sciences, Vancouver General Hospital, Vancouver, BC, Canada*

Cellular Therapies, Tissue Engineering/ Regenerative Medicine

527 **Transgenic Beta-cell Cxcl12 Expression and Stem Cell Mobilization Synergize to Suppress Type 1 Diabetes**

D. A. Alagpulinsa, A. Jajoo, M. H. Chapin II, M. C. Poznansky, *Vaccine & Immunotherapy Center, Massachusetts General Hospital and Harvard Medical School, Boston, MA*

528 **Versatile Strategy to Enhance Nanomedicine Delivery to Graft Endothelial Cells**

C. Albert[1], L. G. Bracaglia[1], A. Koide[2], J. DiRito[1], T. Lysyy[1], C. Edwards[1], J. T. Langford[1], D. Haakinson[1], S. A. Hosgood[3], M. L. Nicholson[3], J. S. Pober[1], W. M. Saltzman[1], S. Kiode[2], G. Tietjen[1], *[1]Yale University, new haven, CT, [2]Perlmutter Cancer Center, New York University, Langone Medical Center, New York, NY, [3]University of Cambridge, Cambridge, United Kingdom*

529 **Single Cell RNA Sequencing Reveals a Global Increase in Inflammatory Gene Signature Following Normothermic Ex Vivo Liver Perfusion**

K. Carlson, J. Pavan-Guimaraes, B. Verhoven, J. Verhagen, F. Najmabadi, D. P. Al-Adra, *Surgery, University of Wisconsin, Madison, WI*

530 **Patterns and Inhibition of Cell Death During Static Cold Storage of Human Kidneys**

J. R. DiRito[1], G. Chickering[2], J. T. Langford[1], D. Stern[1], S. Hosgood[3], M. L. Nicholson[3], E. Gavathiotis[4], R. N. Kitsis[5], M. Saltzman[2], J. S. Pober[6], G. T. Tietjen[7], *[1]Surgery, Yale School of Medicine, New Haven, CT, [2]Biomedical Engineering, Yale University, New Haven, CT, [3]Surgery, University of Cambridge, Cambridge, United Kingdom, [4]Biochemistry and Medicine, Wilf Family Cardiovascular Research Institute, Albert Einstein College of Medicine, Bronx, NY, [5]Surgery, Albert Einstein College of Medicine, Bronx, NY, [6]Immunobiology, Yale University, New Haven, CT, [7]Surgery and Biomedical Engineering, Yale School of Medicine, New Haven, CT*

531 **Ectopic Hepatocyte Transplantation Into the Lymph Nodes in a Fully Mismatched Allogeneic Dog Model Using Tacrolimus and Prednisone**

P. A. Fontes, *NA, LyGenesis, Pittsburgh, PA*

533 **The Hepatoprotective Role of Innate Lymphoid Cells in Liver Transplantation**

H. Kojima, H. Hirao, H. Zhang, K. Kadono, K. J. Dery, Y. Zhai, J. Kupiec-Weglinski, *The Dumont-UCLA Transplantation Center, Los Angeles, CA*

534 **Pathways and Factors That Confer Therapeutic Properties of Adipose Derived Regenerative Cells in Reducing Ischaemia Reperfusion Injury in Kidney Transplantation**
R. Lathan, P. Mark, M. Clancy, R. Touyz, *Institute of Cardiovascular and Medical Sciences, University of Glasgow, Glasgow, United Kingdom*

535 **Lacripep™-like Peptide N-104 Promotes Beta Cell Proliferation in Murine Pancreatic Islets**
M. Ma, P. Chhabra, K. Fread, K. Dias Teixeira, G. Laurie, K. Brayman, *University of Virginia Health System, Charlottesville, VA*

537 **Platelets Stimulate Liver Regeneration After Partial Liver Transplantation**
K. Takahashi, C. Liang, K. Furuya, T. Oda, *GI and HBP Surgery, University of Tsukuba, Tsukuba, Japan*

538 **The Tumor-suppressor Signaling of the α1-na/k-atpase- Cav-1-src Complex at the Caveola in Nash Related Hepatocellular Carcinoma**
U. S. Udoh[1], J. D. Sanabria[1], M. Banerjee[1], P. K. Rajan[1], M. Schade[1], J. A. Sanabria[1], A. Mallick[1], G. Smith[1], G. U. Udoh[2], K. Sodhi[1], S. Pierre[2], Z. Xie[2], J. Shapiro[2], J. Sanabria[1], *[1]Dept. of Surgery/ Marshall Institute for Interdisciplinary Research, Marshall University, Huntington,, WV, [2]Marshall Institute for Interdisciplinary Research, Marshall University, Huntington,, WV*

539 **Human Liver-derived Mesenchymal Stromal Cells (MSC) are Superior Inhibitors of Natural Killer Cells Compared to Bone Marrow or Adipose Tissue-derived MSC**
F. Yigitbilek, M. J. Hansen, W. D. Park, M. D. Stegall, T. Taner, *Mayo Clinic, Rochester, MN*

Endothelial Cell Biology

540 **Src Kinase Inhibitor Pp1 Blunts Tgf-β1 Dependent Endothelial-to-Mesenchymal Transition to Alleviate Allograft Kidney Fibrosis Through Orchestrating β-catenin Signaling**
Z. Gui, Z. Wang, Z. Han, J. Tao, X. Ju, R. Tan, M. Gu, *Urology, The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

541 **Extracellular Vesicles from Patients with Diabetic Nephropathy Induce Endothelial Dysfunction Through Icam-1 and Vcam-1 in an In Vitro Model**
E. Montagud-Marrahi[1], S. Torramadé-Moix[2], M. Ramirez-Bajo[3], J. Rovira[3], E. Bañón-Maneus[3], E. Hermida[1], F. Diekmann[1], M. Palomo[4], M. Díaz-Ricart[2], P. Ventura-Aguiar[1], *[1]Nephrology and Kidney Transplantation Department, Hospital Clínic de Barcelona, Barcelona, Spain, [2]Hematopathology Department, Hospital Clínic de Barcelona, Barcelona, Spain, [3]Nephrology and Transplant Experimental Laboratory (LENIT), Hospital Clínic de Barcelona, Barcelona, Spain, [4]Josep Carreras Leukaemia Research Institute, Hospital Clínic de Barcelona, Barcelona, Spain*

542 **HLA I Antibody-Activated Endothelium Polarized M2-Like Macrophages with Increased Efferocytic and Phagocytic Capacity**
J. Nevarez-Mejia[1], X. Wei[1], N. M. Valenzuela[1], M. Rossetti[1], H. Pickering[1], G. A. Fishbein[1], A. Mulder[2], E. F. Reed[1], *[1]Pathology and Laboratory Medicine, UCLA, Los Angeles, CA, [2]Immunohematology and Blood Transfusion, LUMC, Leiden, Netherlands*

543 **IFNγ, and to a Lesser Extent TNFα, Elicits Protracted Endothelial Cell Expression of Costimulatory Molecules and Antigen Presentation Machinery**
N. M. Valenzuela, *Pathology and Laboratory Medicine, UCLA, Los Angeles, CA*

Histocompatibility and Immunogenetics

579 Anti-HLA-DP Antibodies Positive - A Retrospective Review of Outcomes in Renal Transplantation- Single Centre Experience

O. Piscoran[1], J. Worthington[2], R. Dhillon[1], T. Augustine[1], M. Picton[1], M. Morton[1], S. Bhutani[1], *[1]Urology, Renal and Transplantation, Manchester University NHS Foundation Trust, Manchester, United Kingdom, [2]Transplantation Laboratory, Manchester University NHS Foundation Trust, Manchester, United Kingdom*

580 Disparities in HLA Representation by Single Antigen Reagents in Different Ethnic Populations

J. C. Quon[1], J. Menteer[2], N. Fotiadis[2], R. M. Lestz[2], L. A. Baxter-Lowe[2], *[1]Keck School of Medicine of USC, Los Angeles, CA, [2]Children's Hospital Los Angeles, Los Angeles, CA*

581 HLA Mismatching and Subclinical Inflammation: An Association to be Considered in Kidney Transplant Patients with Low Immunological Risk

T. Vazquez-Sanchez[1], J. Alonso-Titos[1], P. Ruiz-Esteban[1], A. Caballero[2], M. Leon[3], V. Lopez[1], E. Sola[1], D. Hernández[1], *[1]Nephrology, Instituto de Investigación Biomédica de Málaga (IBIMA). Hospital Universitario Regional de Málaga and University of Málaga. REDinREN (RD16/0009/0006). Málaga. (Spain), Málaga, Spain, [3]Pathology, Instituto de Investigación Biomédica de Málaga (IBIMA). Hospital Universitario Regional de Málaga and University of Málaga. REDinREN (RD16/0009/0006). Málaga. (Spain), Málaga, Spain*

582 The Co-Occurrence of Newly Developed HLA Donor Specific Antibody and Positive C3d/C4d Profiles Along with Immune Therapy Non-Compliance in Pediatric Heart Transplant Recipients is a High Risk Indicator for Patient Mortality

A. Zhang, C. Nasman, J. Allen, Y. Sun, D. Thomas, R. Rodriguez, C. Tan, G. Boyle, *Cleveland Clinic Foundation Transplant Center, Cleveland, OH*

Immunosuppression Preclinical Studies

583 Transforming Growth Factor-Beta Induced Myeloid-Derived Suppressor Cells Promote Transplant Immune Tolerance

F. Zhang, *Department of Urology, Beijing Chaoyang Hospital, Capital Medical University, Beijing, China, Beijing, China*

Innate Immunity; Chemokines, Cytokines, Complement

551 Adjuvant Treatment Shapes the Bone Marrow Myeloid Compartment Towards an Immunosuppressive Phenotype That Can Suppress Allograft Rejection

J. Ge[1], E. Anderson[1], J. F. Markmann[2], A. Cuenca[1], *[1]Surgery, Boston Children's Hospital, Boston, MA, [2]Surgery, Massachusetts General Hospital, Boston, MA*

552 Donor Kidney-Resident Macrophages Promote Allograft Inflammation and CD8 T Cell Response Post-Transplantation

A. Dangi[1], S. Yu[2], I. Husain[1], R. Geesala[1], X. Luo[1], *[1]Nephrology, Medicine, Duke University, Durham, NC, [2]Division of Organ Transplantation, The First Affiliated Hospital of Sun Yat-sen University, Guangzhou, China*

553 Portal Hypertension Abrogates Trail Expression of Liver Resident Nk Cells via Il-33

Y. Imaoka, M. Ohira, K. Sato, H. Ohdan, *Hiroshima Uni., Hiroshima, Japan*

554 **Taurodeoxycholic Acid and L-valine Ameliorate Macrophage Driven Alloimmunity in Obese Transplant Recipients**
M. Quante[1], J. Iske[1], D. Perkins[2], M. Alegre[3], H. Zhou[1], A. Elkhal[1], S. G. Tullius[1], *[1]Department of Surgery, Brigham and Women's Hospital, Boston, MA, [2]University of Illinois at Chicago, Chicago, IL, [3]Department of Medicine, The University of Chicago, Chicago, IL*

555 **Recipient Neutrophils Producing Myeloperoxidase Provoke Nk Cell and Monocyte/macrophage Activation During Acute Antibody-mediated Rejection of Kidney Allografts**
D. Ueda, S. Miyairi, K. Keslar, W. M. Baldwin, R. L. Fairchild, *Lerner Research Institute, Cleveland Clinic, Cleveland, OH*

LB 34 **CHBP Induces Stronger Immunosuppressive CD127^{+} M-MDSC via Erythropoietin Receptor**
C. Yang, *Urology, Zhongshan Hospital, Fudan University, Shanghai, China*

LB 35 **Influence of Immunosuppressive Drug Trough Levels on Nk Cells in Liver Transplantation**
R. Qin[1], J. Qin[2], C. Sun[3], B. Nashan[1], *[1]Clinic for Organ Transplantation, The First Affiliated Hospital of the University of Science and Technology of China, Hefei, China, [2]Clinic for Organ Transplantation, The First Affiliated Hospital of the University of Science and Technology of China., Hefei, China, [3]Division of Life and Medicine, University of Science and Technology of China, Hefei, China*

LB 36 **Naïve Rhesus Monkey CD4^{+}CD8^{lo}T Cells Comprise High Percentage of Memory T Cells with Strong Effector Function**
M. Kubo, K. Sasaki, A. P. Gutiérrez, L. Lu, V. Vujevich, A. W. Thomson, M. Ezzelarab, *Department of Surgery, University of Pittsburgh, PITTSBURGH, PA*

Ischemia Reperfusion & Organ Rehabilition

595 **MiRNA as Regulator of Cell Death and Inflammatory Response in Hepatic Iri**
E. Bardhi[1], T. Rousselle[1], J. McDaniels[1], S. Bontha[1], J. Eason[2], D. Maluf[1], V. Mas[3], *[1]Surgery, University of Maryland, Baltimore, MD, [2]Surgery, James D Eason Transplant Institute, Memphis, TN, [3]Surgery, University of Maryland - Division of Surgical Science, Baltimore, MD*

596 **Spleen Tyrosine Kinase (syk): A Novel Regulator of Neutrophil Infiltration in Hepatic Iri**
V. Boominathan, A. Kobayashi, S. Duarte, A. Zarrinpar, *Surgery, University of Florida, Gainesville, FL*

597 **Sampling Renal Biopsies in Pre-Clinical Research for Comprehensive Assessment**
C. M. Edwards[1], C. Albert[2], D. Stern[1], J. Langford[1], W. Day[2], J. R. DiRito[1], W. M. Saltzman[2], M. Kashgarian[3], J. S. Pober[4], G. T. Tietjen[1], *[1]Surgery, Yale School of Medicine, New Haven, CT, [2]Biomedical Engineering, Yale School of Medicine, New Haven, CT, [3]Pathology, Yale School of Medicine, New Haven, CT, [4]Immunobiology, Yale School of Medicine, New Haven, CT*

598 **Indocyanine Green Fluorescence Imaging Allows Quantification of Ischemic Injury During Porcine Normothermic Ex Situ Perfusion**
T. Goto, Y. Noguchi, S. Ganesh, L. Mazilescu, T. Reichman, N. Selzner, M. Selzner, *Ajmera Transplant Program, Department of Surgery, Toronto General Hospital, Toronto, ON, Canada*

599 **The Harmful Effect of Retained Peripheral Cells During Flushing and Static Cold Storage in Rat Liver Normothermic Machine Perfusion**
O. Haque[1], C. A. Pendexter[2], J. F. Markmann[2], K. Uygun[2], H. Yeh[2], S. N. Tessier[2], *[1]Surgery, Beth Israel Deaconess Medical Center, Boston, MA, [2]Massachusetts General Hospital, Boston, MA*

600 **Thrombolytic Therapy During Ex-Vivo Normothermic Machine Perfusion of Human Livers Reduces Peribiliary Vascular Plexus Injury**

O. Haque[1], S. Raigani[2], I. Rosales[2], C. Carroll[2], T. M. Coe[2], S. Baptista[2], H. Yeh[2], K. Uygun[2], J. F. Markmann[2], *[1]Surgery, Beth Israel Deaconess Medical Center, Boston, MA, [2]Massachusetts General Hospital, Boston, MA*

601 **Sigma-1 Receptor Agonists are Renoprotective in Experimental Kidney Transplantation**

A. Hosszu[1], T. Lakat[1], A. Toth[1], D. Balogh[1], J. Hodrea[1], L. J. Wagner[2], A. J. Szabo[1], A. Fekete[1], *[1]1st Department of Pediatrics, Semmelweis University, Budapest, Hungary, [2]Department of Transplantation and Surgery, Semmelweis University, Budapest, Hungary*

602 **An Immune-modulatory Strategy to Mitigate Hepatic Ischemia/reperfusion Injury in a Murine Model**

A. Kobayashi, A. Wanchoo, S. Farhadi, J. Simonovich, S. Duarte, V. Boominathan, S. Shrestha, G. Hudalla, B. G. Keselowsky, A. Zarrinpar, *University of Florida, Gainesville, FL*

603 **Nanodiamond-doxorubicin Complexes Improve Hepatic Ischemia/reperfusion Injury**

A. Kobayashi, C. Grady, S. Duarte, V. Boominathan, S. Shrestha, A. Zarrinpar, *Surgery, University of Florida, Gainesville, FL*

604 **Hepatic Ferroptosis in Cold Stress and Warm Ischemia-reperfusion: A Novel Therapeutic Target in Liver Transplantation**

H. Kojima[1], H. Hirao[1], K. Kadono[1], T. Ito[1], K. J. Dery[1], S. Kageyama[2], K. Nakamura[3], F. M. Kaldas[1], D. G. Farmer[1], J. W. Kupiec-Weglinski[1], *[1]UCLA Medical Center, Los Angeles, CA, [2]Kyoto University, Kyoto, Japan, [3]Nishi-Kobe Medical Center, Kyoto, Japan*

605 **Augmented Responses of Donor Kidney Tubular Cells to TLR Signaling Correlate with Ameliorated Ischemia/reperfusion Injury and Long-term Allograft Protection**

X. Lai[1], J. Wang[1], L. Qiu[2], S. Han[1], K. Shen[1], Z. Zhang[1], *[1]Comprehensive Transplant Center, Microsurgery core, Northwestern University, Chicago, IL, [2]University of California, San Francisco, San Francisco, CA*

606 **Caspase-3 is a Predominant Regulator of Microvascular Dysfunction and Aki-ckd Transition Post Renal Ischemia-reperfusion Injury**

S. Lan, F. Migneault, J. Turgeon, M. Bourgault, M. Dieudé, N. Patey, H. Cardinal, M. Hébert, *CRCHUM, University of Montreal, Montreal, QC, Canada*

607 **Combining Oxygenated Cold Perfusion with Normothermic Ex-vivo Perfusion Improves the Outcome of DCD Porcine Kidney Transplantation**

L. I. Mazilescu[1], T. Goto[1], R. Rosales[1], Y. Noguchi[1], P. Urbanellis[1], L. A. Robinson[2], M. Selzner[1], *[1]Ajmera Transplant Program, Toronto General Hospital, Toronto, ON, Canada, [2]Department of Nephrology, The Hospital for Sick Children, Toronto, ON, Canada*

608 **Tubastatin-a Mediated Protection from Liver Injury is Preserved in a Lymphocyte Deficient Model**

C. S. O'Brien[1], P. Hernandez[1], Z. Wang[1], G. Ge[1], A. Kozikowski[2], W. Hancock[1], M. H. Levine[1], *[1]University of Pennsylvania, Philadelphia, PA, [2]University of Illinois at Chicago, Chicago, IL*

609 **Effect of Defibrotide on Kidney Ischemia Reperfusion Injury in a Preclinical Renal Transplant Model**

P. Pine[1], Z. Sun[2], A. Matas[3], J. Shi[1], A. Ebrahimnejad[1], M. Zanette[4], P. Halloran[5], J. S. Bromberg[6], R. Hanvesakul[7], *[1]Jazz Pharmaceuticals, Palo Alto, CA, [2]Johns Hopkins Medicine, Baltimore, MD, [3]Univ of Minnesota, Minneapolis, MN, [4]Jazz Pharmaceuticals, Philadelphia, PA, [5]Univ of Alberta, Edmonton, AB, Canada, [6]Univ of Maryland School of Medicine, Baltimore, MD, [7]Jazz Pharmaceuticals, Oxford, United Kingdom*

610 **Composition of Ex Vivo Lung Perfusion Solutions and Kinetics Define Differential Cytokine and Chemokine Secretion in a Porcine Cardiac Arrest Model of Lung Preservation**

L. M. Radomsky[1], A. Koch[2], C. Olbertz[2], J. F. Kuehne[1], Y. Liu[2], J. Keil[1], K. Beushausen[1], U. Rauen[3], C. S. Falk[1], M. Kamler[2], *[1]Institute of Transplant Immunology, Hannover Medical School, Hannover, Germany, [2]Thoracic Transplantation, Department of Thoracic and Cardiovascular Surgery, University Hospital Essen, Essen, Germany, [3]Institute of Physiological Chemistry, University Hospital Essen, Essen, Germany*

611 **Inhibition of Apoptosis During Ex Situ Liver Normothermic Machine Perfusion Decreases Reperfusion Injury and Improves Viability**

S. Raigani[1], S. Baptista[1], A. Ohman[2], J. Santiago[2], I. Rosales[1], M. Heaney[2], J. Boylan[2], T. Coe[1], K. Uygun[1], J. Sanders[2], H. Yeh[1], *[1]Transplant Surgery, Massachusetts General Hospital, Boston, MA, [2]Pediatric Endocrinology, Brown University, Providence, RI*

612 **The Contribution of Disulfide-hmgb1 Released During Ischemia-reperfusion Injury to Pro-inflammatory Macrophage Polarization Following Liver Transplantation**

A. Q. Terry, R. A. Sosa, M. Rossetti, J. Nevarez-Mejia, B. V. Naini, F. Kaldas, V. Groysberg, S. Younan, R. Busuttil, D. W. Gjertson, J. W. Kupiec-Weglinski, E. Reed, *Pathology and Lab Medicine, UCLA, Los Angeles, CA*

613 **Myeloid YAP-HSF1 Signaling Inhibits NLRP3 Function and RIPK3-mediated Hepatocyte Necroptosis in Liver Ischemia and Reperfusion Injury**

Y. Tian, D. Xu, M. Sheng, Y. Zhan, Y. Lin, C. Li, A. J. Coito, R. W. Busuttil, D. G. Farmer, J. W. Kupiec-Weglinski, B. Ke, *Surgery, Dumont - UCLA Transplant Ctr, Los Angeles, CA*

614 **Single-cell Rna Sequencing of Latent Murine Cytomegalovirus Infected Lung Transplants**

L. A. VanOsdol[1], S. Han[1], M. Kandpul[2], J. J. Wang[1], L. Qiu[3], Z. J. Zhang[1], *[1]Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]Department of Surgery, Northwestern University, Chicago, IL, [3]School of Medicine, University of California, San Fransisco, San Fransisco, CA*

615 **Galectin-3 Blockade Can Decrease Reperfusion Injury in Response to Ischemia in a Rat Hind Limb Transplant Model**

Z. Wang[1], Y. Wang[1], D. Yoeli[1], B. Li[1], A. Su[1], D. Mathes[1], K. Washington[1], E. Farkash[2], C. A. Huang[1], *[1]University of Colorado, Aurora, CO, [2]University of Michigan, Ann Arbor, Ann Arbor, MI*

616 **Mitochondrial Transplant Minimizes Liver Ischemia Reperfusion Injury in Lean and Obese Mice**

C. Watkins[1], G. Lamanilao[1], C. Kuscu[1], C. Kuscu[1], J. F. Pierre[2], J. Eason[1], A. Bajwa[1], *[1]Transplant Research Institute, James D. Eason Transplant Institute, Department of Surgery, The University of Tennessee Health Science Center, Memphis, TN, [2]Department of Pediatrics - Divisions of Neonatology and Pediatric Obesity, The University of Tennessee Health Science Center, Memphis, TN*

617 **Characterization of Kidney Small Extracellular Vesicles Released During Normothermic Machine Perfusion**

W. W. Woud[1], A. Arykbaeva[2], D. de Vries[2], I. Alwayn[2], K. Boer[1], C. Baan[1], M. Hoogduijn[1], R. Minnee[3], *[1]Internal Medicine, Nephorology and Transplantation, Erasmus MC, Rotterdam, Netherlands, [2]Department of Surgery, LUMC, Leiden, Netherlands, [3]Department of Surgery, Division of Hepato-Pancreato-Biliary and Transplant Surgery, Erasmus MC, Rotterdam, Netherlands*

618 **Myeloid Yap Signaling is Required for Hepatic Cytoprotection in Liver Ischemia-reperfusion Injury**

B. Yang[1], Z. Xue[1], C. Zhang[2], Y. Zhang[2], Y. Liu[2], J. Kupiec-Weglinski[1], H. Ji[1], *[1]Dumont-UCLA Transplant Center, Los Angeles, CA, [2]Dept of Surgery, Zhejiang University, Hangzhou, China*

619 **The Inflammatory Response in the Context of Tissue Injury: Roles of Tyro3, Axl, and Mer (TAM) Receptor Tyrosine Kinases in Liver Ischemia/ reperfusion Injury**
J. Zhang[1], H. Zhang[1], M. Ni[2], R. Busuttil[1], J. Kupiec-Weglinski[1], Y. Zhai[1], *[1]Dumont-UCLA Transplant Center, Los Angeles, CA, [2]Liver Suyrgery, The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

620 **Glycogen Synthase Kinase 3 Beta Regulates Distinctive Macrophage Subsets in the Activation and Resolution of Liver Ischemia Reperfusion Injury**
H. Zhang[1], M. Ni[2], J. Zhang[1], H. Wang[2], R. Busuttil[1], J. Kupiec-Weglinski[1], Y. Zhai[1], *[1]Dumont-UCLA Transplant Center, Los Angeles, CA, [2]The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

621 **Normothermic-Hyperthermic Machine Perfusion Could Increase Response to Pharmacological Intervention in Mitigation of Liver Steatosis**
F. Zhou, M. Xu, G. A. Upadhya, Y. Lin, W. C. Chapman, *Surgery, Washington University in St. Louis, St. Louis, MO*

LB 38 **Identification and Comprehensive Validation of Prognostic Genes After Ischemic and Reperfusion Injury Across Different Donor Types in Renal Transplantation**
D. Zhang, Y. Wang, Y. Wang, X. Hu, *Department of Urology, Beijing Chao-Yang Hospital, Capital Medical University, Beijing, China*

Islet Cell and Cell Transplantation

584 **Islet Isograft Transplantation Improves Insulin Sensitivity in a Murine Model of Type 2 Diabetes**
S. Lim, M. Choi, M. Kim, Y. Wee, H. Kwon, C. Jung, Y. Kim, D. Han, S. Shin, *Asan Medical Center, Seoul, Songpa, Korea, Republic of*

585 **Lacripep™-like Peptide N-104 Increases Insulin Secretion and Promotes Islet Transplantation Outcomes**
M. Ma, P. Chhabra, K. Dias Teixeira, G. Laurie, K. Brayman, *University of Virginia Health System, Charlottesville, VA*

586 **A Small Molecule Inhibitor of Toll-like Receptor-4 TAK-242 Attenuates IBMIR Against Human Islets**
J. Mattke[1], S. Vasu[1], K. Kumano[1], Y. Liu[1], C. M. Darden[1], M. C. Lawrence[1], R. R. Kane[2], B. Naziruddin[1], *[1]Baylor University Medical Ctr, Dallas, TX, [2]Baylor University, Waco, TX*

587 **Bone Marrow-Derived Mesenchymal Stem Cells Improve Rat Islet Graft Revascularization by Upregulating Isl1**
W. Ying, J. Wang, X. Ding, *Kidney Transplantation, The First Affiliated Hospital of Xi'an Jiaotong University, Xi An, China*

Lymphocyte Biology: Signaling, Co-Stimulation, Regulation

556 **Effects of IL-18 on Key Post-Translational Modifications of Human Foxp3 and Innate Immunity**
T. Akimova[1], L. M. Christensen[1], Z. Wang[2], M. H. Levine[2], W. W. Hancock[1], *[1]CHOP & University of Pennsylvania, Philadelphia, PA, [2]University of Pennsylvania, Philadelphia, PA*

557 **The Absence of T Follicular Regulatory Cells Prolongs Germinal Center Reactivity in Transplantation**
E. S. Crichton, S. Zeng, I. Badell, *Emory University, Atlanta, GA*

558 **Tip60 Inhibitors Enhance Regulatory T Cells (Treg) Induction by Promoting Acetylation of Foxp3**
F. Fueyo-Gonzalez[1], G. Vilanova[2], M. Fribourg[1], *[1]Department of Medicine, Translational Transplant Research Center, Icahn School of Medicine at Mount Sinai, New York, NY, [2]LaCàN, Universitat Politècnica de Catalunya-BarcelonaTech, Barcelona, Spain*

559 **IL-10 Signaling in T Cells Modulates Costimulation-independent Activation and is Essential for Transplant Tolerance Induction**
M. Iglesias Lozano[1], D. Bibicheff[1], M. Chicco[2], A. Komin[1], G. Brandacher[1], G. Raimondi[1], *[1]Plastic Surgery, Johns Hopkins University, Baltimore, MD, [2]Frimley Health NHS Foundation Trust, London, United Kingdom*

560 **Evaluation of the Differentiation Program of Endogenous Antigen-specific CD8⁺T Cells Following Transplantation**
S. M. Krummey[1], K. Tong[2], M. L. Ford[2], *[1]Pathology, Johns Hopkins University, Baltimore, MD, [2]Surgery, Emory Transplant Center, Atlanta, GA*

561 **CD40/40L Pathway is Critical in Controlling CMV Transmission Following Kidney Transplantation in Immunocompromised Mice**
X. Lai[1], L. Qiu[2], J. Wang[1], L. VanOsdol[1], S. Yan[3], M. Kandpal[4], M. Abecassis[5], Z. Zhang[1], *[1]Comprehensive Transplant Center, Microsurgery core, Northwestern University, Chicago, IL, [2]University of California,, San Francisco, CA, [3]Northwestern University, Chicago, IL, [4]Comprehensive Transplant Center, Northwestern University, Chicago, IL, [5]University of Arizona, Tucson, AZ*

562 **Laminins Differentially Regulate Tolerogenic T Cell Migration and Homing to Lymph Nodes**
L. Li[1], M. Shirkey[1], W. Piao[1], Y. Xiong[1], V. Saxena[2], T. Zhang[1], J. Iyyathurai[2], R. Lakhan[1], R. Abdi[3], J. Bromberg[1], *[1]Surgery, UMB, Baltimore, MD, [2]CVID, UMB, Baltimore, MD, [3]Harvard University, Boston, MA*

563 **P2X7 Receptor Activity Mediates Th17-Specific Self- and Alloreactivity in Non-Human Primates**
C. Little, J. Sullivan, W. Burlingham, D. Kaufman, *Department of Surgery, University of Wisconsin, Madison, WI*

564 **Single Cell RNAq-seq Analysis of Paired Peripheral and Intragraft T Cells Reveals Biopsy Specific Fc Receptor Gene Expression in Rejection Only**
A. Malone, A. Leckie-Harre, I. Silverman, A. Chadha, H. Wu, B. Humphreys, *Washington University School of Medicine, St Louis, MO*

565 **Establishing a Linear Program for the Development of Costimulation Resistant T-Cells**
D. P. Moris, A. Lucander, A. Kirk, *Surgery, Duke, Durham, NC*

566 **K562 Cells Expressing HLA-A2 Stimulate Alloreactive CD8+ T Cells**
A. B. Morris, E. Peek, A. Hadley, C. P. Larsen, *Emory Transplant Center, Emory University, Atlanta, GA*

567 **CD80/PD-L1 Uniquely Regulates CD4 Effector T Cell Migration**
W. Piao[1], L. Li[1], Y. Zhang[2], K. Hippen[2], M. WillsonShirkey[1], B. Blazar[2], L. Riella[3], J. Bromberg[1], *[1]U Maryland, baltimore, MD, [2]U Minnesota, Minneapolis, MN, [3]Harvard U, boston, MA*

568 **CRISPR Screens to Map CTLA-4 Regulatory Networks in Primary Human T Cells**
O. Shaked[1], J. Freimer[1], J. Pritchard[2], A. Marson[1], *[1]UCSF, San Francisco, CA, [2]Stanford University, Stanford, CA*

569 **Anti-CD272 Antibody (6B2) Generated Foxp3⁺Regulatory T Cells and Suppressed Donor Specific Antibody in Murine Cardiac Transplant Model**
Y. Yamamoto[1], M. Uchiyama[2], K. Uchida[3], H. Yagita[3], M. Niimi[1], *[1]Department of Surgery, Teikyo University, Tokyo, Japan, [2]Department of Cardiovascular Surgery, Teikyo University, Tokyo, Japan, [3]Juntendo University, Tokyo, Japan*

570 **Alloreactive Memory T Follicular Helper Cells Rapidly Differentiate Into Effectors Independent of B Cell Memory Following Retransplantation**
S. Zeng, E. S. Crichton, I. R. Badell, *Department of Surgery, Emory, Atlanta, GA*

571 **Distinct Phenotype and Function of Antibody-suppressor Cxcr5^{+}Cd8^{+} T Cells**
J. Zimmerer, J. Han, M. Hart, S. Chaudhari, C. Peterson, G. Bumgardner, *OSU, Columbus, OH*

LB 37 **Proteomic Analysis of Extracellular Vesicles Derived From a Potent Donor-specific Regulatory T Cell-enriched Population Demonstrates Multiple Markers of Immune Suppression**
B. Schreiber[1], S. Tripathi[1], M. Blaser[2], T. Pham[2], S. Kuraoka[2], S. A. Singh[2], E. Aikawa[2], A. Chandraker[1], *[1]Transplantation Research Center, Renal Division, Brigham and Women's Hospital, Boston, MA, [2]Center for Interdisciplinary Cardiovascular Sciences, Division of Cardiovascular Medicine, Brigham and Women's Hospital, Boston, MA*

Tolerance / Immune Deviation

572 **Estrogen Receptors Alpha and Beta are Required for Immune Homeostasis and Normal Treg Function**
L. M. Christensen[1], T. Akimova[2], G. Ge[3], R. Han[1], L. Wang[1], P. Hernandez[3], C. O'Brien[3], M. H. Levine[3], W. W. Hancock[1], *[1]Children's Hospital of Philadelphia, Philadelphia, PA, [2]Children's Hospital of Philadelphia and University of Pennsylvania, Philadelphia, PA, [3]University of Pennsylvania, Philadelphia, PA*

574 **Selective Bcl-2 Inhibition to Deplete Hematopoietic Stem Cells in Bone Marrow Niche: A Novel Approach to Promote Mixed Chimerism**
T. Hirose[1], H. Sasaki[1], G. Lassiter[1], D. Ma[1], T. Oura[1], A. Dehnadi[1], A. Cosimi[1], P. Cippa[2], T. Fehr[2], T. Kawai[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA, [2]Institute of Physiology, University of Zurich, Zurich, Switzerland*

575 **Donor Lymphocytes in Peripheral Blood of Patients After Lung Transplantation Comprise High Frequencies of Killer Cell Immunoglobulin-like Receptor-positive T and NK Cell Subsets**
J. F. Kühne[1], A. Hitz[1], K. A. Bläsing[1], B. Wiegmann[2], R. Bellmàs Sanz[1], F. Ius[2], A. Haverich[2], G. Warnecke[2], C. S. Falk[1], *[1]MHH, Institute of Transplant Immunology, Hannover, Germany, [2]MHH, Department for Cardiothoracic, Transplantation and Vascular Surgery, Hannover, Germany*

576 **Selective Bcl-2 Inhibition for Induction of Mixed Chimerism and Renal Allograft Tolerance without Myelosupression**
G. Lassiter[1], T. Hirose[1], H. Sasaki[1], D. Ma[1], T. Oura[1], A. Dehnadi[1], A. Cosimi[1], P. Cippa[2], T. Fehr[3], T. Kawai[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA, [2]Division of Nephrology, Ente Ospedaliero Cantonale, Lugano, Switzerland, [3]Division of Nephrology, University of Zurich, Zurich, Switzerland*

577 **Effects of IL-2 and/ or Anti-IL6R Therapy on Long-term Cardiac Allograft Survival in Non-Human Primates (NHPs)**
C. L. Miller, K. J. Ahrens, J. M. O, P. M. Patel, J. A. Morrissette, D. Becerra, T. Costa, A. Dehnadi, I. M. Hanekamp, G. Benichou, J. C. Madsen, *Center for Transplantation Sciences, Massachusetts General Hospital, Boston, MA*

578 **Donor T and NK Cells with a Special Tissue-Resident Memory Phenotype Migrate Into the Periphery of Lung Transplant Recipients - A Potential Feature for Tolerance Development**
L. M. Ruhl[1], R. Bellmàs Sanz[1], A. Hitz[1], B. Wiegmann[2], K. A. Bläsing[1], W. Sommer[2], F. Ius[2], J. F. Kühne[1], A. Knöfel[2], L. M. Horn[1], I. Tudorache[2], A. Haverich[2], D. Jonigk[3], G. Warnecke[2], C. S. Falk[1], *[1]MHH, Institute of Transplant Immunology, Hannover, Germany, [2]MHH, Department for Cardiothoracic, Transplantation and Vascular Surgery, Hannover, Germany, [3]MHH, Institute of Pathology, Hannover, Germany*

LB 39 **Regulatory Macrophage Induced by Il-33 Promoted Immune Tolerance of Kidney Transplantation Through Siglec-10**
J. d. zhang, w. wang, *Urology, Beijing Chaoyang Hospital, Capital Medical University, Beijing, China*

Tolerance: Clinical Studies

682 **Results of Litmus (nct 02541916): The Liver Immune Tolerance Bio Marker Utilization Study**
A. Chruscinski[1], V. Rojas-Luengas[1], A. Issacher[1], L. Lilly[1], E. Renner[1], M. Epstein[1], O. Adeyi[1], S. Fischer[1], Z. Galvin[1], S. Moshkelgosha[1], E. Jaeckel[2], S. Juvet[1], N. Selzner[1], G. Levy[1], *[1]Multi-Organ Transplantation, University Health Network, Toronto, ON, Canada, [2]Hannover Medical School, Hannover, Germany*

683 **Expansion of Cd45ra-foxp3hi Activated Regulatory T Cells Predict Immune Tolerance in Patients with Combined Kidney and Bone Marrow Transplantation**
Y. Kwon[1], K. Lee[2], J. Park[2], *[1]Transplantation Research Center, Samsung Medical Center, Seoul, Korea, Republic of, [2]Department of Surgery, Samsung Medical Center, Seoul, Korea, Republic of*

684 **Inducing Transient Mixed Chimerism without Chimeric Transition Syndrome for Tolerance Induction After Kidney Transplantation**
K. Lee, J. Park, *Samsung Medical Center, Seoul, Korea, Republic of*

685 **Long-Term Follow-Up of a Phase 2 Clinical Trial to Induce Tolerance in Living Donor Renal Transplant Recipients**
J. Leventhal[1], J. Galvin[2], J. Mathew[1], L. Gallon[1], D. Belshe[1], M. Gibson[1], K. Ravindra[3], M. Horwitz[3], S. Ildstad[4], *[1]Northwestern University, Comprehensive Transplant Center, Chicago, IL, [2]Northwestern University, Chicago, IL, [3]Duke Medical Center, Durham, NC, [4]University of Louisville, Llouisville, KY*

Xenotransplantation

588 **Cold Perfusion for Ischemia Minimization Reduces Cardiac Injury in an Ex Vivo Xenoperfusion Model**
M. R. Connolly[1], A. Calhoun[1], F. Pollok[1], L. Burdorf[1], Z. Habibabady[1], M. Ma[1], S. Miura[1], W. Eyestone[2], C. Phelps[2], D. Ayares[2], *[1]Massachusetts General Hospital, Boston, MA, [2]Revivicor, Blacksburg, VA*

589 **Imaging Flow Cytometry Reveals That Platelet-Sized Erythrocyte Fragments are Formed During Pig Organ Perfusion with Human Blood**
Z. A. Habibabady[1], F. Ellett[2], L. Burdorf[1], M. Connolly[1], F. Pollok[1], D. Irimia[2], R. N. Pierson III[1], A. M. Azimzadeh[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital and Harvard School of Medicine, Boston, MA, [2]Center for Engineering in Medicine and Surgery, Massachusetts General Hospital and Harvard School of Medicine, Boston, MA*

590 **Initial Experience with Growth Hormone Receptor Knockout in Pig-to-Baboon Kidney Transplantation: Effect on Ureteric Viability and Kidney Growth**
C. Hansen-Estruch[1], H. Iwase[1], A. Jagdale[1], T. Yamamoto[1], M. H. Bikhet[1], J. Foote[2], H. Hara[1], D. Anderson[1], P. Porrett[1], D. Eckhoff[1], D. Ayares[3], W. Eyestone[3], J. Locke[1], D. K. Cooper[1], *[1]Xenotransplantation Program, Department of Surgery, University of Alabama at Birmingham, Birmingham, AL, [2]Department of Microbiology and Animal Resources Program, University of Alabama at Birmingham, Birmingham, AL, [3]Revivicor, Blacksburg, VA*

591 **Anti-pig IgE and IgA Antibodies in Sera of (i) Naïve Primates and (ii) Non-human Primates Sensitized to Pig Xenografts**
H. Hara, Q. Li, H. Iwase, T. Yamamoto, D. Ayares, D. K. Cooper, *University of Alabama at Birmingham, Birmingham, AL*

592 **Transgenic Overexpression of Human Ectonucleoside Triphosphate Diphosphohydrolase 1 (entpd1, Or Hcd39) in Pig to Primate Xenotransplantation Models**
R. Matheson[1], K. Deng[1], K. M. Lee[1], Z. A. Habibabady[1], C. G. Rickert[1], K. J. Ahrens[1], J. M. O[1], D. Becerra[1], P. Patel[1], W. Westlin[2], M. Youd[2], N. Serifis[1], T. M. Coe[1], D. Cloonan[1], A. M. Azimzadeh[1], C. LeGuern[1], J. C. Madsen[1], S. C. Robson[3], J. F. Markmann[1], *[1]Transplantation Surgery Research, Massachusetts General Hospital, Boston, MA, [2]eGenesis, Cambridge, MA, [3]Beth Israel Deaconess Medical Center, Boston, MA*

593 **HTFPI.hCD47 and Adhesion Inhibition in GTKO.hCD46 Pig Lung Xenograft Injury**
S. Miura[1], L. Burdorf[1], Z. Habibabady[1], A. Dandro[2], M. Connolly[1], S. Pratts[1], C. Phelps[2], W. Eyestone[2], D. Ayares[2], A. Azimzadeh[1], R. Pierson III[1], *[1]Center for Transplantation Sciences, Massachusetts General Hospital, Charlestown, MA, [2]Revivicor, Inc, Blacksburg, VA*

594 **Triple-Knockout Pig Red Blood Cells Are a Potential Alternative Source for Clinical Blood Transfusion**
T. Yamamoto[1], M. H. Bikhet[1], H. Q. Nguyen[1], M. Javed[1], D. Ayares[2], H. Iwase[1], H. Hara[1], D. K. Cooper[1], *[1]Xenotransplantation Program, Surgery, The University of Alabama at Birmingham, Birmingham, AL, [2]Revivicor, Blacksburg, VA*

COVID-19

COVID-19

LB 43 **SARS-CoV-2 Infection in Solid Organ Transplant Recipients: A Retrospective Cohort Study**
A. Adeel, *Infectious Diseases, University of Massachusetts, Worcester, MA*

LB 44 **Kidney Transplantation in Patients with Prior Coronavirus Disease 2019 (COVID-19)**
A. Santeusanio, A. Bhansali, M. Rana, S. Lerner, D. Von Ahrens, O. Sulimani, S. Farouk, F. Tedla, R. Shapiro, *Mount Sinai Hospital, New York, NY*

754 **Evaluation of High-versus Low-Dose Valganciclovir for Cytomegalovirus Prevention in Adult Liver Transplant Recipients: A Single Center Experience**
P. Parikh[1], M. Siddiqui[2], O. De La Cruz[2], G. Gupta[2], D. Kumar[2], I. Yakubu[2], *[1]Our Lady of the Lake Regional Medical Center, Baton Rouge, LA, [2]Virginia Commonwealth University Health System, Richmond, VA*

755 **Beta-lactam Allergies Among Solid Organ Transplant Recipients: Prevalence and Association with Transplant Admission Length of Stay**
N. N. Pettit[1], V. Nguyen[2], C. T. Nguyen[1], A. Lew[1], J. Pisano[1], L. M. Potter[1], *[1]University of Chicago Medicine, Chicago, IL, [2]University of Michigan College of Pharmacy, Ann Arbor, MI*

756 **Covid vs Non Covid Pneumonia in Kidney Transplant Recipients**
R. Prashar, N. Khoury, P. Shrivastava, S. Yeddula, T. Kitajima, E. Ulrich, M. Ramesh, A. Patel, S. Nagai, M. Samaniego-Picota, *Henry Ford Hospital, Detroit, MI*

757 **PDSA Model to Improve Pneumococcal Vaccine Adherence Among Kidney Transplant Candidates**
J. M. Ramakrishna, L. Brumble, C. R. Libertin, *Division of Infectious Diseases, Mayo Clinic, Florida, Jacksonville, FL*

758 **Covid-19 in Hiv-infected Solid Organ Transplant Recipients: A Case Series**
M. Ramanathan, A. Fernandez, Y. Natori, J. Simkins, J. Camargo, M. Morris, N. Rivera, M. Loebe, G. Ciancio, L. Abbo, A. Mattiazzi, G. Guerra, S. Anjan, *University of Miami, Miami, FL*

759 **Clinical Outcomes of Culture-Positive Pneumonia in Solid Organ Transplant Recipients**
L. Rice[1], A. C. Kalil[2], D. Hixson[2], M. Leick[3], *[1]Monument Health, Rapid City, SD, [2]University of Nebraska Medical Center, Omaha, NE, [3]Nebraska Medicine, Omaha, NE*

760 **Donor-Derived Tuberculosis in Lung Transplant Recipients, a Single Center Experience**
M. Robbins, D. Kabbani, C. Cervera, C. O'Neil, R. Cooper, K. Halloran, S. Grocholski, K. Doucette, *University of Alberta, Edmonton, AB, Canada*

761 **Pregnancy After CMV Infection Following Uterus Transplantation: A Case Report**
M. Rosenzweig, A. Wall, G. Testa, L. Johannesson, *Abdominal Transplant Surgery, Baylor University Medical Center, Dallas, TX*

762 **Covid-19 Reinfection in a Kidney Transplant Patient**
Z. Saeed Zafar, D. Malhotra, *Nephrology, Yale School of Medicine, New Haven, CT*

763 **Kidney Transplant Outcomes in HIV+ Recipients: A Single-Center Study**
M. Samra[1], A. Hall[2], I. Tang[2], *[1]Medicine, Edward Hines VA, Hines, IL, [2]Medicine, University of Illinois, Chicago, IL*

764 **Covid-19 Caseload and Management Practices Vary by Program-Level Factors: A Multinational Survey Study**
S. Sandal[1], B. Boyarsky[2], P. Chiang[2], A. Massie[2], D. Segev[2], M. Cantarovich[1], *[1]McGill University, Montreal, QC, Canada, [2]Johns Hopkins University, Baltimore, MD*

765 **Perioperative Anidulafungin Combined with Triazole Prophylaxis for the Prevention of Early Invasive Candidiasis in Lung Transplant Recipients**
E. Sartain[1], K. Schoeppler[1], B. Crowther[1], J. B. Smith[2], M. Abidi[3], T. J. Grazia[4], M. Steele[2], T. Gleason[2], K. Porter[2], A. Gray[2], *[1]University of Colorado Skaggs School of Pharmacy, Aurora, CO, [2]Division of Pulmonary Sciences and Critical Care, University of Colorado, Denver, CO, [3]Division of Infectious Disease, University of Colorado, Denver, CO, [4]Baylor University Medical Center, Dallas, TX*

766 **COVID-19 Infection in Kidney versus Non-kidney Solid Organ Transplant Recipients: A Single Center Study**
J. Schaenman[1], H. Byford[2], T. R. Grogan[3], S. Fraschilla[2], K. Meneses[4], J. C. Alejos[5], M. Rivera[6], S. Saab[7], *[1]Infectious Diseases, UCLA, Los Angeles, CA, [2]Transplant Administration, UCLA, Los Angeles, CA, [3]Division of General Internal Medicine and Health Services Research, UCLA, Los Angeles, CA, [4]Liver Transplantation, UCLA, Los Angeles, CA, [5]Pediatric Heart Transplantation, UCLA, Los Angeles, CA, [6]Pediatric Kidney Transplantation, UCLA, Los Angeles, CA, [7]Liver Transplantation, David Geffen School of Medicine at UCLA, Los Angeles, CA*

767 **Impact of Sars-cov-2 Infection in Waiting List for Liver Transplantation: A Cohort Study on Clinical Outcomes**
A. Sessa, A. Mazzola, B. Granger, D. Wakselman, M. Atif, V. Martinez, M. Mallet Maxime, D. Thabut, O. Scatton, F. Conti, *Hopital Pitie Salpetriere, Paris, France*

768 **Delayed Valganciclovir Initiation and the Incidence of Cytomegalovirus Infection in Liver Transplant Recipients**
S. Shaikh, P. Kawewat-Ho, Y. Genyk, L. Sher, J. Kahn, L. Rivera, *Keck Medical Center of USC, Los Angeles, CA*

769 **Quantiferon-tb Gold Plus in Liver Transplant Candidates: Single-center Experience**
J. Simkins[1], M. A. Mendoza[1], A. Chandorkar[1], Y. Natori[1], S. Anjan[1], L. R. Arosemena[1], R. Vianna[2], *[1]Medicine, University of Miami, Miami, FL, [2]Surgery, University of Miami, Miami, FL*

770 **Nosocomial COVID-19 Among Hospitalized Solid Organ Transplant Recipients**
J. T. Swan[1], A. Tran[1], E. Rizk[2], E. A. Graviss[1], A. Drews[2], K. A. Grimes[2], D. T. Nguyen[1], S. G. Yi[2], R. R. McMillan[2], F. Yuan[1], I. Carrillo[3], G. Book[3], F. R. Zabaneh[3], L. W. Moore[1], A. O. Gaber[2], *[1]Houston Methodist Research Institute, Houston, TX, [2]Houston Methodist Hospital, Houston, TX, [3]Houston Methodist, Houston, TX*

771 **Cytomegalovirus Nephritis: Epidemiology and Outcomes of an Uncommon Diagnosis**
K. J. Swanson, A. Djamali, A. Ghaffar, F. Aziz, N. Garg, M. Mohamed, D. A. Mandelbrot, M. Jorgensen, S. Parajuli, *Division of Nephrology, University of Wisconsin-Madison, Madison, WI*

772 **Changes in Cytomegalovirus Specific T Cell Immunity With Immunomodulation in Serodiscordant High Risk Transplant Recipients**
T. Tinkham, C. Song, R. Winstead, I. Yakubu, A. Brown, S. Sterling, G. Gupta, D. Kumar, *Virginia Commonwealth University Health, Richmond, VA*

773 **Ganciclovir Therapeutic Drug Monitoring in Obese Adults Patients - Opportunity for Clinical Utility**
Y. Tran[1], S. Bernard[1], R. W. Stevens[1], L. Myhre[1], R. Razonable[2], *[1]Department of Pharmacy, Mayo Clinic, Rochester, MN, [2]Division of Infectious Diseases, Department of Internal Medicine, Mayo Clinic, Rochester, MN*

Kidney Infectious Non-Polyoma & Non-Viral Hepatitis

774 **Variation of Mortality from SARS-CoV-2 Infection in Kidney Transplant Recipients Over the Course of the Pandemic**
Y. Al Azzi, C. Pynadath, P. Loarte, O. Alani, L. Liriano-Ward, M. Ajaimy, R. Bartash, J. Graham, M. Le, H. Yaffe, S. Greenstein, J. Rocca, M. Kinkhabwala, E. Akalin, *Montefiore Medical Center, New York, NY*

775 **Risk Factors of COVID-19 in Kidney Transplant Recipients**
M. M. Alkadi, E. Abuhelaiqa, M. Asim, O. Fituri, R. Elidrisi, R. Abdul Rahiman, M. Elshirbeny, M. Othman, A. Hamad, A. Ashour, A. Hamdi, A. Nauman, H. Tohid, M. Jarman, H. Al-Malki, *Nephrology-Medicine, Hamad Medical Corporation, Doha, Qatar*

776 **Impact of Early versus Late Ureteric Stent Removal and Antibiotic Prophylaxis on Urinary Tract Infection Incidence in Kidney Transplant Adult Recipients**
K. Althiab[1], B. Alqahtani[2], R. Alotaibi[3], R. Alhussein[3], R. Almuhiteb[2], L. Alnajjar[2], M. Alqahtani[2], K. Bin Saad[4], W. Ohali[4], A. Tamimi[4], M. N. Almarastani[4], S. Kashkoush[4], G. Aboalsameh[4], M. Shaheen[4], M. Tawhari[4], A. Altheaby[4], Z. Arabi[5], *[1]Pharmaceutical Care Services, King Abdulaziz Medical Center, Riyadh, Saudi Arabia, [2]College of Pharmacy, Princess Nourah bint Abdulrahman University, Riyadh, Saudi Arabia, [3]bCollege of Pharmacy, Princess Nourah bint Abdulrahman University, Riyadh, Saudi Arabia, [4]Organ Transplant Center, King Abdulaziz Medical Center, Riyadh, Saudi Arabia, [5]King Abdulaziz Medical Center, Riyadh, Saudi Arabia*

777 **Methenamine for the Prevention of Recurrent UTIs Post-Renal Transplant**

A. Bigness[1], S. Mohamed[2], S. Mandala[1], N. Khodieva[2], K. Robichaux[3], H. Mohammed[1], J. Buggs[4], A. Kumar[1], A. Brueckner[5], L. Bowman[5], *[1]Morsani College of Medicine, University of South Florida, Tampa, FL, [2]College of Public Health, University of South Florida, Tampa, FL, [3]Honors College, University of South Florida, Tampa, FL, [4]Transplant Surgery, Tampa General Hospital, Tampa, FL, [5]Department of Pharmacology, Tampa General Hospital, Tampa, FL*

778 **Outcomes Among CMV Mismatched and Highly Sensitized Kidney Transplant Recipients Who Develop Leukopenia or Neutropenia**

S. Brar[1], R. Berry[2], A. Raval[3], Y. Tang[3], F. Vincenti[2], N. Skartsis[2], *[1]University of British Columbia, Vancouver, BC, Canada, [2]University of California, San Francisco, San Francisco, CA, [3]Merck and Co., Inc., Kenilworth, NJ*

779 **Clinical Characteristics, Risk Factors and Outcomes of Norovirus Infection in Renal Transplant Patients: A Retrospective Single Center Study**

T. Brooks[1], T. Crilley[1], B. Gaglani[2], N. Jakharia[2], *[1]Department of Internal Medicine, Wake Forest University Baptist Medical Center, Winston Salem, NC, [2]Division of Infectious Diseases, Wake Forest University Baptist Medical Center, Winston Salem, NC*

780 **Evaluation of Low Dose Famciclovir as Herpes Simplex Virus and Varicella Zoster Virus Prophylaxis in Cytomegalovirus Low Risk Solid Organ Transplant Recipients**

M. Cote, A. Cubley, C. Rogers, S. Shao, C. N. Kotton, *Massachusetts General Hospital, Boston, MA*

781 **Relationship Between Diabetes Mellitus and Covid-19 Prognosis in Kidney Transplant Patients**

D. D. de Lucena, I. A. de Brito, M. P. Cristelli, J. O. Medina-Pestana, H. Tedesco-Silva, É. B. Rangel, *Department of Medicine, Division of Nephrology, Federal University of São Paulo, São Paulo, Brazil*

782 **Management of Asymptomatic Bacteriuria in Kidney Transplant Recipients**

A. Diamond, *Pharmacy, Temple University Hospital, Philadelphia, PA*

783 **Survival Outcomes in Kidney Transplant Recipients Aged 18-60 Years by CMV Discordance Status: A Multivariable Analysis**

A. Dinesh[1], T. Shaker[1], S. Jackson[2], S. Riad[3], T. L. Pruett[1], *[1]Division of Transplantation, Department of Surgery, University of Minnesota, Minneapolis, MN, [2]Biostatistics, Analytics Consulting Services- Solid Organ Transplant, M Health Fairview, Minneapolis, MN, [3]Department of Medicine, University of Minnesota, Minneapolis, MN*

784 **Does High-Risk CMV Discordance Affect Elderly Kidney Transplant Recipient Survival? A Multivariable Analysis**

A. Dinesh[1], S. Jackson[2], S. Riad[3], T. L. Pruett[1], *[1]Division of Transplantation, Department of Surgery, University of Minnesota, Minneapolis, MN, [2]Biostatistics, Analytics Consulting Services- Solid Organ Transplant, M Health Fairview, Minneapolis, MN, [3]Department of Medicine, University of Minnesota, Minneapolis, MN*

785 **Outcomes of Kidney Transplantation at the Epicenter of the Covid-19 Pandemic: The Experience of the Ospedale Maggiore Policlinico**

E. Favi[1], C. Alfieri[2], M. Gandolfo[2], A. Brescacin[1], M. Bilato[3], R. Cacciola[4], P. Messa[2], M. Ferraresso[5], *[1]Renal Transplantation, Ospedale Maggiore Policlinico, Milan, Italy, [2]Nephrology, Ospedale Maggiore Policlinico, Milan, Italy, [3]Urology, Ospedale Maggiore Policlinico, Milan, Italy, [4]HBP Surgery, Policlinico Tor Vergata, Rome, Italy, [5]Department of Clinical Sciences and Community Health, University of Milan, Milan, Italy*

786 **Delay in Pediatric Kidney Transplantation Due to Infection: A Single Center Study**

T. A. Heald-Sargent[1], S. Manz[2], P. Verghese[3], *[1]Pediatric Infectious Diseases, Lurie Children's Hospital/Northwestern University, Chicago, IL, [2]Central Michigan University, Mt Pleasant, MI, [3]Pediatric Kidney Diseases, Lurie Children's Hospital/Northwestern University, Chicago, IL*

787 **Clinical Outcomes and Management of Covid-19 Patients Among Kidney Transplant Recipients: A Systematic Review**

S. Ismail[1], A. Babonj[2], S. Al Harbi[3], A. Babonj[2], A. Almalki[1], E. J. Murray[4], *[1]King Khalid hospital, MNGHA, Jeddah, Saudi Arabia, [2]King Abdulaziz University, Jeddah, Saudi Arabia, [3]King Faisal Specialist Hospital, Jeddah, Saudi Arabia, [4]Boston University School of Public Health, Boston, MA*

788 **Efficacy and Safety of a High Dose Ganciclovir Dosing Strategy in Kidney and Pancreas Transplant Recipients**

M. Jorgenson[1], J. Descourouez[1], G. Leverson[2], C. Saddler[2], J. Smith[2], D. Mandelbrot[2], J. Odorico[2], *[1]UW Health, Madison, WI, [2]UW School of Medicine and Public Health, Madison, WI*

789 **Covid 19 Re-infection versus Reactivation in Two Renal Transplant Patients**

L. Liriano-Ward, Y. Al Azzi, R. Bartash, C. Pynadath, M. Ajaimy, P. Loarte, J. Graham, S. Greenstein, M. Kinkhabwala, J. Rocca, E. Akalin, *Montefiore Medical Center, New York, NY*

790 **Infectious Complications and Malignancy After Kidney Transplantation in the Elderly Population**

L. Liriano-Ward, M. Parides, Y. Al Azzi, C. Pynadath, M. Ajaimy, P. Loarte, J. Graham, S. Greenstein, M. Le, H. Yaffe, M. Kinkhabwala, J. Rocca, E. Akalin, *Montefiore Medical Center, New York, NY*

791 **Impact of Belatacept and Tacrolimus on Cmv Viral Load Control and Relapse in Moderate and High-risk Cmv Serostatus Kidney Transplant Recipients**

W. Magua[1], A. C. Johnson[1], G. M. Karadkhele[1], I. R. Badell[1], P. Vasanth[1], M. G. Lyon III[2], A. K. Mehta[2], K. A. Easley[3], J. Rickert[4], C. P. Larsen[1], *[1]Department of Surgery, Emory University, Atlanta, GA, [2]Department of Medicine, Emory University, Atlanta, GA, [3]Biostatistics and Bioinformatics, Emory University, Atlanta, GA, [4]RStudio and R Consortium, San Jose, CA*

792 **Impact of Non-active Hepatitis B on Patient Survival After Renal Transplantation**

A. Paschereit[1], K. Budde[2], M. Duerr[2], M. G. Naik[2], *[1]Medical Department, Division of Nephrology and Internal Intensive Care Medicine, Charité University Medicine Berlin, Berlin, Germany, [2]Medical Department, Division of Nephrology and Internal Intensive Care Medicine, Charité, Berlin, Germany*

793 **Intensive Monitoring and Early Treatment for Urinary Infection in Renal Transplant Recipients Reduces Readmission and Sepsis**

A. Patel, S. Desai, B. R. Schleich, M. Wynd, T. Carrea, Y. Yushkov, S. Geatrakas, N. White, R. Luongo, R. Sosnicki, V. Wadhera, D. Serur, M. J. Goldstein, *Organ Transplant, Hackensack University Medical Center, Hackensack, NJ*

794 **Unquantified Blips Lead to CMV Slips - Post Transplant CMV Monitoring in High Risk Kidney Transplant Recipients**

A. T. Payne[1], J. G. Timpone[2], A. Gilbert[2], B. Thomas[2], B. K. Lindner[2], *[1]Georgetown University School of Medicine, Washington, DC, [2]Medstar Georgetown University Hospital, Washington, DC*

795 **Discontinuation of Trimethoprim/sulfamethoxazole Prophylaxis Due to Hyperkalemia in Kidney Transplant Recipients**
D. Pett[1], G. Malat[2], C. Domenico[1], R. Samudralwar[1], A. Forte[1], D. Sawinski[2], J. Hu[1], B. Steiner[1], J. Rashid[1], J. Trofe-Clark[2], *[1]Pharmacy, Hospital of Univ of Pennsylvania, Philadelphia, PA, [2]Penn Transplant Institute, Hospital of Univ of Pennsylvania, Philadelphia, PA*

796 **Covid Infection Among Kidney Transplant Recipients: Management and Outcomes**
A. Price, K. Soliman, C. Zayas, V. Rao, M. Casey, D. Taber, M. Posadas Salas, *Medical University of South Carolina, Charleston, SC*

797 **SARS-CoV-2 Infection Among Kidney Transplant Recipients: A Multicenter Brazilian Cohort Study**
T. Sandes-Freitas[1], J. Medina-Pestana[2], o. COVID-19 Brazil Study Group[3], *[1]Universidade Federal do Ceará, Fortaleza, Brazil, [2]Hospital do Rim, São Paulo, Brazil, [3]Brazil, Brazil, Brazil*

798 **Risk Factors Associated with Multidrug Resistant Organism (MDRO) Infections in Kidney Transplant Recipients: A Single Center Experience**

Loukopoulos[1], *[1]Department of Transplantation, Guy's Hospital, Guy's and St Thomas' NHS Foundation Trust, London, United Kingdom, [2]School of Population Health and Environmental Studies, King's College London, London, United Kingdom*

848 **The Implications of Donor-Recipient Size Mismatch in Renal Transplantation**

I. D. Kostakis, N. Karydis, T. Kassimatis, N. Kessaris, I. Loukopoulos, *Department of Transplantation, Guy's Hospital, Guy's and St Thomas' NHS Foundation Trust, London, United Kingdom*

849 **Trends in the Recovery and Discard of Kidneys from Deceased Donors with Acute Kidney Injury from 2010-2018**

C. Liu[1], S. Alasfar[2], P. P. Reese[3], S. Mohan[4], M. D. Doshi[5], I. E. Hall[6], H. R. Thiessen-Philbrook[2], Y. Jia[2], D. E. Stewart[7], C. Parikh[2], *[1]Icahn School of Medicine at Mount Sinai, New York, NY, [2]Johns Hopkins University School of Medicine, Baltimore, MD, [3]Perelman School of Medicine, Philadelphia, PA, [4]New York-Presbyterian/Columbia University Irving Medical Center, New York, NY, [5]University of Michigan, Ann Arbor, MI, [6]University of Utah School of Medicine, Salt Lake City, UT, [7]United Network for Organ Sharing, Richmond, VA*

850 **Two-for-One Kidney Transplant Outcomes**

C. Malanga[1], H. Madeem[2], K. Robichaux[2], J. Buggs[3], A. Kumar[1], V. Bowers[3], *[1]Morsani College of Medicine, University of South Florida, Tampa, FL, [2]Honors College, University of South Florida, Tampa, FL, [3]Transplant Surgery, Tampa General Hospital, Tampa, FL*

851 **Transplant Center Volume in High-risk Donors are Associated with Graft and Patient Survival**

M. A. Merzkani, H. Murad, M. Mattu, M. Wang, V. Hu, S. Chang, T. Alhamad, *Transplant, Washington University, Saint Louis, MO*

852 **Improving Eligibility of Renal Transplants in the Elderly**

L. B. Moraitis, J. Rogers, A. Farney, A. Reeves-Daniel, G. Orlando, W. Doares, S. Kaczmorski, A. Mena-Gutierrez, C. Jay, R. Stratta, *Abdominal Organ Transplant, Wake Forest Baptist Health, Winston-Salem, NC*

853 **Outcomes in Older Recipients Receiving Kidneys from Donors with Acute Kidney Injury (AKI)**

S. Nair, K. Reddy, L. Kodali, P. Budhiraja, J. Ninan, C. Jadlowiec, A. Mathur, J. Harbell, H. Khamash, M. Smith, R. Heilman, *Mayo Clinic, Phoenix, AZ*

855 **Efficacy of Hope: Analysis of Quality HIV+ Deceased Donor Organ Availability**

G. E. Owens[1], B. Shelton[1], P. MacLennan[1], D. Sawinski[2], J. E. Locke[1], *[1]Transplant, University of Alabama at Birmingham, Birmingham, AL, [2]Transplant, University of Pennsylvania, Philadeplphia, PA*

857 **Excellent Outcomes of Kidney Transplantation from Hepatitis C Infected Donors**

B. Rawashdeh, J. Dann, K. M. Marsh, A. Doddi, S. Rao, A. Agarwal, *UVA Health System, University of Virginia, Charlottesville, VA*

858 **Donation After Circulatory Death Kidney Transplantation Has Equal Long-Term Graft and Patient Survival as Donation After Brain Death: A Systematic Review and Meta-Analysis**

E. Rijkse[1], S. Ceuppens[1], H. Qi[2], J. N. IJzermans[1], D. A. Hesselink[3], R. C. Minnee[1], *[1]HPB/Transplant surgery, Erasmus Medical Center, Rotterdam, Netherlands, [2]Biostatistics, Erasmus Medical Center, Rotterdam, Netherlands, [3]Nephrology and Transplantation, Erasmus Medical Center, Rotterdam, Netherlands*

859 **Prolonged Cold Ischemic Time Demonstrating Minor Effect on Outcomes Following Renal Transplantation - A Paired Kidney Analysis**

N. Sanichar[1], V. Sandra[2], K. L. King[2], S. A. Husain[2], S. Mohan[2], *[1]Columbia University Irving Medical Center, New York, NY, [2]Columbia University, New York, NY*

860 **A Kidney Waitlist Outcomes Timeline to Visualize Candidate Offers and Outcomes**

C. Schaffhausen[1], J. Miller[2], A. Matas[3], A. Israni[4], A. Wey[5], A. Hart[4], *[1]Hennepin Healthcare Research Institute / University of Minnesota (UMN), Minneapolis, MN, [2]Chronic Disease Research Group, Minneapolis, MN, [3]Department of Surgery, UMN, Minneapolis, MN, [4]Hennepin Healthcare / UMN, Minneapolis, MN, [5]Scientific Registry of Transplant Recipients, Minneapolis, MN*

861 **Outcomes After Usage of Organs from Deceased Organ Donors with Sepsis - A Single-center Experience**

A. Sharma[1], D. Choudhary[1], D. Kenwar[1], S. Singh[1], S. kumar[1], K. jain[2], N. Bansal[3], A. Ravi[1], *[1]Renal & Pancreas Transplant Surgery, Postgraduate Institute of Medical Education and Research, Chandigarh, Chandigarh, India, [2]Anesthesiology, Postgraduate Institute of Medical Education and Research, Chandigarh, Chandigarh, India, [3]Transplant Coordinator, Postgraduate Institute of Medical Education and Research, Chandigarh, Chandigarh, India*

862 **Poor Reliability of Karnofsky Performance Score in Kidney Transplant Candidates**

M. R. Stedman, D. J. Watford, G. M. Chertow, J. C. Tan, *Medicine, Stanford University, Palo Alto, CA*

863 **Use of Hepatitis B N.A.T. Positive Kidneys in Hepatitis B Immune Recipients**

E. Stephenson[1], B. Nangunuri[2], T. McCune[3], *[1]Nephrology and Critical Care, Eastern Virginia Medical School, Norfolk, VA, [2]Eastern Virginia Medical School, Norfolk, VA, [3]Nephrology, Eastern Virginia Medical School, Norfolk, VA*

864 **Can Procurement Biopsy Data Tell Us Anything? The Influence of Interstitial Fibrosis on Long-term Kidney Graft Survival**

D. Stewart[1], J. Foutz[1], L. Kamal[2], H. McGehee[1], P. Saravanane[2], S. Yu[3], R. Yousfi[2], G. Gupta[2], *[1]Research, United Network for Organ Sharing, Richmond, VA, [2]Virginia Commonwealth University Health, Richmond, VA, [3]Research, Virginia Commonwealth University Health, Richmond, VA*

865 **The Impact of High Kdpi on 1-year Post-transplant Graft Function and Survival in a Brazilian Cohort**

H. Tedesco Silva Junior, R. Demarchi Foresto, M. Hazin, B. Cassão, A. Aquino, J. Taddeo, C. Rosso Felipe, L. Requião Moura, J. Medina, *Núcleo de Ensino e Pesquisa, Hospital do Rim, Universidade Federal de São Paulo, São Paulo, Brazil*

866 **The Edge of Glory: Determinants of Success and Failure for Prolonged Cold Ischemia in Kidney Transplantation**
A. Turner[1], M. Hamidi[1], V. Ariyamuthu[2], R. Harland[1], B. Tanriover[2], *[1]Surgery, Banner University of Arizona Medical Center, Tucson, AZ, [2]Medicine, Banner University of Arizona Medical Center, Tucson, AZ*

867 **Long Term Outcomes of Kidney Transplantation from Deceased Donors with Terminal Acute Kidney Injury**
J. Rogers[1], R. Stratta[2], A. Farney[2], G. Orlando[2], C. Jay[2], A. Reeves-Daniel[3], A. Mena-Gutierrez[3], N. Sakhovskaya[3], K. Gurung[2], B. Sharda[2], J. Rogers[2], *[1]Surgery, Wake Forest School of Medicine, Winston Salem, NC, [2]Surgery, Wake Forest Baptist Medical Center, Winston Salem, NC, [3]Internal Medicine, Wake Forest Baptist Medical Center, Winston Salem, NC*

Kidney Immunosuppression: Desensitization

913 **Deceased Donor Transplantation Across Positive Flow Crossmatch - A Single Center Experience**
M. Campara, A. Lichvar, J. Benken, S. Patel, C. Muran, D. Pierce, I. Tang, P. Di Cocco, J. Almario Alvarez, M. Spaggiari, E. Benedetti, I. Tzvetanov, *University of Illinois at Chicago, Chicago, IL*

914 **Iguratimod Reduce Panel Reactive Antibody in High Mismatched Renal Transplant Recipients: A Retrospective Propensity Score-Matched Study**
D. Feng, Z. Wang, Z. Han, J. Tao, X. Ju, R. Tan, M. Gu, *The First Affiliated Hospital of Nanjing Medical University, Nanjing, China*

916 **Immunosuppression Regimen and Risk of Posttransplant Diabetes Among Older Kidney Transplant Recipients**
K. Lentine[1], J. Ahn[2], M. McAdams Demarco[2], H. Xiao[1], S. Bunnapradist[3], D. Segev[2], D. Axelrod[1], S. Bae[2], V. Dharnidharka[4], Y. Caliskan[1], S. Chang[4], G. Hess[5], J. Snyder[6], M. Schnitzler[1], *[1]Saint Louis Univ, Saint Louis, MO, [2]Johns Hopkins, Baltimore, MD, [3]Univ of California, Los Angeles, Los Angeles, CA, [4]Washington Univ, Saint Louis, MO, [5]Drexel Univ, Philadelphia, PA, [6]SRTR, Minneapolis, MN*

917 **Desensitization with Plasmapheresis and IV Immunoglobulin is Safe and Effective in Pra Positive Kidney Transplant Recipient Candidates in Covid-19 Pandemic Period**
B. Sayin[1], A. Akdur[2], E. Karakaya[2], U. Musabak[3], T. Colak[1], M. Haberal[2], *[1]Department of Nephrology, Baskent University, Ankara, Turkey, [2]Division of Transplantation, Department of General Surgery, Baskent University, Ankara, Turkey, [3]Department of Immunology, Baskent University, Ankara, Turkey*

918 **Safety and Tolerability of Tacrolimus Extended-Release (astagraf Xl) in Hla Sensitized Kidney Transplant Recipients: A Single Center Experience**
A. A. Vo, N. Ammerman, E. Huang, A. Peng, R. Najjar, S. Sethi, K. Lim, M. Gillespie, S. C. Jordan, *Cedars Sinai Medical Ctr, Los Angeles, CA*

Kidney Immunosuppression: Induction Therapy

919 **A Question with Multiple Answers: Do Renal Transplant Recipients Require Steroid Maintenance Following Thymoglobulin Induction?**
A. Aala, H. Patel, F. Cardarelli, *Beth Israel Deaconess Medical Center, Boston, MA*

920 **A Comparative Analysis of Kidney Allograft Outcomes in Steroid Use versus Steroid Discontinuation After Basiliximab Induction: Unos Data Base Study**
F. Cardarelli, H. Patel, A. Aala, *Nephrology, BIDMC, Boston, MA*

921 **Cost Savings Initiative with Idea Body Weight Dosing of Rabbit Antithymocyte Globulin (rATG) Induction in an Older Kidney Transplant Population: A Single Center Analysis**
C. LaFratte[1], S. Witek[1], D. Sawinski[2], J. Trofe-Clark[2], C. Sammons[2], B. Hardek[1], R. Samudralwar[1], A. Forte[1], S. Lyle[1], J. Rashid[1], G. Malat[2], *[1]Pharmacy, Hospital of Univ of Pennsylvania, Philadelphia, PA, [2]Penn Transplant Institute, Hospital of Univ of Pennsylvania, Philadelphia, PA*

922 **The Impact of Fixed-Dose Alemtuzumab in Renal Transplant Recipients According to Weight**
S. Mandala[1], N. Khodieva[2], A. Bigness[1], S. Mohamed[2], H. Mohammed[1], K. Robichaux[2], A. Brueckner[3], R. Baliga[4], J. Buggs[5], A. Kumar[1], L. Bowman[3], *[1]Morsani College of Medicine, University of South Florida, Tampa, FL, [2]Honors College, University of South Florida, Tampa, FL, [3]Transplant Pharmacy, Tampa General Hospital, Tampa, FL, [4]Nephrology, Florida Kidney Physicians, Tampa, FL, [5]Transplant Surgery, Tampa General Hospital, Tampa, FL*

923 **Rabbit Anti-thymocyte Globulin Induction Dosing Strategies in a High-risk Kidney Transplant Population**
C. Nguyen, R. Yau, C. Tunwar, *Pharmacy, CHI Baylor St. Luke's Medical Center, Houston, TX*

924 **Preemptive Second Kidney Transplant Outcomes by Induction Type in the United States**
S. Riad[1], G. Larrieux[2], S. Jackson[3], R. Kandaswamy[2], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Surgery, University of Minnesota, Minneapolis, MN, [3]Complex Care Analytics, M-Health Fairview, Minneapolis, MN*

925 **Outcomes of Second Kidney Transplant After Return to Dialysis by Induction Type in the United States**
S. Riad[1], T. Shaker[1], S. Jackson[2], R. Kandaswamy[3], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Complex Care Analytics, M-Health Fairview, Minneapolis, MN, [3]Surgery, University of Minnesota, Minneapolis, MN*

926 **Outcomes in Standard vs. Extended Use of Thymoglobulin as Induction Therapy in Kidney Transplant Recipients**
N. M. Sifontis[1], A. Coleman[1], D. Tang[1], K. Lau[2], S. Karhadkar[2], A. DiCarlo[2], A. Diamond[2], *[1]Temple University School of Pharmacy, Philadelphia, PA, [2]Temple University Health System, Philadelphia, PA*

927 **Sirolimus (srl) versus Everolimus (evr) versus Mycophenolate (mpa) in Kidney Transplant Recipients Receiving Anti-thymocyte Globulin Induction (r-atg), Tacrolimus (tac), and Prednisone**
H. Tedesco Silva Junior, C. Felipe, L. Viana, M. Cristelli, N. Tenorio, V. Lima, V. Azevedo, K. Ficher, J. Rezende, R. Foresto, M. Nakamura, Y. Dreige, J. Taddeo, C. Zito, J. Medina, *Hospital do Rim, Universidade Federal de São Paulo, São Paulo, Brazil*

LB 78 **Alemtuzumab vs Antithymocyte Globulin Induction in Hepatitis C Viremic Donors to Hepatitis C Negative Kidney Transplant Recipients**
K. Walter, L. Mincemoyer, J. Giang, J. Suero, N. Shah, K. Szempruch, *University of North Carolina Medical Center, Chapel Hill, NC*

Kidney Immunosuppression: Novel Regimens and Drug Minimization

928 **Effect of Early Steroid Withdrawal on Posttransplant Diabetes Mellitus Among Kidney Transplant Recipients Differs by Recipient Age**
J. Ahn[1], S. Bae[1], M. Schnitzler[2], G. Hess[3], K. Lentine[2], D. Segev[1], M. McAdams-DeMarco[1], *[1]Johns Hopkins University, Baltimore, MD, [2]Saint Louis University, St. Louis, MO, [3]Drexel University, Philadelphia, PA*

929 **Evaluation of Rituximab-abbs in Renal Transplant: A Case Series**
A. Dao[1], B. Jimenez[2], A. Reyad[1], J. Guiteau[1], M. Madhrira[3], N. Umezurike[1], S. Patel[1], S. Allam[3], *[1]Transplant, Medical City Fort Worth, Fort Worth, TX, [2]College of Pharmacy, University of North Texas, Fort Worth, TX, [3]Tarrant Nephrology Associates, Premier Physicians Group Health, Fort Worth, TX*

930 **Evaluation of Conversion to Extended-Release Tacrolimus in Abdominal Organ and Thoracic Transplant Recipients**
A. Diamond[1], N. Agarwal[2], A. Younas[2], N. Sifontis[2], J. Au[1], C. Ruggia-Check[1], *[1]Pharmacy, Temple University Hospital, Philadelphia, PA, [2]Pharmacy, Temple University School of Pharmacy, Philadelphia, PA*

931 **Belatacept Conversion in Elderly Renal Transplant Recipients**

M. Durst[1], D. Felix[1], M. Jorgenson[1], J. Descourouez[1], B. C. Astor[2], D. Mandelbrot[2], *[1]UW Health, Madison, WI, [2]University of Wisconsin School of Medicine and Public Health, Madison, WI*

932 **Avoiding Tacrolimus Under- and Overexposure with a Dosing Algorithm for Renal Transplant Recipients: A Single Arm Prospective Intervention Trial**

M. I. Francke[1], L. M. Andrews[2], H. L. Le[2], J. van de Wetering[1], M. C. Clahsen-van Groningen[3], T. van Gelder[4], R. H. van Schaik[5], B. van der Holt[6], B. C. de Winter[2], D. A. Hesselink[1], *[1]Internal medicine, nephrology and transplantation, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [2]Hospital Pharmacy, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [3]Pathology, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [4]Clinical Pharmacy and Toxicology, Leiden University Medical Center, Leiden, Netherlands, [5]Clinical Chemistry, Erasmus MC, University Medical Center, Rotterdam, Netherlands, [6]Hematology, Erasmus MC, University Medical Center, Rotterdam, Netherlands*

933 **Calcineurin Inhibitor Dose and Selection, Not Antiproliferatives or Steroids, Influence Development of DSA One Year Post-kidney Transplant**

M. Henderson[1], G. Morris[2], L. Awdishu[1], K. Fabbri[1], M. Shah[3], A. Khan[3], J. Kerr[1], *[1]Pharmacy, University of California San Diego Health, San Diego, CA, [2]Pathology, University of California San Diego Health, San Diego, CA, [3]Nephrology, University of California San Diego Health, San Diego, CA*

935 **Early Conversion to Belatacept-based Therapy Improves Graft Function in Renal Transplant Patients**

N. Huang[1], C. J. Yang[2], I. Movileanu[1], R. H. Dvorai[3], K. M. Ecal[1], R. F. Saidi[1], A. N. Ayla Senay[1], B. Gallay[4], M. J. Hanlon[1], S. Narsipur[4], M. R. Laftavi[1], R. Shahbazov[1], *[1]Surgery, SUNY Upstate Medical University, Syracuse, NY, [2]Pharmacy, SUNY Upstate Medical University, Syracuse, NY, [3]Pathology, SUNY Upstate Medical University, Syracuse, NY, [4]Medicine, SUNY Upstate Medical University, Syracuse, NY*

936 **Tolerability of De Novo and Conversion Belatacept Regimens in Kidney Transplantation**

T. Le[1], J. Shoji[2], J. Phillips[1], D. Quan[1], *[1]Pharmaceutical Services, UCSF Medical Center, San Francisco, CA, [2]Transplant Nephrology, UCSF Medical Center, San Francisco, CA*

937 **Belatacept Utilization During the Covid-19 Pandemic in the United States**

M. MacConmara, A. Shubin, D. Wojciechowski, L. de Gregorio, J. Shah, P. Vagefi, C. S. Hwang, *Department of Surgery, Division of Surgical Transplantation, University of Texas Southwestern Medical Center, Dallas, TX*

938 **Association of Belatacept Conversion on Patient and Allograft Survival in Kidney Transplant Recipients with Congestive Heart Failure**

H. Mogallapalli, *Department of Medicine, University of Wisconsin-Madison, Madison, WI*

939 **Modeling of Alternative Weight-Based Dosing Strategies of LCP-Tacrolimus in De Novo Kidney Transplant Patients**

J. D. Momper[1], S. J. Patel[2], M. A. Moten[2], D. R. Stevens[2], U. Meier-Kriesche[2], *[1]Skaggs School of Pharmacy and Pharmaceutical Sciences, University of California San Diego, La Jolla, CA, [2]Medical Affairs, Veloxis Pharmaceuticals, Cary, NC*

940 **Evaluation of Empiric Extended-Release Tacrolimus Dosing in Adult Kidney Transplant Recipients**
C. Patel, S. Lee, D. M. Salerno, N. W. Lange, J. Hedvat, *Pharmacy, NewYork-Presbyterian Hospital, New York, NY*

941 **Obesity Impacts Acute Rejection but Not Allograft Function Improvement in the Setting of Belatacept Conversion**
D. Pierce, J. Benken, P. West-Thielke, I. Tzvetanov, E. Benedetti, A. Lichvar, *University of Illinois at Chicago, Chicago, IL*

942 **Kidney Transplant Outcomes Stratified by Race with a Calcineurin and Steroid Free Regimen**
R. E. Scalzo, M. T. Harris, J. D. Morris, J. S. Byrns, *Pharmacy, Duke University Medical Center, Durham, NC*

943 **Kidney Transplant Outcomes Stratified by Age with a Calcineurin and Steroid Free Regimen**
R. Scalzo[1], M. Harris[1], J. Morris[2], J. Byrns[1], *[1]Pharmacy, Duke University Hospital, Durham, NC, [2]Nephrology, Duke University Hospital, Durham, NC*

944 **Sharp Anti-HLA Antibody Development Due to Concomitant Graft Nephrectomy and Immunosuppression Withdrawal After Early Graft Loss**
R. Valero[1], A. Aguilera[1], E. Rodrigo[1], D. San Segundo[2], M. Lopez-Hoyos[2], J. Ruiz[1], *[1]Nefrología, Hospital Universitario Marqués de Valdecilla, Santander, Spain, [2]Inmunología, Hospital Universitario Marqués de Valdecilla, Santander, Spain*

945 **Tolerability of Mycophenolate Mofetil in Elderly Kidney Transplant Recipients: A Retrospective Cohort Study**
S. Witek[1], G. Malat[2], D. Sawinski[2], C. Sammons[2], C. LaFratte[1], A. Forte[1], R. Samudralwar[1], S. Lyle[1], J. Rashid[1], J. Trofe-Clark[2], *[1]Dept of Pharmacy, Hospital of the Univ of Pennsylvania, Philadelphia, PA, [2]Penn Transplant Institute, Hospital of the Univ of Pennsylvania, Philadelphia, PA*

946 **Tacrolimus Variability Score Outperforms Coefficient of Variation in Predicting Clinical Outcomes of Living Kidney Transplantation**
S. Yin, T. Song, Q. Zhong, T. Lin, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

Kidney Living Donor: Long Term Outcomes

947 **Frailty Component Trajectories Among Kidney Transplant Recipients**
N. Chu, X. Chen, D. Segev, M. McAdams-DeMarco, *Johns Hopkins, Baltimore, MD*

948 **Different Levels of GFR of Retained Kidney on the Long-term Safety of the Donors in Living-related Renal Transplantation**
M. Dou, P. Tian, B. Zheng, G. Deng, Y. Shi, C. Ding, *The First Affiliated Hospital of Xi'an Jiaotong University, Xi'an, China*

949 **Factors Affecting Sensitization Following Kidney Allograft Failure**
N. Garg, L. Hidalgo, S. Parajuli, F. Aziz, M. Mohamed, A. Djamali, D. Mandelbrot, *UW Madison, Madison, WI*

950 **Pill Burden in Belatacept versus Tacrolimus-Based Immunosuppression**
S. Gattis, L. Lakhani, A. Basu, *Emory Healthcare, Atlanta, GA*

951 **Creatinine Reduction Ratio at 2 Postoperative Day as a Predicting Factor of Long-Term Outcomes After Living Donor Kidney Transplantation**
Y. Kinoshita, T. Shinzato, T. Shimizu, D. Iwami, *Division of Renal Surgery and Transplantation, Department of Urology, Jichi Medical University Hospital, Shimotsuke, Tochigi, Japan*

952 **The Impact of Diabetes on Young Transplant Recipients: An American Perspective**
J. M. Loera, S. C. Barrett, T. S. Zhang, A. A. Awan, B. V. Murthy, R. T. Cotton, C. A. O'Mahany, N. T. Galvan, J. A. Goss, A. A. Rana, *Michael E. DeBakey Department of Surgery, Baylor College of Medicine, Houston, TX*

953 **Patient Survival After Living Donor Kidney Donation**
M. G. Naik, K. Sakurayama, K. Budde, F. Halleck, *Medical Department, Division of Nephrology and Internal Intensive Care Medicine, Charité, Berlin, Germany*

954 **Awareness of Teratogenic Potential of Mycophenolic Acid Products and Pregnancy Outcomes in Kidney Transplant Recipients**
S. Rao[1], L. Coscia[2], A. Yusuf[2], S. Constantinescu[3], M. J. Moritz[4], *[1]Nephrology, University of Virginia Heath System, Charlottesville, VA, [2]Transplant Pregnancy Registry International, Philadelphia, PA, [3]Medicine, Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [4]Surgery, Lehigh Valley Health Network, Allentown, PA*

955 **Very Long-Term Patient and Kidney Allograft Outcomes in Kidney Transplant Recipients More Than 20 Years After Transplantation:**
T. Schachtner, A. Reimann, T. Müller, *University Hospital Zurich, Zürich, Switzerland*

956 **Impact of Rituximab Induction Therapy on Donor-specific Anti-HLA Antibodies in Abo-compatible Kidney Transplant Recipients**
T. Yagisawa[1], T. Kanzawa[1], K. Unagami[2], M. Furusawa[1], M. Inui[1], H. Ishida[2], K. Tanabe[1], *[1]Department of Urology, Tokyo Women's Medical University, Tokyo, Japan, [2]Department of Organ Transplant Medicine, Tokyo Women's Medical University, Tokyo, Japan*

Kidney Living Donor: Other

957 **Graft Volume Changed in the First Year After Living Donor Kidney Transplantation**
M. Abou Zeinab, M. Eltemamy, Y. Lin, K. Sasaki, V. Krishnamurthi, Z. Zaky, A. Wee, J. Kaouk, *Cleveland Clinic, Cleveland, OH*

958 **Modifiable Barriers in Decision Making Around Living Donor Kidney Transplantation - A Rapid Scoping Review to Guide (DEAL-KD) Study**
A. Ahmed[1], A. Winterbottom[1], S. Ahmed[2], J. Stoves[3], S. Daga[1], *[1]Leeds Teaching Hospitals Trust, Leeds, United Kingdom, [2]Division of Psychological and social Medicine, University of Leeds, Leeds, United Kingdom, [3]Bradford Teaching Hospitals NHS Foundation Trust, Bradford, United Kingdom*

959 **Seasonal and Income-related Factors in Live Kidney Donation in the United States from 1995 to 2019**
F. Al Ammary[1], A. Arking[2], G. Kaddu[2], J. Garonzik Wang[2], A. B. Massie[2], D. Segev[2], A. Muzaale[2], *[1]Medicine, Johns Hopkins University, Baltimore, MD, [2]Surgery, Johns Hopkins University, Baltimore, MD*

960 **Decreased Pca and Regional Anesthesia Requirements Following Robotic Donor Nephrectomy**
J. C. Alonso-Escalante, L. Machado, K. R. Tabar, R. P. Tindall, N. Thai, T. Uemura, *Surgery, Allegheny General Hospital, Pittsburgh, PA*

961 **Kidney Transplantation in Patients with Hereditary Kidney Diseases**
Y. Caliskan[1], N. Garayeva[2], A. B. Dirim[2], S. Safak[2], S. Mirioglu[2], H. Yazici[2], A. Yildiz[3], O. A. Oto[2], E. Demir[2], Y. Ozluk[4], A. Turkmen[2], K. Lentine[1], *[1]Saint Louis University, Saint Louis, MO, [2]Division of Nephrology, Istanbul University, Istanbul, Turkey, [3]Division of Nephrology, Uludag University, Bursa, Turkey, [4]Department of Pathology, Istanbul University, Istanbul, Turkey*

962 **Effects of Transverse Abdominis Plane Blocks on Opioid Requirements Post Kidney Donation**
R. Caputo, O. Witkowsky, A. Rajab, *The Ohio State University Wexner Medical Center, Columbus, OH*

963 **The Impact of Donor Age and Donor-Recipient Age Difference on Living Donor Kidney Transplantation**

T. Hiramitsu[1], T. Tomosugi[2], K. Futamura[2], M. Okada[2], N. Goto[2], T. Ichimori[2], S. Narumi[2], Y. Watarai[2], *[1]Nagoya Daini Red Cross Hospital, Myokencho Showaku, Japan, [2]Nagoya Daini Red Cross Hospital, Nagoya, Japan*

964 **The Impact of Living Donors Aged 70 and Older on Living Donor Kidney Transplantation**

T. Hiramitsu, T. Tomosugi, K. Futamura, M. Okada, N. Goto, T. Ichimori, S. Narumi, Y. Watarai, *Nagoya Daini Red Cross Hospital, Nagoya Aichi, Japan*

965 **Identifying Health-System Level Barriers and Facilitators to Living Donor Kidney Transplantation: A Comparative Case Study**

A. Horton[1], M. Fortin[2], P. Nugus[3], D. Landsberg[4], M. Paquet[2], M. Cantarovich[1], S. Sandal[1], *[1]Nephrology, McGill University Health Centre, Montreal, QC, Canada, [2]Nephrology, Centre Hospitalier de l'Université de Montréal, Montreal, QC, Canada, [3]Family Medicine, McGill University, Montreal, QC, Canada, [4]Nephrology, University of British Columbia, Vancouver, BC, Canada*

966 **The Evaluation of Living-Related Kidney Transplantation Donors in Autosomal-Dominant Polycystic Kidney Disease**

T. Kikuchi[1], K. Unagami[2], Y. Kobari[3], T. Yagisawa[3], T. Kanzawa[3], K. Omoto[3], A. Uemura[1], H. Ishida[2], K. Tanabe[3], *[1]Urology, Kindai University Hospital, Osaka, Japan, [2]Organ transplant medicine, Tokyo Women's Medical University Hospital, Tokyo, Japan, [3]Urology, Tokyo Women's Medical University Hospital, Tokyo, Japan*

967 **Developing a Robot-assisted Donor Nephrectomy Program in a High Volume Laparoscopic Living Donor Nephrectomy Program**

S. S. Lee[1], N. Vachharajani[2], M. Pfeiffer[2], S. Matson[2], M. Scherer[2], M. Doyle[2], J. Wellen[2], Y. Lin[2], T. Rice[2], J. Yu[2], A. Khan[2], *[1]Abdominal Transplant Surgery, Baylor University Medical Center, Dallas, TX, [2]Abdominal Transplant Surgery, Washington University at St. Louis, St Louis, MO*

968 **Alterations in Mineral Metabolism of Living Kidney Donors: Prospective Observational Study**

H. Lee[1], E. Ko[1], H. Cho[2], C. Yang[1], B. Chung[1], *[1]Division of Nephrology, Department of Internal Medicine, Seoul St. Mary's Hospital, Seoul, Korea, Republic of, [2]Department of Urology, Seoul St. Mary's Hospital, Seoul, Korea, Republic of*

969 **Kidney Transplant Associated Allergy Transfer After Living Donation**

K. López-Vega, S. Davis, *Division of Renal Diseases and Hypertension, Anschutz Medical Campus, University of Colorado, Aurora, CO*

970 **Which Living Kidney Donors Arrive to the Donation Process Informed About Surgery?**

L. Malinzak, A. Segal, R. Prashar, M. Jesse, *Henry Ford Hospital, Detroit, MI*

971 **Multimodal Analgesia Reduces Length of Stay in Living Kidney Donors**

K. Marti[1], D. O'Sullivan[2], X. Ye[3], C. Rochon[3], H. Kutzler[3], *[1]Pharmacy, Hartford Hospital, Hartford, CT, [2]Research Administration, Hartford Hospital, Hartford, CT, [3]Transplant, Hartford Hospital, Hartford, CT*

972 **Preempting Misconceptions: An Educational Initiative for Preemptive Kidney Transplant Candidates**

T. Menser[1], M. Hobeika[2], H. Ibrahim[2], A. Khan[1], B. Cruz[2], J. Sharp[2], A. Gaber[2], *[1]Houston Methodist Research Institute, Houston, TX, [2]Houston Methodist Hospital, Houston, TX*

973 **Clinical Outcomes of Living Kidney Transplantation from Elderly Spousal Donors**

Y. Miyauchi, T. Noda, N. Miura, T. Kikugawa, T. Saika, *Ehime University, Toon, Japan*

974 **A Dynamic Markov Model to Assess the Cost-Effectiveness of the Kidney Team at Home Intervention in the Netherlands**

S. Redeker[1], S. Ismail[1], H. van Eeren[1], E. K. Massey[2], W. Weimar[2], M. Oppe[3], J. van Busschbach[1], *[1]Psychiatry, Erasmus MC, Rotterdam, Netherlands, [2]Internal Medicine, Erasmus MC, Rotterdam, Netherlands, [3]Axentiva Solutions S.L., Tacoronte, Spain*

975 **Implementation of the Kidney Team at Home Intervention: Evaluating Generalizability, Implementation Process, and Effects**

S. Redeker[1], S. Ismail[1], R. Timman[1], J. van Busschbach[1], C. Boonstra[2], H. F. Brulez[3], D. A. Hollander[4], L. Hilbrands[5], F. J. Bemelman[6], S. P. Berger[7], J. van der Wetering[8], R. A. van den Dorpel[9], M. A. Jansen-Dekker[10], W. Weimar[8], E. K. Massey[8], *[1]Psychiatry, Erasmus MC, Rotterdam, Netherlands, [2]De Viersprong, Rotterdam, Netherlands, [3]Internal Medicine, OLVG, Amsterdam, Netherlands, [4]Internal Medicine, JBZ, Den Bosch, Netherlands, [5]Internal Medicine, Radboud UMC, Nijmegen, Netherlands, [6]Internal Medicine, Amsterdam UMC, Amsterdam, Netherlands, [7]Internal Medicine, UMCG, Groningen, Netherlands, [8]Internal Medicine, Erasmus MC, Rotterdam, Netherlands, [9]Internal Medicine, Maasstad Ziekenhuis, Rotterdam, Netherlands, [10]Internal Medicine, ZGT, Almelo, Netherlands*

976 **Living Donor Total Robotic Renal Transplantation: Early Single Center Experience**

M. E. Tobon Lascano, S. Koganti, M. E. Akoad, M. Anastopoulos, C. J. Simon, B. A. Bouthot, E. D. Walshe, Y. L. Cheah, *Transplant, Lahey Clinic, Burlington, MA*

Kidney Living Donor: Selection

1000 **The Differential Impact of Size Mismatch in Live versus Deceased Donor Kidney Transplant**

A. J. Vinson[1], T. Skinner[2], B. Kiberd[3], D. Clark[1], K. Tennankore[1], *[1]Division of Nephrology, Department of Medicine, Nova Scotia Health Authority, Halifax, NS, Canada, [2]Department of Urology, Nova Scotia Health Authority, Halifax, NS, Canada, [3]Dalhousie University, Halifax, NS, Canada*

1001 **Pediatric Kidney Transplant Strategy: The Sequence Effect**

A. J. Vinson[1], B. Kiberd[2], P. Acott[3], K. Tennankore[1], *[1]Nova Scotia Health Authority Division of Nephrology, Departm, Halifax, NS, Canada, [2]Dalhousie University, Halifax, NS, Canada, [3]IWK Health Center, Halifax, NS, Canada*

994 **Barriers to Living Kidney Donation: A Closer Look at Declined Donors**

M. Anand, S. Barhorst, S. Bumb, B. Abu Jawdeh, T. Kaur, A. Govil, *University of Cincinnati, Cincinnati, OH*

995 **Development and Validation of a Nomogram for Remnant Kidney Function After Living-donor Donation**

M. Dou, P. Tian, B. Zheng, G. Deng, Y. Shi, C. Ding, *The First Affiliated Hospital of Xi'an Jiaotong University, Xi'an, China*

996 **Body Surface Adjusted vs Raw GFR in Predicting Long Term Outcomes of Kidney Donors. Who is Disadvantaged?**

H. N. Ibrahim[1], S. A. Hebert[1], H. E. Adrogue[1], D. Murad[1], D. T. Nguyen[2], E. A. Graviss[2], *[1]Medicine, Houston Methodist Hospital, Houston, TX, [2]Pathology and Genomic Medicine, Houston Methodist Hospital, Houston, TX*

997 **Criteria and Practice Patterns for Accepting Living Donors with Prior Covid-19: A National Survey**

A. Jawed[1], M. Y. Jan[2], N. Barros[2], O. Adebiyi[2], A. Diez[3], J. Fridell[2], W. Goggins[2], M. Yaqub[2], M. A. Mujtaba[4], T. Taber[2], V. Kumar[5], K. Lentine[6], A. Sharfuddin[2], *[1]Wayne State University, Detroit, IN, [2]Indiana University School of Medicine, Indianapolis, IN, [3]The Ohio State University, Columbus, OH, [4]UTMB Galveston, Galveston, TX, [5]University of Alabama, Birmingham, AL, [6]St. Louis University, St. Louis, MO*

999 **Early Experience with Broad Renal Genetic Testing in an Academic Transplant Center**

E. Tantisattamo[1], K. Brossart[2], N. Ioannou[2], S. McCormick[2], P. R. Billings[2], H. Tabriziani[2], *[1]Division of Nephrology, Hypertension and Kidney Transplantation, Division of Nephrology, Hypertension and Kidney Transplantation, Department of Medicine, University of California Irvine School of Medicine, Orange, CA, [2]Natera, Inc., San Carlos, CA*

Kidney Paired Exchange

1069 **An Early Look at the OPTN Kidney Paired Donation Pilot Program's New Priority Points Policy**

S. E. Booker[1], R. Leishman[1], D. E. Stewart[1], T. Sandholm[2], J. Dickerson[3], M. Pavlakis[4], V. Casingal[5], *[1]United Network for Organ Sharing, Richmond, VA, [2]Carnegie Mellon University, Pittsburgh, PA, [3]University of Maryland, College Park, MD, [4]Beth Israel Deaconess Medical Center, Boston, MA, [5]Carolinas Medical Center, Charlotte, NC*

1070 **Impact of Pre-Screening on OPTN Kidney Paired Donation Pilot Program Transplant and Refusal Rates**

S. E. Booker[1], R. Leishman[1], J. Musick[1], M. Oley[1], T. Sandholm[2], J. Dickerson[3], M. Pavlakis[4], V. Casingal[5], *[1]UNOS, Richmond, VA, [2]Carnegie Mellon University, Pittsburgh, PA, [3]University of Maryland, College Park, MD, [4]Beth Israel Deaconess Medical Center, Boston, MA, [5]Carolinas Medical Center, Charlotte, NC*

1071 **First Promising Results of CIAT: A New Kidney Exchange Program for Difficult-to-match Patients**

M. de Klerk[1], J. Kal[1], K. Glorie[2], D. Roelen[3], M. Betjes[1], J. Wetering van de[1], M. Kho[1], J. Roodnat[1], *[1]Erasmus MC, Rotterdam, Netherlands, [2]EQI, Erasmus University, Rotterdam, Netherlands, [3]LUMC, Leiden, Netherlands*

1072 **"I Would Do Whatever It Took": Understanding the Motivation, Education and Experiences of Kidney Paired Donation Participants**

R. Pines[1], Y. A. Iraheta[2], L. Ambriz[2], K. A. Dahmani[2], E. H. Wood[2], M. Cooper[3], A. D. Waterman[2], *[1]Santa Barbara Cottage Hospital, Santa Barbara, CA, [2]UCLA David Geffen School of Medicine, Los Angeles, CA, [3]Medstar Georgetown Transplant Institute, Washington, DC*

1073 **In Search of a Better Outcome: Opting Into the Live Donor Paired Kidney Exchange Program**

A. J. Vinson[1], B. Kiberd[2], K. J. Tennankore[1], *[1]Nova Scotia Health Authority Division of Nephrology, Departm, Halifax, NS, Canada, [2]Medicine, Dalhousie University, Halifax, NS, Canada*

LB 79 **Who Can be Matched via Kidney Exchange?**

D. C. McElfresh[1], M. Curry[2], S. E. Booker[3], D. Stewart[3], M. Stuart[3], R. Leishman[4], T. Sandholm[5], J. Dickerson[2], *[1]Applied Mathematics, University of Maryland, College Park, MD, [2]Computer Science, University of Maryland, College Park, MD, [3]United Network for Organ Sharing, Seattle, WA, [4]UNOS, Seattle, WA, [5]Computer Science, Carnegie Mellon University, Pittsburgh, PA*

Kidney Psychosocial

868 **Identifying Barriers to Transition Readiness in Pediatric Kidney Transplant Patients**

K. Amatya, S. Yuhas-Schiltz, C. Petyak, A. Moudgil, *Nephrology, Children's National Medical Center, Washington, DC*

869 **Greater Social Vulnerability is Associated with Self-advocacy in the Living Donor Navigator Program**

A. Carter, A. C. Kale, R. D. Reed, B. A. Shelton, H. Qu, M. C. McLeod, B. J. Orandi, R. M. Cannon, D. Anderson, P. MacLennan, V. Kumar, M. Hanaway, J. E. Locke, *University of Alabama at Birmingham Hospital, Birmingham, AL*

870 **Health-related Quality of Life (HRQoL) in Patients on Dialysis and Kidney Transplant Recipients - Experience with the PROMIS Global-10 Survey**

G. Chawla, W. Hajjar, M. Dastgheib, N. Yanga, G. Ahmadzadeh, N. El-Dassouki, A. Shahreza, N. Al Kaabi, N. Edwards, I. Mucsi, *University Health Network, Division of Nephrology and Multi-Organ Transplant Program, Toronto, ON, Canada*

871 **The Impact of Health Literacy on Kidney Transplant Listing**

G. Chen[1], J. Siahaan[2], L. Leon Novelo[2], I. Rizvi[3], A. M. De Golovine[4], A. R. Edwards[4], A. Pai[4], W. A. Dar[3], *[1]Abdominal Transplant, Memorial Hermann Hospital, Houston, TX, [2]Department of Biostatistics and Data Science, School of Public Health The University of Texas Health Science Center at Houston, Houston, TX, [3]Department of Surgery, McGovern Medical School The University of Texas Health Science Center at Houston, Houston, TX, [4]Department of Internal Medicine, Renal Diseases and Hypertension, McGovern Medical School The University of Texas Health Science Center at Houston, Houston, TX*

872 **Experiential Expertise: What Can Patients and Donors Teach Us About Living Donation?**

L. A. Davis[1], E. H. Wood[2], E. Ho[3], R. Pines[4], S. M. Advani[5], A. D. Waterman[2], *[1]DeSales University, Center Valley, PA, [2]UCLA David Geffen School of Medicine, Los Angeles, CA, [3]Terasaki Institute, Los Angeles, CA, [4]Santa Barbara Cottage Hospital, Santa Barbara, CA, [5]National Human Genome Research Institute, NIH, Bethesda, MD*

873 **Ambient Air Pollution and Changes in Cognitive Function Among Kidney Transplant Recipients**

Y. Feng[1], M. Jones[2], N. Chu[2], D. Segev[1], M. McAdams Demarco[1], *[1]Department of Surgery, Johns Hopkins School of Medicine, Baltimore, MD, [2]Department of Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, MD*

874 **True Living Donation Experiences: A Thematic Analysis of Storytelling from Kidney Living Donors**

E. Ho[1], E. H. Wood[2], R. Pines[3], L. A. Davis[4], S. M. Advani[5], A. D. Waterman[2], *[1]Terasaki Institute, Los Angeles, CA, [2]UCLA David Geffen School of Medicine, Los Angeles, CA, [3]Cottage Hospital, Santa Barbara, CA, [4]DeSales University, Center Valley, PA, [5]National Human Genome Research Institute (NIH), Bethesda, MD*

875 **Association of Kidney Function with Patient Reported Outcomes After Kidney Transplantation**

G. S. Kochar, S. A. Rega, I. D. Feurer, A. Dreher, H. Schaefer, D. Shaffer, R. C. Forbes, C. W. Pinson, B. P. Concepcion, *Nephrology, Vanderbilt University Medical Center, Nashville, TN*

876 **Attitudes of Obese Kidney Transplant Candidates Towards Bariatric Surgery**

C. LaVerne, V. Thompson, G. Aguiluz, P. DiCocco, J. Almario Alvarez, M. Spaggiari, I. Tang, I. Tzvetanov, E. Benedetti, *Surgery, University of Illinois Hospital & Health Sciences System, Chicago, IL*

877 **Current Opioid Utilization Practices of Kidney Transplant Centers in the United States: A National Survey of Institutional Practices**

A. Lichvar[1], H. Kim[1], A. Ingemi[2], J. Jarrett[1], *[1]University of Illinois at Chicago, Chicago, IL, [2]Sentara Healthcare, Norfolk, VA*

878 **Covid-19-related Knowledge, Health Behaviors and Attitudes Towards Telemedicine and Emergency Visits in a Population of Kidney Transplant (KTx) Recipients**

A. Lin, M. Saw-Aung, W. Yang, G. Udod, A. Imas, M. Markell, *SUNY Downstate Health Sciences University, Brooklyn, NY*

879 **Identifying the Needs of Kidney Transplant Recipients That Can be Addressed by a Web-based Self-management Program**

D. Massierer[1], R. Sapir-Pichhadze[2], V. Bouchard[3], K. Dasgupta[2], N. Fernandez[4], D. da Costa[2], S. Ahmed[1], M. Fortin[5], R. Langevin[6], N. Mayo[1], T. Janaudis-Ferreira[1], *[1]Faculty of Medicine- School of Physical and Occupational Therapy, McGill University, Montreal, QC, Canada, [2]Centre for Outcomes Research and Evaluation (CORE), Research Institute of the McGill University Health Centre (RI-MUHC), Montreal, QC, Canada, [3]CIUSSS du Saguenay-Lac-Saint-Jean, Chicoutimi, QC, Canada, [4]Department of Family Medicine/Emergency Medicine, Université de Montreal, Montreal, QC, Canada, [5]Department of Medicine, Université de Montreal, Montreal, QC, Canada, [6]Canadian Donation and Transplantation Research Program (CDTRP), Edmonton, AB, Canada*

880 **Intersecting Disparities in Health Literacy Among Renal Patients Experiencing Transplant Barriers**

C. W. Nonterah, K. Workman, S. Shah, *Psychology, University of Richmond, Richmond, VA*

881 **Understanding Early Transplant Preparation: CKD 3-5 Patients' Transplant Knowledge and Actions at Kaiser Permanente Southern California**

R. Pines[1], S. H. Kawakita[2], G. H. Kim[3], O. Ranasinghe[4], B. Mittman[5], B. Dub[5], H. Wilhalme[3], A. D. Waterman[3], *[1]Santa Barbara Cottage Hospital, Santa Barbara, CA, [2]Terasaki Institute, Los Angeles, CA, [3]UCLA David Geffen School of Medicine, Los Angeles, CA, [4]Outbreak Management Branch, Los Angeles County Department of Public Health, Los Angeles, CA, [5]Research and Evaluation, Kaiser Permanente, Pasadena, CA*

882 **Patients' Perceptions of Kidney Transplant Failure and Transitioning to Dialysis**

E. Ramos[1], C. Gu[2], C. Hanson[2], K. Abdel-Kader[3], K. Bonnet[2], D. Schlundt[2], E. Gordon[4], B. P. Concepcion[3], *[1]Cleveland Clinic Foundation, Cleveland, OH, [2]Vanderbilt University, Nashville, TN, [3]Vanderbilt University Medical Center, Nashville, TN, [4]Northwestern University, Chicago, IL*

883 **Impact of Pre- and Post-transplant Outcomes on Patient-reported Outcomes in a Prospective Multicenter Trial in Kidney Transplantation**

J. M. Rohan[1], J. P. Leone[2], E. Woodle[3], D. Kaufman[4], A. R. Shields[3], A. Wiseman[5], A. J. Matas[6], P. West-Thielke[7], E. King[3], R. R. Alloway[3], *[1]Children's Hospital Richmond VCU, Richmond, VA, [2]Tampa General, Tampa, FL, [3]U Cincinnati, Cincinnati, OH, [4]U Wisconsin, Madison, WI, [5]Centura Transplant, Denver, CO, [6]U Minnesota, Minneapolis, MN, [7]UIC, Chicago, IL*

884 **Validation of PROMIS Anxiety Computer Adaptive Test in Solid Organ Transplant Recipients**

M. Saqib, M. Yang, F. Jamal, S. Aghamohammadi, G. Ahmadzadeh, M. Hamid, V. Shah, N. Jayakumar, M. Novak, I. Mucsi, *University Health Network, Toronto, ON, Canada*

885 **Transplant Decision Making Concerns for Asian Patients with End-Stage Kidney Disease**

N. Singh[1], A. Wasim[1], G. Chawla[1], F. Jamil[1], M. Hamid[1], R. Siddiqui[1], E. Lui[1], N. El-Dassouki[1], M. Novak[1], A. D. Waterman[2], I. Mucsi[1], *[1]University Health Network, Toronto, ON, Canada, [2]David Geffen School of Medicine, UCLA, Los Angeles, CA*

886 **Information-Seeking Behavior During Covid-19: Opportunities for Communication and Care Transition Improvements**

S. H. Advani[1], S. M. Advani[2], Y. A. Iraheta[3], A. Murillo[4], H. A. Gritsch[3], A. D. Waterman[3], *[1]Terasaki Institute, Bethesda, MD, [2]National Human Genome Research Institute, Bethesda, MD, [3]UCLA, Los Angeles, CA, [4]Terasaki Institute, Los Angeles, CA*

Kidney Technical

977 **Detrusor Reinforced Lich-Gregoir Ureteroneocystostomy for Kidney Transplants Recipients: Comparative Analysis of the First 100 Cases**

R. H. Astolfi, J. Medina-Pestana, H. Tedesco Silva Junior, W. Aguiar, *Urology, Universidade Federal de São Paulo, São Paulo, Brazil*

978 **Single Center Experience in Ex Vivo Hilar Renal Artery Aneurysm Repair and Autotransplantation**

A. Chang[1], K. Cederquist[1], P. Abt[1], G. Wang[2], B. Jackson[2], A. Naji[1], *[1]Transplant Surgery, University of Pennsylvania, Philadelphia, PA, [2]Vascular Surgery, University of Pennsylvania, Philadelphia, PA*

979 **Initial Experience with Single-port Robotic-assisted Kidney Transplantation**

M. Eltemamy, A. Aminsharifi, Y. Lin, Z. Schwen, M. Abou Zeinab, V. Krishnamurthi, D. Goldfarb, A. Wee, J. Kaouk, *Cleveland Clinic, Cleveland, OH*

980 **Anterior Rectus Sheath versus Gibson Incision for Kidney Transplantation - University of Chicago Experience**

G. S. Generette, P. J. Bachul, P. E. Borek, K. Jayant, A. Perez-Gutierrez, B. Juengel, Y. T. Becker, R. Barth, J. Fung, P. Witkowski, *Surgery, University of Chicago, Chicago, IL*

981 **The Experience of 1000 Hand Assisted Laparoscopic Donor Nephrectomy for Living Donor Kidney Transplantation**

T. Hiramitsu[1], T. Tomosugi[2], K. Futamura[2], M. Okada[2], N. Goto[2], T. Ichimori[2], S. Narumi[2], Y. Watarai[2], *[1]Nagoya Daini Red Cross Hospital, Myokencho Showaku, Japan, [2]Nagoya Daini Red Cross Hospital, Nagoya, Japan*

982 **Urine Donor-derived Cell-free is Valuable for Predicting BK Polyomavirus-associated Nephropathy in Kidney Transplant Recipients**

G. Huang[1], X. Chen[1], Y. Huang[1], J. Li[1], R. Deng[1], W. Chen[2], J. Qiu[1], S. Deng[1], G. Chen[1], Q. Fu[1], C. Wu[1], J. Fei[1], L. Liu[1], L. Chen[1], C. Wang[1], *[1]Organ Transplant Center, The First Affiliated Hospital of Sun Yat-sen University, Guangzhou, China, [2]Department of Pathology, The First Affiliated Hospital of Sun Yat-sen University, Guangzhou, China*

983 **Single Incision Simultaneous Liver Kidney Transplantation: Outcomes and Feasibility**

D. Imai, Y. Sambommatsu, A. Khan, S. Lee, A. Sharma, V. Kumaran, D. Bruno, A. Cotterell, C. Bhati, M. F. Levy, *Virginia Commonwealth University, Richmond, VA*

984 **Is There a Role for Pre-Operative Angiographic Kidney Embolization Prior to Allograft Nephrectomy?**

M. Jacobs[1], R. Stratta[1], D. Harriman[2], A. Farney[1], J. Rogers[1], G. Orlando[1], A. Reeves-Daniel[1], C. Jay[1], *[1]Wake Forest Baptist Health, Winston Salem, NC, [2]University of British Columbia, Vancouver, BC, Canada*

985 **Robotic Assisted Donor Nephrectomy: A Single Center Experience**

A. Khan, A. Sharma, S. Lee, A. Cotterell, D. Kumar, L. Kamal, I. Moinuddin, D. Bruno, V. Kumaran, M. Levy, C. Bhati, *Transplant Surgery, Virginia Commonwealth University, Richmond, VA*

986 **Robotic versus Open Mini-incision Living Donor Nephrectomy: Single Center Experience**

S. Lee[1], S. Z. Wang[2], A. Khan[1], A. Sharma[1], D. Kumar[3], L. Kamal[3], A. Cotterell[1], V. Kumaran[1], D. Bruno[1], M. Levy[1], C. Bhati[1], *[1]Transplant Surgery, Virginia Commonwealth University hospital, Richmond, VA, [2]Medical School, Virginia Commonwealth University, Richmond, VA, [3]Transplant Nephrology, Virginia Commonwealth University hospital, Richmond, VA*

987 **Evaluation of the Impact of Delayed Graft Function (dgf) on Kidney Allograft Outcomes**
J. Leeds, B. Rawashdeh, M. Sestito, B. Sharma, J. Kamal, A. Kumar, A. AgarwalAA4VB, A. Doyle, S. Rao, *University of Virginia, Charlottesville, VA*

988 **Early Recovery After Surgery Protocol in Kidney Transplantation is Associated with Decreased Hospital Stay and Improved Clinical Outcomes**
Y. Lin, M. Eltemamy, K. Sasaki, V. Krishnamurthi, D. Goldfarb, A. Wee, *Cleveland Clinic, Cleveland, OH*

990 **Anterior Rectus Sheath versus Standard Gibson Approach to Kidney Transplantation: A Randomized Double-blinded Controlled Trial**
P. Murthy, M. Lyon, M. Fascelli, M. Spinner, E. Miller, Y. Lin, D. Goldfarb, V. Krishnamurthi, A. Wee, M. Eltemamy, *Glickman Urological and Kidney Institute, Cleveland Clinic, Cleveland, OH*

991 **Application of Incisional Wound Vac to Decrease Wound Complications and Surgical Site Infections: A Single Center Pilot Project**
E. K. Venniro, M. Dokus, J. Taylor, R. Kashyap, *University of Rochester Medical Center, Rochester, NY*

992 **Early Experience with Machine Retrograde Perfusion of Deceased Donor Kidneys: Short-term Outcomes of a Prospective Study**
J. Zeng, Q. Zhong, S. Yin, Z. Jia, Z. Huang, Y. Fan, X. Wang, T. Lin, T. Song, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

993 **Initial Experiment of Self-expanding Metal Ureteral Stent in Recurrent Ureteral Stenosis After Kidney Transplantation**
Q. Zhong, T. Song, J. Zeng, Y. Fan, X. Wei, T. Lin, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

Kidney: Acute Cellular Rejection

887 **How Should Acute T-Cell Mediated Rejection of Kidney Transplants be Treated?**
F. Aziz[1], S. Parajuli[2], N. Garg[2], M. Mohamed[2], A. Djamali[2], D. Mandelbrot[2], *[1]University of Wisconsin, Madison, WI, [2]University of Wisconsin, Verona, WI*

888 **Kidney Transplant Survival After Borderline Rejection in the Setting of Denovo Dsa Formation**
A. P. Bregman[1], S. Jackson[2], S. Riad[1], *[1]Department of Nephrology, University of Minnesota, Minneapolis, MN, [2]Biostatistics, M-Health Fairview Analytics, Minneapolis, MN*

889 **Impact of Induction Immunosuppression Selection on Clinical Outcomes in Kidney Transplant Recipients During the COVID-19 Pandemic in New York City**
K. Khalil, S. Jonchhe, J. Stern, T. C. Lewis, N. Alnazari, B. Lonze, Z. Stewart Lewis, N. Ali, *Transplant Institute, NYU Langone Health, New York, NY*

890 **Impact of Treatment of Subclinical Rejection at 2 Weeks After Kidney Transplantation, Compared by 1 Year Histologic Outcomes**
O. Lee[1], K. Lee[1], J. Park[1], J. Lee[2], G. Kwon[3], K. Kim[4], *[1]Surgery, Samsung Medical Center, Seoul, Korea, Republic of, [2]Medicine, Samsung Medical Center, Seoul, Korea, Republic of, [3]Pathology, Samsung Medical Center, Seoul, Korea, Republic of, [4]Biostatistics, Samsung Medical Center, Seoul, Korea, Republic of*

891 **Continuous 24-Hour Antithymocyte Globulin (ATG) for Renal Allograft Rejection: Results of a Randomized Controlled Trial**
S. J. Patel, A. Rogers, S. Kuten, R. Knight, E. Graviss, D. Nguyen, T. Ellimuttil, I. Agboli, L. Gaber, A. Gaber, *Houston Methodist Hospital, Houston, TX*

892 **Dosing Weight of Rabbit Antithymocyte Globulin and Outcomes Among Kidney Transplant Patients Treated for Rejection**
C. Patton, K. Cunningham, C. D'Agostino, A. Novak, M. Kapugi, K. Lang, C. Kane, *Pharmacy, Northwestern Memorial Hospital, Chicago, IL*

893 **Role of Serial Donor Derived Cell-Free DNA Monitoring in Kidney Transplant Recipients**
A. X. Wang, C. R. Lenihan, *Nephrology, Stanford University School of Medicine, Palo Alto, CA*

Kidney: Cardiovascular and Metabolic Complications

894 **Risk of Statin-Related Side Effects in Kidney Transplant Recipients**
S. Bae[1], J. Ahn[1], K. Lentine[2], M. A. Schnitzler[2], G. Hess[3], H. Xiao[2], D. Segev[1], M. McAdams DeMarco[1], *[1]Johns Hopkins University, Baltimore, MD, [2]Saint Louis University, Saint Louis, MO, [3]Drexel University, Philadelphia, PA*

895 **Association of Delayed Graft Function with Mortality Post-kidney Transplantation**
N. Eguchi[1], H. Ichii[2], F. J. Ferrey[1], U. G. Reddy[1], D. C. Dafoe[2], H. Seo[3], K. Kalantar-Zadeh[1], E. Tantisattamo[1], *[1]Division of Nephrology, Hypertension and Kidney Transplantation, Department of Medicine, University of California Irvine, Orange, CA, [2]Division of Kidney and Pancreas Transplantation, Department of Surgery, University of California Irvine, Orange, CA, [3]School of Pharmacy and Pharmaceutical Sciences, University of California Irvine, Irvine, CA*

896 **Superior Metabolic Function of Type 2 Diabetes Mellitus Patients After Simultaneous Kidney/pancreas Transplantation Compared with Kidney Transplantation Alone**
X. Y. Fu, C. Yu, H. Wang, J. Zhao, Z. Wang, C. Mo, X. Shi, G. Feng, W. Song, Z. Shen, *Tianjin First Centeral Hospital, Tianjin, China*

897 **Early Parathyroidectomy for Management of Post-transplant Hyperparathyroidism: A Case Series**
A. Gokhale, J. Chancay, S. Johnson, R. P. Owen, F. Tedla, A. Bhansali, V. Sehgal, R. Shapiro, G. De Boccardo, *Recanati Miller Transplant Institute, Mount Sinai Hospital, New York, NY*

898 **Renal Transplant Recipients with Low Skeletal Muscle Attenuation Have a Greater Risk of Developing New-onset Diabetes After Transplantation**
A. Han, H. Kim, C. Chung, H. Ko, K. Choi, S. Min, S. Min, J. Ha, *Department of Surgery, Seoul National University College of Medicine, Seoul, Korea, Republic of*

899 **An Unexpected Case of Transthyretin Amyloid Cardiomyopathy (ATTR-CM) Overlooked Pretransplant, but Then Diagnosed Early After Kidney Transplant with a Negative Patient Outcome: A Case Report**
W. Hoffman, M. Waybill, H. Yang, D. Ladie, M. Singh, *UPMC Pinnacle Transplant, Harrisburg, PA*

900 **Changes in Body Mass Index Before and After Kidney Transplant**
M. Laub[1], S. Finder[2], P. Harikrishnan[1], M. Simon[3], I. Gani[1], M. Saeed[1], R. Kapoor[1], *[1]Augusta University Medical Center, Augusta, GA, [2]Vanderbilt University Medical Center, Nashville, TN, [3]Brandon Wilde, Augusta, GA*

901 **Predictors of Postoperative Atrial Fibrillation in an Urban, Obese Adult Renal Transplant Population**
A. Lichvar, Z. Ress, M. Tabriz, H. Jenkins, T. Walsh, I. Tzvetanov, E. Benedetti, M. Campara, *University of Illinois at Chicago, Chicago, IL*

902 **The Seattle Heart Failure Model is a Predictor of Mortality After Kidney Transplant in Patients with End Stage Renal Disease and Heart Impairment**
A. Perez-Gutierrez[1], P. J. Bachul[2], D. N. Danz[3], B. Juengel[2], M. Josephson[2], J. Fung[2], P. Witkowski[2], B. Chung[4], Y. Becker[2], *[1]Surgery, University of Chicago, Chicago, IL, IL, [2]Surgery, University of Chicago, Chicago, IL, [3]Economics, University of Pittsburgh, Pittsburgh, IL, [4]Cardiology, University of Chicago, Chicago, IL*

903 **Effect of Insulin versus Oral Agents on Early Glycemic Control Following Kidney Transplant**
A. Petrosan, A. Santeusanio, R. Khaim, V. Delaney, *Mount Sinai Hospital, New York, NY*

904 **Kidney Transplantation in Patients with Severe Pulmonary Hypertension: Not an Absolute Contraindication?**
B. Prajapati[1], D. Gumber[2], I. Moinuddin[1], C. Bhati[1], G. Gupta[1], D. Grinnan[3], D. Kumar[1], *[1]Nephrology, Virginia Commonwealth University, Richmond, VA, [2]Cardiology, Virginia Commonwealth University, Richmond, VA, [3]Pulmonology, Virginia Commonwealth University, Richmond, VA*

906 **Renal Transplant is Safe in Septuagenarians**
P. Serrano Rodriguez, J. Vonderau, K. Szempruch, C. S. Desai, *Abdominal Transplant Surgery, University of North Carolina at Chapel Hill, Chapel Hill, NC*

907 **Early Hypertransaminasemia in Kidney Transplant Recipient: Influence of Donor Type and Clinical Significance**
E. Solà-Porta, M. Redondo-Pachón, S. Núñez-Delgado, C. Arias-Cabrales, M. Mir, A. Buxeda, C. Burballa, M. Crespo, J. Pascual, M. Pérez-Sáez, *Nephrology, Hospital del Mar, Barcelona, Spain*

908 **Sodium Zirconium Cyclosilicate Use in Kidney Transplant Recipients**
K. J. Swanson, F. Aziz, S. Parajuli, M. Mohamed, D. A. Mandelbrot, A. Djamali, N. Garg, *University of Wisconsin-Madison, Madison, WI*

909 **Dietary Intake of Calories and Protein in the Acute Phase Following Kidney Transplant: Opportunities for Improvement**
L. Teigen[1], G. Onyeaghala[1], Y. Doronin[2], B. Guo[1], B. Wu[1], J. Abrahante[1], D. Schladt[1], W. Guan[1], C. Staley[1], M. Al-Kofahi[1], S. Riad[1], A. Matas[1], R. Remmel[1], W. Oetting[1], C. H. Egawa[1], K. Ide[2], T. Ishizuka[3], H. Ohdan[4], Y. Kotera[1], T. Kato[1], A. Ohmori[1], Y. Hirata[1], G. Shibuya[1], S. Yamashita[1], S. Ariizumi[1], *[1]Tokyo Women's Medical University, Tokyo, Japan, [2]Surgery, Hiroshima University, Hiroshima, Japan, [3]Clinical Laboratory, Tokyo Women's Medical University, Tokyo, Japan, [4]Hiroshima University, Hiroshima, Japan*

1097 **Quantifying the Interaction Between Posaconazole and Tacrolimus in Liver Transplant Recipients: A Practical Approach**
B. Lane[1], U. Kaszubski[1], A. Freeman[1], B. Wise[1], L. Hutchinson[1], M. Janusek[1], G. Therapondos[2], H. Bohorquez[3], S. Anders[1], *[1]Pharmacy, Ochsner Medical Center, New Orleans, LA, [2]Hepatology, Ochsner Medical Center, New Orleans, LA, [3]Transplant Surgery, Ochsner Medical Center, New Orleans, LA*

1098 **Highly Sensitized Simultaneous Liver-kidney Transplant Recipients Show a Reduction in Panel Reactive Antibodies and No Kidney Rejection 1-year Post-transplant**
M. Moaddab, J. V. Nolte Fong, C. M. Mobley, A. Saharia, M. J. Hobeika, R. McMillan, S. G. Yi, R. J. Knight, A. Gaber, R. Ghobrial, *Houston Methodist Hospital, Houston, TX*

1099 **Varicella Hepatitis Mimicking Immune Checkpoint Inhibitor-induced Liver Toxicity**
M. J. Weiss[1], X. Zhang[2], E. K. Spengler[1], *[1]Gastroenterology and Hepatology, University of Wisconsin, Madison, WI, [2]Pathology, University of Wisconsin, Madison, WI*

Liver: Kidney Issues in Liver Transplantation

1080 **Development of Novel Multivariable Logistic Regression Model for Predicting Acute Kidney Injury After Liver Transplantation**
H. Chen, Y. Nie, Q. Zhao, X. He, *Organ Transplant Center,, The First Affiliated Hospital, Sun Yat-sen University, Guangzhou, China*

1081 **Non-Alcoholic Fatty Liver Disease in Non-Liver Transplant Patients**

R. Claudio[1], C. Conceicao[2], K. Robichaux[2], A. Kumar[1], J. Buggs[3], N. Kemmer[4], *[1]Morsani College of Medicine, University of South Florida, Tampa, FL, [2]Honors College, University of South Florida, Tampa, FL, [3]Transplant Surgery, Tampa General Hospital, Tampa, FL, [4]Transplant Hepatology, Tampa General Hospital, Tampa, FL*

1082 **A Significantly Shorter Waiting Time to Subsequent Kidney Transplant After Liver Transplant by Using Safety Net Policy**

P. Homkrailas, S. Bunnapradist, *Medicine, David Geffen School of Medicine at UCLA, Los Angeles, CA*

1083 **Perioperative Terlipressin Therapy Reduces the Risk of Acute Kidney Injury Post-Living Donor Liver Transplantation - A Systematic Review and Meta-analysis**

A. V. Kulkarni, H. V. Tevethia, M. Sharma, P. Kumar, N. P. Rao, N. D. Reddy, *Hepatology and Liver Transplantation, Asian Institute of Gastroenterology, Hyderabad, India*

1084 **Comparison of Allograft Outcomes in SLK Transplant Patients with and without ESLD: A UNOS Database Analysis**

P. Kyriazis, H. Patel, P. Nissaisorakarn, F. Cardarelli, N. Agrawal, *Transplant Division, Beth Israel Deaconess Medical Center, Boston, MA*

1085 **The Combined Effects of Simultaneous Portal Vein Thrombosis and Renal Dysfunction in Liver Transplant Recipients**

M. Molinari[1], C. F. Carillo[2], D. Dongling[1], D. Jorgensen[1], S. Dharmayan[1], C. Kaltenmeier[1], H. Liu[1], J. Behari[1], V. Rachakonda[1], S. Ganesh[1], C. Hughes[1], A. Tevar[1], H. Al Harakeh[1], B. Emmanuel[1], A. Humar[1], R. Bataller[1], *[1]University of Pittsburgh Medical Centre, Pittsburgh, PA, [2]Medicine, University of Pittsburgh Medical Centre, Pittsburgh, PA*

1086 **Combined Liver-Kidney Transplantation in Adults With End-Stage Liver Disease: Risk Factors in Patients with Chronic Kidney Disease Stages 3-5, Not on Maintenance Dialysis**

A. Santos, E. Bueno, M. Leghrouz, *University of Florida, Gainesville, FL*

1087 **Obesity is a Risk Factor for Progression to Kidney Transplant Waitlisting After Liver Transplantation**

B. Shelton[1], B. Orandi[1], K. Olthoff[2], E. Pomfret[3], K. Forde[2], D. Sawinski[2], M. Gray[1], N. Ascher[4], J. Locke[1], *[1]University of Alabama at Birmingham, Birmingham, AL, [2]University of Pennsylvania, Philadelphia, PA, [3]University of Colorado School of Medicine, Aurora, CO, [4]University of California San Francisco, San Francisco, CA*

LB 82 **Chances of Renal Recovery in Liver Only Transplant Recipients Who Were Eligible for Simultaneous Liver-Kidney Transplant**

J. Cui[1], A. Spann[2], A. Shingina[2], H. M. Schaefer[3], J. C. Slaughter[4], S. Alexopoulos[5], M. Izzy[2], *[1]Internal Medicine, Vanderbilt University Medical Center, Nashville, TN, [2]Gastroenterology, Hepatology, and Nutrition, Vanderbilt University Medical Center, Nashville, TN, [3]Nephrology, Vanderbilt University Medical Center, Nashville, TN, [4]Biostatistics, Vanderbilt University Medical Center, Nashville, TN, [5]Hepatobiliary Surgery and Liver Transplantation, Vanderbilt University Medical Center, Nashville, TN*

Liver: Large Data and Artificial Intelligence

1181 **Application of Linear Discriminant Analysis (lda) to Differentiate Acute Rejection (ar) and Acute Dysfunction Non-Rejection (adnr) in Liver Transplant Recipients**

M. Miller[1], R. Sinha[1], J. Weems[1], J. Holman[2], M. Altrich[1], S. Kleiboeker[1], J. Levitsky[3], *[1]R&D, Viracor-Eurofins, Lee's Summit, MO, [2]Transplant Genomics, Mansfield, MA, [3]R&D, Northwestern University Feinberg School of Medicine, Chicago, IL*

1182 **Artificial Neural Network Application for MELDNa Prediction**
L. Pruinelli[1], M. Nguyen[1], S. Olson[1], J. Zhou[1], J. Schold[2], T. Pruett[1], S. Ma[1], G. Simon[1], *[1]University of Minnesota, Minneapolis, MN, [2]Cleveland Clinic Foundation, Cleveland, OH*

LB 84 **Deep Learning Based Automatic Liver Volume Estimation and Segmentation via U-net Convolutional Neural Network**
B. Marlatt[1], R. Pettit[2], J. Havelka[1], S. J. Corr[3], A. Rana[2], *[1]InformAI, Houston, TX, [2]Baylor College of Medicine, Houston, TX, [3]Houston Methodist, Houston, TX*

Liver: Living Donor Liver Transplant and Partial Grafts

1126 **Machine Learning Informs Utility-Based Non-Directed Living Liver Donor Allocation**
K. Bambha[1], J. Perkins[1], M. Sturdevant[1], S. W. Biggins[1], R. Bakthavatsalam[1], P. Healey[2], A. Dick[2], J. Reyes[1], *[1]University of Washington, Seattle, WA, [2]Seattle Children's, Seattle, WA*

1127 **Elevated BMI (>28) and High Titer ANA are the Most Common Causes of Abnormal Selective Pre-donation Liver Biopsies in Living Liver Donors**
J. Cisek, *Transplant, University of Colorado Hospital, Aurora, CO*

1128 **Update on Domino Liver Transplants - A Registry Report**
R. Gruessner, J. Renz, A. Gruessner, *SUNY Downstate Medical Center, Brooklyn, NY*

1129 **The Landscape of Non-Directed Living Liver Donation in the United States**
L. R. Herbst, L. Zeiser, A. Massie, K. Herrick Reynolds, E. King, A. Gurakar, D. L. Segev, J. Garonzik Wang, A. M. Cameron, *Johns Hopkins University, Baltimore, MD*

1130 **Outcomes of Robotic Living Donor Right Hepatectomy in Liver Transplant Recipients: A Systematic Review and Meta-analysis**
E. Lincango-Naranjo[1], E. Garces-Delgado[2], P. Solis-Pazmino[3], H. Alexander-Leon[4], G. Restrepo-Rodas[2], R. Mancero-Montalvo[2], C. J. Ponce[2], R. Cadena-Semanate[2], R. Vargas-Cordova[5], G. Herrera-Cevallos[6], A. Villarreal-Juris[7], S. Vallejo[1], C. Liu-Sanchez[8], L. P. Prokop[9], A. D. Guerron[10], O. J. Ponce[1], D. Moris[11], *[1]Knowledge and Evaluation Research Unit, Mayo Clinic, Rochester, MN, [2]Universidad Internacional del Ecuador, Quito, Ecuador, [3]Department of Otolaryngology-Head and Neck Surgery, Stanford University, Stanford, CA, [4]Universidad de las Americas, Quito, Ecuador, [5]Hospital General San Francisco IESS, Quito, Ecuador, [6]Hospital Metropolitano, Quito, Ecuador, [7]Universidad Central del Ecuador, Quito, Ecuador, [8]Universidad Peruana Cayetano Heredia, Lima, Peru, [9]Mayo Clinic Libraries, Mayo Clinic, Rochester, MN, [10]Department of Surgery, Duke University, Durham, NC, [11]Department of surgery, Duke University, Durham, NC*

1131 **Is Low Systemic Fibrinolytic Activity During the Anhepatic Phase Liver Transplant Surgery Associate with the Dreaded Post-Operative Complication of Hepatic Artery Thrombosis?**
H. B. Moore[1], Y. Bababekov[1], J. Pomposelli[1], T. Ferrell[1], F. Azam[1], M. Adams[2], D. Yoeli[1], R. Choudhury[1], M. Wachs[2], E. Pomfret[1], T. Nydam[1], *[1]University of Colorado, Aurora, CO, [2]Childrens Hospital Colorado, Aurora, CO*

1132 **Adult Deceased Donor Liver Transplantation with Split Liver Grafts vs Whole Liver Grafts. A Single-Center Experience**
P. Vargas[1], C. Argo[2], H. Zachary[2], M. Stotts[2], N. Intagliata[2], P. Northup[2], S. Pelletier[1], J. Oberholzer[1], N. Goldaracena[1], *[1]Transplant Surgery, University of Virginia Health System, Charlottesville, VA, [2]Gastroenterology and Hepatology, University of Virginia Health System, Charlottesville, VA*

A. Curtis, C. Pham, B. P. Pierce, *Houston Methodist Hospital, Houston, TX*

1198 **Long-Term Renal Outcomes in Lung Transplant Recipients- A Single-Center Five-Year Experience**
M. Doraiswamy, E. Obole, P. Singh, T. Pesavento, *Comprehensive Transplant Center, The Ohio State University Wexner Medical Center, Columbus, OH*

1199 **A Case-Match Cohort Comparison of the Safety and Efficacy of Basiliximab for Immunosuppression Holiday in Lung Transplant Patients**
M. M. Eiting[1], J. E. Clark[1], T. L. Astor[2], J. Palafox[2], C. Rogers Marks[1], G. Waldman[1], *[1]Pharmacy, Massachusetts General Hospital, Boston, MA, [2]Massachusetts General Hospital, Boston, MA*

1200 **Therapeutic Enoxaparin Dosing in Lung Transplant Recipients**
S. Finder, M. Morrison, K. B. Harrison, S. A. Heeney, *Vanderbilt University Medical Center, Nashville, TN*

1201 **Lung Transplant Outcomes Based on Immunosuppressive Regimen at Discharge: Data from the US Scientific Registry of Transplant Recipients (SRTR)**
W. Fitzsimmons[1], J. Erdman[2], J. Wolfram[3], D. Nimke[2], R. Croy[2], X. Wang[2], T. Weaver[4], D. Schladt[4], *[1]University of Illinois at Chicago, College of Pharmacy, Vernon Hills, IL, [2]Astellas Pharma, Inc, Northbrook, IL, [3]Astellas Pharma Europe BV, Leiden, Netherlands, [4]Chronic Disease Research Group, Minneapolis, MN*

1202 **Textbook Outcome: A Novel Metric in Lung Transplantation Outcomes**
A. M. Ganapathi[1], B. A. Whitson[1], N. A. Mokadam[1], B. C. Keller[2], A. Logan[1], G. Brock[1], K. Washburn[1], A. D. Schenk[1], *[1]Surgery, Ohio State University Wexner Medical Center, Columbus, OH, [2]Medicine, Ohio State University Wexner Medical Center, Columbus, OH*

1204 **Lung Transplantation After Ex-Vivo Lung Perfusion versus Static Cold Storage: A Single Institution Cost Analysis**
S. E. Halpern[1], S. J. Kesseli[2], S. Au[1], M. K. Krischak[1], D. G. Olaso[1], H. Smith[3], G. Tipton[2], I. Jamieson[3], J. C. Haney[2], J. A. Klapper[2], M. G. Hartwig[2], *[1]Duke University School of Medicine, Durham, NC, [2]Surgery, Duke University Medical Center, Durham, NC, [3]Office of Finance, Duke Transplant Center, Durham, NC*

1205 **Pre-Procurement Cardiac Arrest in Lung Allograft Donors and Effects on Recipient Outcomes**
T. J. Hathaway, E. C. Klipsch, D. Roe, C. Hage, M. Duncan, R. S. Mangus, *Indiana University School of Medicine, Indianapolis, IN*

1206 **Incidence and Risk Factors for Nonmelanoma Skin Cancer in Lung Transplant Recipients**
G. Holdren[1], E. Lushin[1], M. Duncan[2], C. Hage[2], *[1]Pharmacy, Indiana University Health, Indianapolis, IN, [2]Pulmonary Critical Care, Indiana University Health, Indianapolis, IN*

1207 **Postoperative Tracheostomy as a Predictor of Poor Clinical Outcomes in Lung Transplantation**
E. C. Klipsch, T. J. Hathaway, D. Roe, C. Hage, M. Duncan, R. S. Mangus, *Indiana University School of Medicine, Indianapolis, IN*

1208 **Mortality from Fulminant Myocarditis in Multi-organ Transplant Recipient with Covid-19**
K. Mahendraraj, I. Kim, T. Todo, T. Brennan, N. Nissen, K. Kosari, G. Voidonikolas, D. Ramzy, *Transplant Surgery, Cedars-Sinai Medical Center, Los Angeles, CA*

1209 **Creating a Lung Transplant Program Search Tool Tailored to Patient Characteristics**
W. T. McKinney[1], C. R. Schaffhausen[1], M. Bruin[2], S. Chu[2], J. Snyder[3], M. Hertz[4], M. Valapour[5], B. Kasiske[6], A. Israni[1], *[1]Hennepin Healthcare Research Institute, Minneapolis, MN, [2]College of Design, University of Minnesota, Minneapolis, MN, [3]Scientific Registry of Transplant Recipients, Minneapolis, MN, [4]Medical School, University of Minnesota, Minneapolis, MN, [5]Pulmonary Medicine, Cleveland Clinic, Cleveland, OH, [6]Nephrology, Hennepin Healthcare, Minneapolis, MN*

1210 **Evaluation of Pepsin in Bronchoalveolar Lavage Fluid Post-lung Transplantation: Implications of Detection**
M. T. Olson, C. Rogers, K. McAnally, A. Arjuna, *Norton Thoracic Institute, St. Joseph's Hospital and Medical Center, Phoenix, AZ*

1211 **A Retrospective Analysis of the Safety and Efficacy of Apixaban After Lung Transplant**
T. Sam[1], K. Reininger[2], R. Patel[1], C. Naik[1], K. Ausloos[1], R. Rosenblatt[1], T. Grazia[1], I. Lam[3], *[1]Transplant, Baylor University Medical Center, Dallas, TX, [2]Transplant, Hennepin County Medical Center, Minneapolis, MN, [3]Transplant, Sharp Memorial Hospital, San Diego, CA*

1212 **Pathology of the Explanted Lungs and Surveillance Allograft Biopsy in 202 Lung Transplant Cases: Single Institution Experience**
S. Sathirareuangchai[1], S. Moore[1], Q. Cai[1], L. De Las Casas[1], J. Joerns[2], J. Torrealba[1], *[1]Pathology, University of Texas Southwestern Medical Center, Dallas, TX, [2]Internal Medicine, University of Texas Southwestern Medical Center, Dallas, TX*

1213 **Evaluation of Fungal Prophylaxis Post-Lung Transplantation**
I. Shah[1], K. Mohrien[1], C. Rose[2], J. Au[1], *[1]Temple University Hospital, Philadelphia, PA, [2]Temple School of Pharmacy, Philadelphia, PA*

1214 **Tacrolimus Dose Requirements in Lung Transplant Recipients on Systemic Azole Antifungals: The Influence of Race and Transplant Indication**
K. S. Walter[1], T. Wert[1], R. Coakley[2], L. J. Lobo[2], R. A. Evans[1], *[1]Department of Pharmacy, University of North Carolina, Chapel Hill, NC, [2]Department of Medicine, University of North Carolina, Chapel Hill, NC*

1215 **Bilateral Lung Transplantation for Destroyed Lungs with Asymmetric Thorax**
B. Yue, J. Chen, *Wuxi People's Hospital Affiliated to Nanjing Medical University, Wuxi, China*

LB 89 **Incidentally Detected Malignancies in Lung Explants: Single Center Case Series**
D. Razia, A. Arjuna, L. Schaheen, J. Huang, M. Smith, R. Bremner, R. Walia, *Thoracic Surgery and Lung Transplantation, Norton Thoracic Institute, St. Joseph's Hospital and Medical Center, Phoenix, AZ*

Pancreas

Pancreas and Islet: All Topics

1216 **Donor-Derived Cell-Free DNA Can Differentiate Rejection versus Other Causes of Pancreas Transplant Dysfunction**
N. Ali[1], J. Miles[2], Z. Stewart Lewis[1], *[1]Transplant Institute, NYU Langone Health, New York, NY, [2]CareDx, Brisbane, CA*

1217 **Induction in Pancreas Transplantation: T-Cell Depletion vs. Il-2 Receptor Blockade**
F. Aziz, S. Parajuli, D. Kaufman, J. Odorico, D. Mandelbrot, *University of Wisconsin, Madison, WI*

1218 **Endocrine Cell Identity and HOMA-B In Patients with Chronic Pancreatitis Undergoing Islet Auto-transplantation**
C. A. Beamish[1], O. Gaber[2], O. M. Sabek[2], *[1]Surgery, Houston Mehodist Hospital, Houston, TX, [2]Surgery, Houston Mehodist, Houston, TX*

1219 **Outcomes of Covid 19 in Candidates Waitlisted for Kidney and Pancreas Transplantation**
R. El-Rifai[1], S. Riad[1], R. Belina[2], A. Matas[2], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Surgery, University of Minnesota, Minneapolis, MN*

1220 **One-Year Monitoring of Changes to Kidney-Pancreas Waiting Time Criteria: An OPTN Analysis**
R. C. Forbes[1], B. Plucinski[2], J. White[2], N. T. Kyaw[2], R. Kandaswamy[3], S. V. Niederhaus[4], *[1]Surgery, Vanderbilt University, Nashville, TN, [2]UNOS, Richmond, VA, [3]Surgery, University of Minnesota, Minneapolis, MN, [4]Surgery, University of Maryland, Baltimore, MD*

1221 **Update on Pancreas Retransplantation-A Registry Analysis**
A. Gruessner, J. Renz, S. Saggi, R. Gruessner, *SUNY Downstate Medical Center, Brooklyn, NY*

1222 **Development of De-novo Malignancies After Kidney and/or Pancreas Transplantation in Diabetic Patients**
A. Gruessner, S. Saggi, J. Renz, R. Gruessner, *SUNY Downstate Medical Center, Brooklyn, NY*

1223 **TPIAT Outcomes in Diabetic and Non-diabetic Patients**
M. A. Kanak, J. B. Spriggs, P. Coughenour, J. Kalivarathan, P. Saravanan, M. Levy, *Virginia Commonwealth University, Richmond, VA*

1224 **Comparative Outcomes of TPIAT in African American and Caucasian Patients with Chronic Pancreatitis**
M. A. Kanak, J. B. Spriggs, P. Coughenour, J. Kalivarathan, P. Saravanan, M. F. Levy, *Virginia Commonwealth University, Richmond, VA*

1225 **Symptoms on MTSOSD Questionnaire in Pancreas Transplantation Recipients**
R. Kaur, S. R. Rizvi, B. H. Smith, C. Reid, S. K. McCrady-Spitzer, W. K. Kremers, P. G. Dean, A. Kukla, M. D. Stegall, Y. C. Kudva, *Mayo Clinic, Rochester, MN*

1226 **Diffuse Calcification Pattern in Chronic Pancreatitis Has Two Aspects in Total Pancreatectomy with Islet Autotransplantation: Bad Sign for Islet Graft Function and Good Sign for Pain Relief**
Y. Liu, K. Kumano, J. Mattke, C. Darden, S. Vasu, M. Lawrence, G. Testa, A. Gupta, E. Beecherl, N. Onaca, B. Naziruddin, *Baylor University Medical Ctr, Dallas, TX*

1227 **Dual-Agent Induction Therapy for Pancreas Transplantation: A Single-center Experience**
E. C. Liu[1], J. H. Lee[1], R. Craig-Schapiro[2], M. Aull[2], S. Sultan[2], *[1]Pharmacy, NewYork-Presbyterian Weill Cornell Medical Center, New York, NY, [2]Kidney/Pancreas Transplant Surgery, NewYork-Presbyterian Weill Cornell Medical Center, New York, NY*

1228 **Impact of Insulin Therapy in Pancreas Transplantation Donors on Graft Outcomes: An Analysis of the Optn/unos Database**

E. Montagud-Marrahi[1], F. Ausania[2], Y. Fundora[2], A. Amor[3], E. Esmatjes[3], J. Ferrer[2], I. Revuelta[1], D. Cucchiari[1], J. Rovira[4], M. Musquera[5], C. Fondevila[2], F. Diekmann[1], P. Ventura-Aguiar[1], *[1]Nephrology and Kidney Transplantation Department, Hospital Clinic de Barcelona, Barcelona, Spain, [2]Hepatobiliopancreatic and Liver Transplant Department, Hospital Clinic de Barcelona, Barcelona, Spain, [3]Endocrinology Department, Hospital Clinic de Barcelona, Barcelona, Spain, [4]Laboratori Experimental de Nefrologia I Trasplantament (LENIT), CRB CELLEX, Fundació Clínic, IDIBAPS, Hospital Clinic de Barcelona, Barcelona, Spain, [5]Urology Department, Hospital Clinic de Barcelona, Barcelona, Spain*

1229 **Human Leukocyte Antigen Mismatches Between Donor-Recipient or Donor-Donor are Not Associated with Adverse Pancreas Outcomes in Pancreas After Kidney Transplant Recipients**

S. Parajuli, D. Kaufman, B. Welch, H. Sollinger, D. Mandelbrot, J. Odorico, *University of Wisconsin, MADISON, WI*

1230 **Early Increases in Post-Transplant Pancreatic Enzymes are Not Associated with Inferior Patient or Graft Outcomes Among Pancreas Transplant Recipients**

S. Parajuli, G. E. Leverson, B. Welch, H. Sollinger, D. Kaufman, D. Mandelbrot, J. Odorico, *University of Wisconsin, Madison, WI*

1231 **Early Increases in Post-Transplant Pancreatic Enzymes Are Associated with Surgical Complications Among Pancreas Transplant Recipients**

S. Parajuli, G. Leverson, B. Welch, H. Sollinger, D. Kaufman, D. Mandelbrot, J. Odorico, *University of Wisconsin, Madison, WI*

1232 **Corticosteroid Reintroduction in Urban Simultaneous Kidney-pancreas Transplant Recipients Following an Early Corticosteroid Withdrawal Protocol**

D. Pierce, P. West-Thielke, M. Campara, I. Tang, M. Spaggiari, I. Tzvetanov, E. Benedetti, A. Lichvar, *University of Illinois at Chicago, Chicago, IL*

1233 **SPK Transplantation in HIV-positive Recipients**

H. Resweber, k. nguyen, H. Curtis, J. Panichella, A. DI Carlo, S. Karhadkar, *Temple University School of Medicine, Philadelphia, PA*

1234 **Donor Derived Cell-Free DNA (dd-cfDNA) in Pancreas Transplant Recipients**

S. Riad[1], H. Sarumi[2], R. Kandaswamy[3], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Surgery, University of Minnesota Physicians, Minneapolis, MN, [3]Surgery, University of Minnesota, Minneapolis, MN*

1235 **Induction Immunosuppression Efficacy in Pancreas and Kidney Transplantation in the SARS-CoV-2 Era**

H. Sarumi, K. Vassar, S. Jackson, T. Pruett, R. Kandaswamy, *University of Minnesota, Minneapolis, MN*

1236 **COVID-19 Presentation and Severity Within One Year of Pancreas and Kidney Transplantation**

H. Sarumi, J. Fisher, B. Johnson, T. Pruett, *University of Minnesota, Minneapolis, MN*

1237 **COVID-19 Transmission within One Year from Pancreas and Kidney Recipients**

H. Sarumi, J. Fisher, B. Johnson, T. Pruett, *University of Minnesota, Minneapolis, MN*

1238 **Systemic Venous versus Portal Venous Drainage in Simultaneous Pancreas-kidney Transplantation: A Matched-pair Analysis**

B. Sharda, *Wake Forest Baptist Medical Center, Winston Salem, NC*

1239 **Achilles Heel No Longer: Marked Decline in Early Relaparotomy and Allograft Pancreatectomy Rates Following Simultaneous Kidney-Pancreas Transplantation in the Contemporary Era**

B. Sharda[1], K. Gurung[2], R. Stratta[2], A. Farney[2], G. Orlando[2], C. Jay[2], A. Reeves-Daniel[3], A. Mena-Gutierrez[3], N. Sakhovskaya[3], W. Doares[4], S. Kaczmorski[4], M. Magid[4], J. Rogers[2], *[1]Wake Forest Baptist Medical Center, Winston Salem, NC, [2]Department of Surgery, Wake Forest Baptist Medical Center, Winston-Salem, NC, [3]Internal Medicine, Wake Forest Baptist Medical Center, Winston-Salem, NC, [4]Department of Pharmacy, Wake Forest Baptist Medical Center, Winston-Salem, NC*

1240 **Outcomes of Simultaneous Kidney-Pancreas Transplantation in Patients with Type-I and Type-II Diabetes Mellitus**

H. Shokouh-Amiri[1], M. S. Naseer[1], A. Palermini[1], D. Aultman[1], R. McMillan[1], S. Tandukar[2], N. Singh[2], G. Zibari[1], *[1]Advanced Surgery, John C. McDonald Regional Transplant Center - Willis Knighton Health System, Shreveport, LA, [2]Transplant Nephrology, John C. McDonald Regional Transplant Center - Willis Knighton Health System, Shreveport, LA*

1241 **Enteric Conversion After Bladder-drained Kidney-pancreas Transplantation**

S. Sivan, M. Ortigosa-Goggins, M. Patel, M. Morsi, L. Chen, J. Figueiro, G. Ciancio, G. Burke, *Miami Transplant Institute, University of Miami Miller School of Medicine, Jackson Memorial Hospital, Miami, FL*

1242 **Distal Allograft Pancreatectomy for Graft Salvage After Pancreas Transplantation**

D. Soma, T. Nikumbh, A. J. Lutz, J. A. Powelson, J. A. Fridell, *Transplant Division, Department of Surgery, Indiana University School of Medicine, Indianapolis, IN*

1243 **Psychosocial Outcomes 1-year Post Total Pancreatectomy and Autologous Islet Cell Transplant**

J. Steel[1], A. Amin[1], M. Wijkstrom[1], A. Zureikat[1], E. Tillman[1], R. Jones[1], D. Yadav[1], A. Slivka[1], A. Phillips[1], M. Bellin[2], A. Carroll[3], A. Humar[1], *[1]University of Pittsburgh, Pittsburgh, PA, [2]University of Minnesota, Minneapolis, MN, [3]University of Pittsburgh Medical Center, Pittsburgh, PA*

1244 **Baseline Levels of Dd-cf Dna After Pancreas Transplantation: Using Dd-cfdna as an Indicator for Pancreas Rejection and Biopsy Avoidance**

A. Yoo, I. Qian, A. Riedel, C. Cazac, A. Bartosic, J. S. Bromberg, J. Scalea, *Department of Surgery, Division of Transplant, University of Maryland School of Medicine, Baltimore, MD*

LB 90 **Donor Derived Cell Free DNA Identifies Rejection in Simultaneous Pancreas Kidney Transplant Recipients**

M. Williams[1], S. Ghosh[2], L. L. Jenkins[2], M. Hertl[1], S. Saltzberg[3], V. Peev[3], E. Chan[1], E. Hollinger[1], E. Schadde[1], O. Olaitan[1], *[1]Department of Surgery, Rush University Medical Center, Chicago, IL, [2]CareDx, Inc., Brisbane, CA, [3]Department of Internal Medicine, Rush University Medical Center, Chicago, IL*

LB 91 **Controlled Donation After Circulatory Death Pancreas Transplantation in Spain. Initial Experience**

J. Ferrer-Fàbrega[1], R. Muñoz[2], J. Ruiz[3], D. Casanova[4], F. Sánchez-Bueno[5], J. Pérez-Daga[6], C. Fernández-Rivera[7], M. Gómez[8], F. Castillo[9], R. López-Andújar[10], J. Maupoey[10], J. Abstract# 1

Donor Derived Transmissions 2019: Analysis of the OPTN Ad Hoc Disease Transmission Advisory Committee (DTAC)

L. Danziger-Isakov[1], M. G. Michaels[1], A. Agarwal[1], S. Aslam[1], K. Dunn[1], J. Goldman[1], D. Levine[1], C. Marboe[1], G. Marklin[1], S. Pouch[1], M. Rana[1], R. Razonable[1], H. L. Stevenson[1], H. S. Te[1], A. Woolley[1], E. Ward[2], C. Jett[2], L. Cartwright[2], R. La Hoz[1], *[1]OPTN DTAC, Richmond, VA, [2]UNOS, Richmond, VA*

Purpose: The OPTN DTAC, a multidisciplinary group, evaluates potential donor derived transmission events (PDDTE), mostly infections (I) & malignancies (M), to assess the likelihood of disease transmission.

Methods: This is a retrospective study of PDDTE cases reported to the OPTN between 01/19 and 12/19. DTAC reviewed cases using a standardized classification algorithm.

Results: During 2019, there were 19,258 donors and 38,425 recipients. DTAC reviewed 311/470 cases reported from donor (160) or recipient (151). 47/311 (15%) donors had proven/probable transmission(P/P Tr) of I, M or other to 73/153 (48%) exposed recipients [figure]. 22 involved living donors. Infection occurred with 35/47 P/P cases affecting 53 recipients. Viruses were most frequent P/P infections with 28 recipients having P/P Tr from 17 donors. HBV & HCV accounted for 40/72 viruses, increased from 28/48 in 2018. For bacteria, 13 recipients had P/P Tr from 10 donors. Parasites (66 reports) resulted in 1 P/P Tr in 2019 compared to 8 donors transmitting to 8 recipients with 2 attributable deaths (AD) in 2018. AD was highest for fungal infections (5/11, 45%). 7 donors with malignancies were classified as P/P impacting 14 recipients with 2 AD. 29 non-I, non-M PDDTE were reported; 5 resulted in P/P Tr to 6 recipients. Deaths from infection (N=6) occurred a median of 47 days (30-113 days), and malignancy deaths (N=2) occurred at 9-368 days.

Conclusions: Although P/P events remain rare, 1/6 reviewed cases resulted in unanticipated P/P Tr, with parasitic decreasing and HCV/HBV increasing in 2019. This is a conservative estimate due to passive reporting and empiric interventions. Infections were most common, led by viruses. Lung recipients continue to be disproportionately represented in 2019. The DTAC continues to evaluate PDDTE to maximize organ use and assess prevention strategies to minimize transmission risk.

	Total Reports	P/P Donor	Total Recipients From P/P Donors	Recipients with Transmission/ Total Recipients From P/P Donors*							Total Recipients with Transmission	Attributable Deaths (%)

Abstract# 2

Combined CD11b/CD40 Blockade is Superior to CD40 Blockade Alone in Prolonging Survival in Pig-to-Nonhuman Primate Renal Xenotransplantation

D. A. Faber[1], B. Lovasik[1], A. Matar[1], C. Breeden[1], S. Kim[1], A. Adams[2], *[1]Surgery, Emory University School of Medicine, Atlanta, GA, [2]Surgery, University of Minnesota, Minneapolis, MN*

Purpose: Blockade of the CD40/CD154 pathway is highly effective in preventing rejection in pig-to-nonhuman primate (NHP) xenotransplantation models. Clinical translation of anti-CD154 mAbs, however, has been plagued by elevated rates of thromboembolic events, and blockade of CD40 alone has not replicated the prolonged xenograft survival of anti-CD154 containing regimens. Recent reports demonstrated that CD11b, a second ligand for CD154, may provide an additional pathway by which rejection signals can bypass CD40 selective blockade, but not CD154 directed therapies. The aim of this study was to assess the efficacy of CD11b blockade in combination with CD40 blockade in preventing rejection in a pig-to-NHP model of renal xenotransplantation.

Methods: Rhesus macaques (n=16) with low pre-transplant xenoreactive antibody titers underwent bilateral nephrectomy and life-sustaining porcine renal xenotransplantation using GGTA1 KO/CD55 transgenic donor pigs. Animals underwent T cell depletion and were assigned to one of three maintenance treatment regimens: anti-CD154 (clone 5C8), anti-CD40 (clone 2C10R4) alone, or combined anti-CD40 plus anti-CD11b (clone M1/70); plus mycophenolic acid and steroids.

Results: Recipients treated with anti-CD154 therapy (n=6) experienced the longest survival (MST=235 days), including three rhesus macaques with extended survival over 300 days (406, 400, 310 days). Recipients treated with combined anti-CD40/CD11b therapy (n=4) showed prolonged survival (MST=101 days) compared with recipients treated with anti-CD40 therapy alone (n=6, MST=6.5 days).

Conclusions: Here we demonstrate that treatment with anti-CD11b mitigates early xenograft rejection seen with anti-CD40 therapy in a porcine-to-NHP model of renal xenotransplantation. Additionally, treatment with anti-CD40/CD11b is statistically similar to treatment with anti-CD154. Together, these data support the hypothesis that CD11b acts as an additional ligand of CD154 through which rejection signals can bypass CD40 selective blockade. These provide further rationale for the continued development and eventual clinical translation of therapeutics to block this pathway.

Abstract# 3

Engineered Human Glomerular Endothelial Cells to Identify Non-hla Antibodies and Decipher Their Pathogenicity After Kidney Transplantation

B. Lamarthée[1], C. Burger[1], C. Leclaire[1], L. Morin[1], F. Terzi[1], C. Tinel[1], D. Anglicheau[2], *[1]Inserm U1151, Necker-Enfants Malades Institute, PARIS, France, [2]Necker Hospital, AP-HP, Department of Nephrology and Kidney Transplantation, PARIS, France*

Purpose: In kidney transplantation recipients (KTRs), donor-specific antibodies directed against Human Leucocyte Antigens (HLA-DSA) are thought to drive antibody-mediated rejection (AMR) and poor transplant outcome. However, evidence of microvascular inflammation, the histological hallmark of AMR, is increasingly reported in patients without HLA-DSA, strongly supporting the implication of non-HLA antibodies (Abs). In KTRs displaying a severe vascular rejection in the absence of HLA-DSA, we previously showed that their pretransplant sera (D0) contain IgG Abs specifically targeting conditionally immortalized human glomerular endothelial cells (CiGEnC).

Methods: As a human cell, the CiGEnC cells constitutively express HLA class I molecules and class II after activation. In order to develop a cell-based assay allowing the detection of non-HLA Abs reactivity to human glomerular endothelial cells even in patients with circulating HLA-DSA, we used the CRISPR-Cas9 technology to delete *B2M* and *CIITA* genes in CiGEnC cells to suppress the expression of class I and II HLA antigens, respectively. Phenotyping of the produced cells was assessed

by flow cytometry, qPCR and confocal microscopy. The produced CiGEnCΔHLA clone was then used as target cell in a new cell-based assay to assess the presence of preformed non-HLA Abs in the sera of a large cohort of 389 consecutive KTRs. **Results:** A two-step process of gene-editing and selection of a CiGEnCΔHLA clone was performed. The engineered CiGEnCΔHLA clone remained undistinguishable from the parent cell line in terms of morphology and expression of various endothelial markers. The CiGEnCΔHLA clone was then used to assess the presence of preformed non-HLA Abs in pretransplant serum samples of 389 consecutive KTRs. Multivariate regression analysis revealed that pretransplant serum reactivity associated to retransplantation status (P<0.001). Addressing the prognosis significance of our cell-based assay, we demonstrated that the pretransplant serum reactivity associated with microvascular inflammation at 3 months and 12 months post-transplantation, independently of HLA-DSAs. In a time-to-event analysis, the pretransplant serum reactivity to CiGEnCΔHLA cells also associated with occurrence of histological lesions suggestive of AMR (i.e. microvascular inflammation >2 or C4d positivity). **Conclusions:** We have developed an engineered human glomerular endothelial cell line lacking HLA antigen that allowed us to identify preformed non-HLA Abs with significant consequences on allograft outcome. These results support the link between the presence of non-HLA Abs and endothelial allograft injury.

Abstract# 4

Myeloid Foxo1-β-catenin Axis Regulates Hedgehog/Gli1 Signaling and Controls NLRP3-Mediated Innate Immune Responses in Sterile Inflammatory Liver Injury

D. Xu, C. Li, M. Sheng, Y. Lin, Y. Tian, Y. Zhan, A. J. Coito, R. W. Busuttil, D. G. Farmer, J. W. Kupiec-Weglinski, B. Ke, *Surgery, Dumont - UCLA Transplant Center, Los Angeles, CA*

Purpose: Foxo1 plays important roles in cell metabolism, oxidative stress, inflammation, and apoptosis. Activation of Hedgehog/Gli1 signaling regulates cell growth, differentiation, and immune function. However, it remains unknown whether and how myeloid Foxo1 signaling may modulate the Hedgehog/Gli1 pathway in sterile inflammatory liver injury. This study investigated the functional roles and molecular mechanisms of myeloid Foxo1 signaling in the modulation of NLRP3-mediated innate immune responses during ischemia/reperfusion (IR)-triggered liver inflammation.

Methods: Myeloid-specific Foxo1 knockout ($Foxo1^{M\text{-}KO}$) and floxed Foxo1 ($Foxo1^{FL/FL}$) mice (n=6/group) were subjected to 90 min partial liver warm ischemia followed by 6 h of reperfusion. In parallel *in vitro* study, bone marrow-derived macrophages (BMMs) were isolated from these conditional knockout mice and transfected with CRISPR/Cas9-mediated Gli1 or Snail knockout vector followed by LPS (100 ng/ml) stimulation.

Results: $Foxo1^{M\text{-}KO}$ mice were resistant to IR-induced hepatocellular damage, with reduced serum ALT levels, macrophage/neutrophil infiltration, and pro-inflammatory mediators compared to the $Foxo1^{FL/FL}$ controls. Unlike in the $Foxo1^{FL/FL}$ controls, $Foxo1^{M\text{-}KO}$ enhanced β-catenin, Hedgehog signaling effector Gli1, and Snail but reduced RIPK3, NEK7/NLRP3 activation in ischemic livers. Disruption of Gli1 in $Foxo1^{M\text{-}KO}$ livers deteriorated liver function with diminished Snail while enhancing RIPK3 and NEK7/NLRP3 activation. For the *in vitro* studies, we found that macrophage Foxo1 and β-catenin co-localized in the nucleus whereby Foxo1 interacts with β-catenin in response to inflammatory stimulation. Importantly, nuclear Foxo1 competed with TCF for interaction with β-catenin. Disruption of the Foxo1-β-catenin axis by Foxo1 deletion enhanced β-catenin/TCF binding, activated Gli1/Snail signaling, leading to inhibited RIPK3 and NEK7/NLRP3. Moreover, macrophage Gli1 or Snail knockout activated RIPK3, which augmented hepatocyte necroptosis after macrophage/hepatocyte co-culture while macrophage RIPK3 knockout diminished NEK7/NLRP3-mediated immune and inflammatory responses.

Conclusions: Myeloid-specific Foxo1 deficiency promotes the Hedgehog/Gli1 signaling and mitigates IR-induced hepatocellular injury through disruption of nuclear Foxo1-β-catenin interaction, which in turn enhances β-catenin/TCF binding and activates the Hedgehog/Gli1/Snail signaling, resulting in reduced NEK7/NLRP3-driven liver inflammation and RIPK3-mediated hepatocyte necroptosis. Our findings underscore the crucial role of myeloid Foxo1 signaling in the modulation of NLRP3-mediated innate immunity and inflammatory responses during sterile inflammatory liver injury, and imply the therapeutic potential in organ IRI and transplant recipients.

Abstract# 5

Twelve Live Births After Uterus Transplantation in the Dallas Uterus Transplant Study

L. Johannesson, G. J. McKenna, A. Wall, J. Bayer, G. Testa, *Baylor University Medical Center, Dallas, TX*

Purpose: To describe aggregated pregnancy outcomes after uterus transplantation from a single, experienced center.

Methods: This prospective study reports on live births among 20 women who received a uterus transplant from 2016 to 2019 at Baylor University Medical Center at Dallas. These live births occurred between November 2017 and September 2020. This study is ongoing. The main measures were live birth, maternal complications, and fetal and newborn outcomes.

Results: There were 6 graft failures (4 surgical complications and 2 with poor perfusion postoperatively). Of the 14 technically successful transplants, at least one live birth occurred in 11 patients. Thus far, the success rate per patient per transplant is 55%, and the live birth rate per patient per technically successful transplant is 79%. Ten uteri were from nondirected living donors and one uterus was from a deceased donor. In vitro fertilization was performed to achieve pregnancy. Ten recipients delivered one neonate and one recipient delivered two neonates. One organ rejection episode was detected during pregnancy and resolved with steroids. The median birthweight was 2890 g (range 1770-3140 g [median 68th percentile]). Maternal weight gain was higher than Institute of Medicine recommendations. Maternal medical complications were observed in five recipients (elevated creatinine, gestational diabetes, gestational hypertension [n=2], and preeclampsia). In five recipients, maternal medical or obstetric complications led to an unplanned preterm delivery (elevated creatinine, preeclampsia; preterm labor [n=3]). The median gestational age at delivery was 36w6d (range 30w6d-38w). All neonates were liveborn, with Apgar scores ≥8 at 5 min.

Conclusions: Thus far, our program experienced a success rate per patient per transplant of 55% and live birth rate per patient per technically successful transplant of 79%. In our experience, uterus transplantation resulted in a third-trimester live birth in all cases where pregnancies reached 20 weeks' gestation. Maternal medical and obstetrical complications can occur; however, these were manageable by applying principles of generally accepted obstetric practice.

Abstract# 6

Immunosuppression in Uterine Transplant Recipients: Experience from the Largest Uterine Transplant Program

N. Wilson, R. Patel, L. Johannesson, G. Testa, T. Sam, *Baylor University Medical Center at Dallas, Dallas, TX*

Purpose: Uterus transplantation (UT) is an emerging treatment in the field of total uterine infertility. There is no consensus on the optimal immunosuppression regimen in UT recipients.

Methods: Of the 20 UT recipients at this center, 6 were excluded due to graft removal prior to 30 days. Ectocervial biopsies (ECB) were collected at pre-determined timepoints to assess for rejection. ECB were scored as: negative, borderline, grade 1, grade 2, or grade 3 for ACR. Rejection was defined as grade 2 or higher. First line treatment for rejection was pulse corticosteroids over 3 days with a total methylprednisolone dose of 2.5g IV.

Results: Duration of immunosuppression at the time of last follow up is 1.5 years (median, IQR 1.2 - 2.1). Nine of the 14 included UT recipients have undergone graft explant post-delivery. Demographics, immunosuppression, and other outcomes are detailed in Table 1. All received induction with rabbit antithymocyte globulin (rATG) 4.5 mg/kg based on ideal body weight (IBW), with the exception of one patient induced with rATG 3 mg/kg who later developed rejection. LCPT-tacrolimus (Envarsus XR) was used in 93% of patients. Four patients discharged on mycophenolate and were converted to azathioprine (AZA, dosed at 1mg/kg daily) prior to pregnancy. One patient received a combination of tacrolimus and everolimus, which was switched to AZA 10 months post-UT. All rejections were subclinical and discovered on protocol ECB. All rejections responded to pulse corticosteroids except one, which required rATG. Only one rejection occurred during pregnancy. No rejections were noted to cause miscarriage or graft failure. Donor specific antibody (DSA) incidence was low and only seen in the rejection group.

Conclusions: In UT recipients, an immunosuppression regimen of rATG 4.5 mg/kg (IBW) paired with dual maintenance therapy TAC (troughs of approx. 5-8 ng/mL) and AZA 1 mg/kg resulted in excellent live birth rates. All rejections were asymptomatic and did not affect patient or graft survival, or live birth rate. Despite

pregnancy being an immunologically sensitizing event, DSA occurrence was infrequent. This study represents a description of IS and rejection treatment of the largest cohort of UT recipients.

Abstract# 7

A Multi-institutional Study of Renal Outcomes in Uterus Transplantation

D. Sawinski[1], L. Johannesson[2], J. Kristen[3], J. Fronek[3], P. Porrett[4], *[1]Hospital of the University of Pennsylvania, Philadelphia, PA, [2]Department of Surgery, Baylor University Medical Center, Dallas, TX, [3]Institute for Clinical and Experimental Medicine, Prague, Czech Republic, [4]University of Alabama at Birmingham, Birmingham, AL*

Purpose: Pregnancy and calcineurin inhibitor-based immunosuppression represent potential renal stressors for uterus transplant (UTx) recipients, many of whom have Mayer-Rokitanksy-Kuster-Hauser (MRKH) syndrome and associated renal abnormalities. Renal dysfunction during pregnancy can contribute significantly to pregnancy complications such as pre-eclampsia (PE) and gestational HTN (gHTN). Nevertheless, studies of renal function in UTx patients are lacking.
Methods: We collected demographic and clinical outcome data on UTx recipients transplanted from 2016-2020 at Prague (n=3), Baylor (n=12) and UPenn (n=2). Only UTx patients who achieved live birth during the study period were analyzed (16/17 patients). Acute kidney injury (AKI) was defined using AKIN criteria. Serum creatinine measurements and glomerular filtration rate (GFR), estimated using the CKD-EPI equation, were compared at different time points using a paired t test; a p value <0.05 was considered significant.
Results: The average age at UTx was 28.9 ±4.3 yrs and the most common reason for transplantation was MRKH in 93.4%; only one patient had a solitary kidney. A second pregnancy occurred in 2 women but these data were not included in this analysis. Pretransplant renal function was normal for all UTx recipients (mean serum creatinine 0.75mg/dL± 0.1; mean eGFR 107ml/min±13). An increase in serum creatinine >=0.3mg/dL was noted in 37.5% after UTx; likewise, mean serum creatinine at embryo transfer was significantly higher than pretransplant (0.84mg/dL±0.2, p=0.035). Four patients (25%) developed AKI Stage I in the third trimester. 50% developed a hypertensive disease of pregnancy and 4 (25%) developed PE. GFR at embryo transfer was numerically lower in women who developed PE (82ml/m±27 vs. 102ml/m±17; p=0.11) and this difference was significant at 16 weeks' gestation (72ml/m±25 vs. 106m/m±21, p=0.02). Complicated pregnancies were associated with a shorter gestational duration. GFR improved for all patients after hysterectomy and cessation of immunosuppression but did not always return to pretransplant levels postpartum (Figure1).
Conclusions: AKI is common among UTx recipients and is associated with pregnancy complications. Studies of kidney function in this population are needed to both improve risk counseling for UTx candidates and guide patient selection.

Abstract# 8

Stem Cell and Novel Neurotrophic Factors to Promote Functional Outcomes in Limb Transplantation

S. K. Salgar[1], J. Weiss[2], C. Phillips[2], E. Malin[2], V. Gorantla[3], J. Harding[4], *[1]Clinical Investigation, United States Army, Tacoma, WA, [2]Clinical Investigation, Madigan Army Medical Center, Tacoma, WA, [3]Surgery, Wake Forest University, Winston-Salem, NC, [4]Neuroscience, Washington State Universisty, Pullman, WA*

Purpose: Recently, transplantation of hand and face has become a new clinical specialty. The objective of this study was to determine whether adult Mesenchymal Stem Cells (MSCs), Granulocyte-Colony Stimulating Factor (G-CSF) and/or Dihexa can promote limb transplant function.
Methods: We used rat sciatic nerve transection-repair model. There were 10 experimental groups (n=6/group). Bone marrow derived syngeneic MSCs (2 million), G-CSF (50-100µg/kg), (Dihexa 2-4mg/kg) and/or Vehicle were administered locally via hydrogel at the site of nerve repair, i.v./i.p., and to gastrocnemius muscle.
Results: Total sensory function was ~1.4, 1.7, 2.7 and 2.9 at 2, 4, 8 and 16 weeks post-nerve repair, respectively, on a scale of Grade 0-3 (0=No function; 3= Normal function) in all groups combined; peroneal nerve function recovered quickly by one week (~2.0) and sural nerve function recovered slowly by four weeks (~1.0). Motor function at 16 weeks post-nerve repair as determined by walking foot print grades 0-4 (0=no print; 4=heel plus 4-5 toe prints) was 3.0±0.9, 3.0±0.8, and 2.0±0.6 in MSC+G-CSF, MSC+Dihexa and MSC+vehicle groups with gastrocnemius injections, respectively; however, without gastrocnemius injection it was ~1.6. G-CSF or Dihexa injections to gastrocnemius significantly ($P<0.05$) improved motor function, mitigated muscle atrophy and reduced flexion contractures. MSCs expanded ex vivo were CD29+, CD90+, CD34-, CD31-, MHC Class I+, Class II- and multipotent. In a parallel study with tibial nerve repair we observed significant nerve regeneration/myelination with MSC therapy (n≥6).
Conclusions: It appears, MSC, G-CSF and Dihexa are promising candidates for adjunct therapies to promote limb transplant function.

Abstract# 9

Recovery After Extended Static Cold Storage Preservation Using Subnormothermic Machine Perfusion in VCA

M. Goutard[1], R. J. de Vries[1], A. G. Lellouch[1], E. Lupon[1], C. Pendexter[1], S. N. Tessier[1], M. A. Randolph[1], L. Lantieri[2], C. L. Cetrulo[1], K. Uygun[1], *[1]Massachusetts General Hospital, Harvard Medical School, Shriners Hospitals for Children, Boston, MA, [2]Hôpital Européen Georges Pompidou, Paris, France*

Purpose: Vascularized composite allografts (VCA) are more sensitive to cold ischemia than solid organ transplants due to the remaining metabolism in skeletal

muscle cells. In our VCA preservation studies, we observed a higher risk of epidermolysis and muscle fibrosis after extended periods of cold ischemia in a rodent transplantation model. We hypothesized that our perfusion protocol would recover the limbs before transplant and improve the clinical outcomes.

Methods: Partial hind limbs in Lewis rats were procured and flushed with 2ml of heparin saline (100UI/ml) at room temperature then perfused with 150ml of modified Steen solution (Steen+) for 3hours (control group, n=5). In the study groups, grafts were also flushed with 5ml of ice cold HTK solution, then immersed in HTK in a sterile bag and stored in static cold storage (SCS) at 4°C for a period of 6, 12 or 18hours before the 3hrs recovery SNMP (n=4 in each group). Perfusion parameters (vascular resistances, glucose and oxygen consumption, lactates and potassium release) were assessed q30min. Biopsies were taken for histological and ATP analysis and weight gain was measured at the end of perfusion.

Results: In all SCS groups, we were able to restore a flowrate of 0.8ml/min at the end of perfusion. Arterial resistances spiked at 30min in the 6 and 12hrs SCS groups and at 60min in the 18hrs SCS group. In each group, a constant decrease in resistance was seen after the spike and final resistances were similar to the control. After 3hrs SNMP, potassium release was significantly higher in the 12 (p=0.003) and 18hrs SCS group(p=0.0002); however, it remained in an acceptable range (<6.5mmol/L). Lactate production was not statistically different at the end of perfusion in all groups. Nonetheless, weight gain was significantly higher in the 18hrs SCS group compared to the other SCS groups. **(Fig. 1)**

Conclusions: We describe a successful perfusion recovery protocol for cold ischemic VCA in a rodent model. In all groups, perfusion parameters improved throughout the experiment to reach the same level as in our control group. Our SNMP protocol with Steen+ is encouraging for VCA perfusion recovery after extended cold ischemia damage. Our results will be confirmed in vivo by transplantation in rodents.

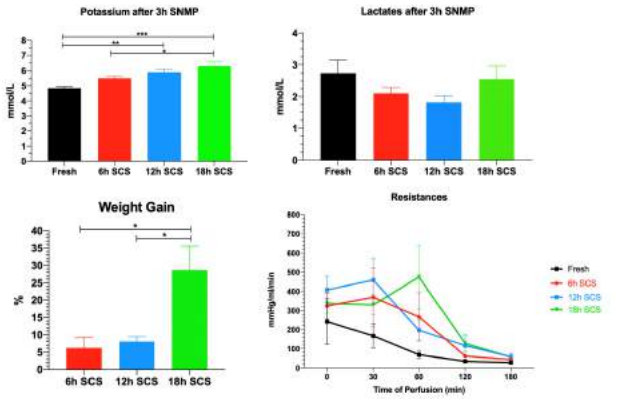

Figure 1. Perfusion parameters

Abstract# 10

A Noninvasive Diagnostic Approach for Molecular Monitoring of Face Transplant Recipients

C. Snopkowski[1], P. Rabbani[2], H. Yang[1], Z. Berman[2], G. Diep[2], C. Li[1], T. Muthukumar[1], R. Ding[1], D. Ceradini[2], M. Suthanthiran[1], *[1]Weill Cornell Medical Institute, Department of Medicine, Division of Nephrology, NY, NY, [2]NYU Langone Health, Hansjörg Wyss Department of Plastic Surgery, NY, NY*

Purpose: Skin biopsies are currently the gold standard for evaluating the inflammatory status of face allografts. However, "tape stripping" is emerging as a noninvasive technique to monitor autoimmune/auto inflammatory skin diseases. This technique, highly suitable for serial sampling and combined with high sensitive PCR assays, could revolutionize molecular monitoring the face allograft status. Herein, we tested the hypothesis that isolation of total RNA and gene expression profiling are feasible using skin samples collected using tape strips.

Methods: Tape strips (CuDerm Corporation, Texas) were used to obtain RNA from two face transplant recipients. Each tape strip is comprised of 10 discs. Allograft skin area was marked, cleaned with alcohol, and 8 samples (8 tape strips) were obtained. Each disc (10 discs from one sample) was immersed in 1ml RLT buffer with 100ul β-mercaptoethanol. RNA was isolated from the tape strip skin samples using the RNeasy mini kit. We quantified total RNA using A260/A280 ratio, reverse transcribed RNA into cDNA and pre-amplified cDNA using oligonucleotide primer pairs for a custom panel of mRNAs. We measured absolute levels of mRNA for Keratin 15, MIP1α, and MIP1β, as well as 18S rRNA by preamplification enhanced real time quantitative PCR assays (RT-qPCR assays) using Quant Studio 6. We designed gene specific Taqman primers and probes to amplify and detect gene of interest and a customized BAK amplicon to develop a standard curve for absolute quantification of transcript copies per microgram of total RNA.

Results: Median quantity of total RNA from the tape strips was 64.48ng. Individual and the median number of total RNA, individual and the median number of the reference gene 18S rRNA, and individual and median number of mRNA copies of Keratin 15, MIP1α, and MIP1β are shown in Figure 1.

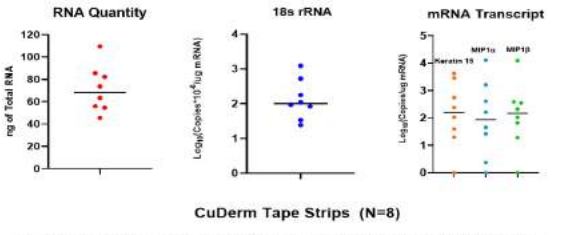

Figure 1. Each colored dot represents a tape strip from an allograft skin. Each tape strip consists of 10 discs. For a given sample, each of the 10 discs were immediately immersed in 1ml of buffer RLT with β-mercaptoethanol (10mL per sample). Total of 8 tape strips obtained from two face transplant recipients were used for RNA isolation.

Conclusions: We have demonstrated the feasibility of isolating total RNA from tape strips and quantifying transcript abundance. Further refinement of this technology is ongoing in our laboratory. Tape strip based molecular monitoring of face transplant recipients may offer a noninvasive substitute for allograft biopsies.

Basic

Biomarkers, Immune Assessment and Clinical Outcomes - I

Abstract# 11

A Single Nucleotide Polymorphism within the FCGR3A 158 F/V Gene is Associated with Decreased Survival of Renal Allografts with Chronic Active Antibody-Mediated Rejection

N. H. Litjens, A. M. Peeters, J. A. Kal-van Gestel, M. Klepper, M. G. Betjes, *Internal Medicine, Nephrology and Transplantation, Erasmus MC, University Medical Center, Rotterdam, Netherlands*

Purpose: Long-term allograft survival has shown little improvement over the last decades. An important factor compromising long-term allograft survival in kidney transplantation is chronic active antibody mediated rejection (c-aABMR). Histomorphologic lesions of c-aABMR develop over time and are associated with recurrent and episodic endothelial cell activation by immunoglobulin G (IgG)-antibodies recognizing donor-specific leukocyte antigens (HLA) (DSA) or non-HLA antigens. Immune cells expressing Fc-receptors (FCGRs) interact with IgG antibodies bound to endothelial cells and genetic variation in *FCGR* genes may affect susceptibility for antibody-mediated rejection. Natural killer (NK) cells express the Fc-receptor CD16 (*FCGR3A*) and could therefore mediate renal endothelial cell damage in cases of c-aABMR. The V/V-genotype of the *FCGR3A* 158 F/V single nucleotide polymorphism is associated with increased CD16 expression and cytotoxicity by NK cells. This study evaluated whether this genotype is associated with the diagnosis of c-aABMR and renal allograft loss.

Methods: Cases of c-aABMR (N=133) and control kidney transplant recipients without c-aABMR (N=116) were genotyped for *FCGR3A* 158 F/V. In addition, CD16 expression by NK cells and CD16-dependent NK-cell function were evaluated. Follow-up of cases of c-aABMR was until 1st of January 2020 and graft loss/failure was defined as the need for dialysis or a retransplantation. The date of diagnosis of c-aABMR and date of graft failure were used to calculate graft survival upon diagnosis.

Results: The distribution of the *FGCR3A* 158 F/V-genotypes was not different for c-aABMR cases compared to control kidney transplant recipients (P-value =0.65). The V-allele was associated with increased median fluorescence intensity (MFI) of CD16 by NK cells (MFI $3.5x10^4$ versus $1.3x10^4$ for V/V and F/F-genotype, P<0.001). Increased expression of CD16 correlated with CD16-dependent degranulation of NK cells (R=0.4; P=0.02). Moreover, the V/V-genotype was significantly associated with a higher glomerulitis score and an independent risk factor (HR 1.98; P=0.04)

for decreased allograft survival. Death-censored graft survival in c-aABMR cases at 3 years follow-up was 33% for the *FCGR3A* 158 V/V-genotype versus 62% for the F/F-genotype.
Conclusions: In conclusion, the *FCGR3A* V/V-genotype increases CD16-mediated NK cell cytotoxicity and is associated with a higher glomerulitis score and decreased renal allograft survival in cases with c-aABMR.

Abstract# 12

T-cell-Mediated Immunity to Sars-cov-2 Defines Covid-19 Risk and Severity in Transplanted and Non-Transplanted Individuals and Associates with Myeloid-Derived Suppressor Cells

C. Ashokkumar[1], V. Rohan[2], A. H. Kroemer[3], S. Rao[4], G. Mazariegos[5], B. W. Higgs[5], S. Nadig[2], M. Ningappa[5], T. Fishbein[3], S. Subramaniam[6], R. Sindhi[7], *[1]Plexision, Pittsburgh, PA, [2]Medical University of South Carolina, Charleston, SC, [3]MedStar Georgetown Transplant Institute, Georgetown, DC, [4]DHR Health Institute for Research and Development, Texas, TX, [5]University of Pittsburgh, Pittsburgh, PA, [6]University of California, San Diego, CA, [7]University of Pittsburgh, pittsburgh, PA*
Purpose: We assessed whether COVID-19-risk is enhanced by chronic immunosuppression, and is associated with suppressor cells.
Methods: We tested 66 COVID-19 patients, including 26 with solid organ transplants at median 11 days after diagnosis, and 64 unexposed healthy subjects including 21 with transplants, who were sampled pre-pandemic. T- and B-cells, which express CD154 were measured after stimulation with peptide mixtures representing the spike protein S, its conserved C-terminal S2, and less conserved N-terminal S1 components. Monocytic myeloid-derived suppressor cells (M-MDSC) were measured in an independent cohort of 47 COVID-19 patients
Results: Frequencies (%) of S-reactive T-cells (Mean±SEM 2.0±0.3 vs 3.8±0.3, p=5.6E-05) and B-cells (3.0±0.4 vs 5.1±0.4, p=0.0003) were significantly lower in COVID-19 compared with healthy subjects, but were measurable in all samples. Transplanted and non-transplanted subjects demonstrated similar within group frequencies of S-reactive T-cells (4.1±0.3 vs 3.7±0.5, p=NS in healthy and 1.5±0.4 vs 2.4±0.3, p=NS in the COVID-19 group) and other S-reactive cells. Among COVID-19 patients, intubated patients showed lower S-reactive CD8 frequencies compared with non-intubated patients. (1.4±0.5 vs 3.5±0.5, p=0.003). In logistic regression analysis using training and test sets, S-reactive CD3 and CD8 cells, age, race, and transplantation status distinguished COVID-19 from healthy subjects (test set negative and positive predictive values 75% and 85% respectively, AUC 0.9). Among 66 COVID-19 patients, S-reactive CD8 cells and age predicted respiratory failure with NPV 62%, PPV 86%, AUC 0.73. S2-reactive T-cells demonstrated similar predictive performance. S1 antigen elicited minimal cellular responses. Transplanted COVID-19 patients show lower cytomegalovirus-specific CD154+CD3 frequencies compared with non-transplanted patients (0.5±0.1 vs 1.3±0.2, p=0.006). Frequencies of CD14+CD33+CD11b+HLADR-ve M-MDSC (14.5±2.9 vs 3.3±1.5, p=0.002) were higher in 47 independent COVID-19 patients compared with 6 healthy subjects.
Conclusions: Conserved SARS-CoV-2-spike antigen drives T-cell immunity to COVID-19 in unexposed transplanted and non-transplanted subjects. This immunity declines with COVID-19 infection, is accompanied by increased myeloid derived suppressor cells, and can predict infection-risk and disease severity. Transplant patients demonstrate increased COVID-19-risk and co-infection-risk.

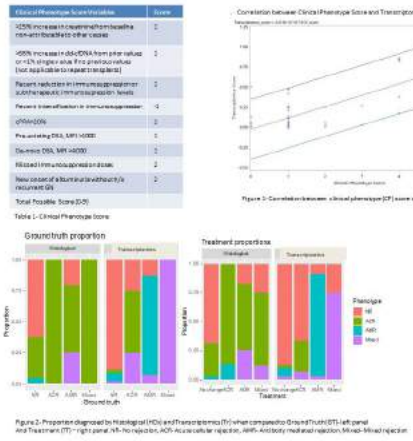
Abstract# 13

Precision Medicine Tools in Kidney Transplant (KTx): Implications for Individualized Immunosupression Therapy and Downstream Cost-savings

S. Anand, J. Sanchez-Garcia, L. Dong, M. Fife, J. Krong, D. Morris, T. Srinivas, *Intermountain Medical Center, Murray, UT*
Purpose: Kidney Tissue Transcriptomics (Tr) is an emerging adjunct to traditional histology for diagnosis of kidney rejection in KTx. The objective assessment and reliance on Tr offers a vital, reliable tool for diagnosing early antibody mediated rejection (AMR) and confirming or refuting a borderline T- cell mediated rejection (TCMR) where subjectivity might alter decision making. We devised a clinical phenotype (CP) score and tested its correlation with Tr. We hypothesized 1) Tr results would match clinical phenotyping (CP) and be closer to the "ground truth" (GT) than traditional histological diagnosis (HDx); 2) treatment decision based on Tr would generate personalized targeted immunosuppression and potential cost-savings.
Methods: Patients who underwent kidney biopsy for cause from July 2016 to Nov 2020 were included in the study. We incorporated Tr in the routine workflow for cause biopsies for KTx. CP scores utilized a scoring system for development of rejection clinical phenotype (Table 1). CP scores were assigned on retrospective chart review, with the observer blinded to pathology results. GT was the diagnosis that the clinician used to treat the patient which was considered gold standard. Treatment (TT) was treatment given to the patient. These were retrieved from retrospective chart review.
Results: Of the 69 patients, the median score for CP was 1 (IQR 1-3). CP scores showed a significant, linear and positive correlation with Tr rejection scores (Fig 1). Tr and HDx both showed discordance with comparative standards- GT and TT(Fig 2). Overall, discordance of HDx was higher than Tr for both comparative standards- GT and TT. HDx disproportionately misdiagnosed more borderline acute cellular rejection (ACR) where no rejection (NR) based on GT and TT. Tr successfully diagnosed more acute antibody mediated rejection (AMR) consistent with GT and TT, while HDx missed AMR when compared to the standard GT and TT.



Conclusions: Incorporating Tr pathophysiological based transcripts led to personalization and optimization of immunosuppression (IS) dose and type. Tr resulted in avoidance of overtreatment for ACR, while led to early therapeutic interventions for AMR to dampen early antibody response. Both treatment decisions have potential for cost savings and better patient outcomes, and improved allograft survival. CP scores at bedside are correlated with Tr scores, which can help triage, personalize IS dose and type while awaiting Tr results. Further studies need to validate the utility of CP score.

Abstract# 14

Characterisation of Distinct Graft Infiltrates Following Cellular Therapy in Kidney Transplant Recipients

M. O. Brook[1], P. N. Harden[2], I. Roberts[2], W. R. Mulley[3], J. Hester[1], M. E. Reinders[4], F. Issa[1], *[1]Nuffield Department of Surgical Sciences, University of Oxford, Oxford, United Kingdom, [2]Oxford University Hospitals NHS Foundation Trust, Oxford, United Kingdom, [3]Department of Nephrology, Monash Medical Centre, Melbourne, Australia, [4]Division of Nephrology and Transplant Center, Leiden University Medical Center, Leiden, Netherlands*
Purpose: Cellular therapy is an emerging treatment in the field of clinical transplantation with the potential to improve both short and long-term transplant outcomes. We are taking the first steps towards assessing the potential of cell therapies in the clinical setting of living donor kidney transplantation. A critical aspect of these studies is generating an understanding of how infused cell therapies might impact on the recipient immune response to alloantigen and mediate any beneficial effect.
Methods: Patients receiving regulatory T cell infusion as part of a phase 1 clinical trial underwent a protocol biopsy at 8 months post-transplant. Biopsies are compared with those from patients with an acute T cell mediated rejection episode and surveillance biopsies from patients with clinically stable graft function. Initial

analysis was performed using routine immunohistochemistry. Subsequently, a NanoString GeoMX digital spatial profiler was used to interrogate the composition of biopsy infiltrates through protein and mRNA expression in a tissue location specific manner (Figure 1).

Results: Routine histology demonstrated the presence of unique cellular infiltrates that were dense and remarkably focal in nature in all patients treated with cell therapy. Immunohistochemistry revealed between 5 and 10% of such infiltrates are positive for FOXP3, a marker of regulatory T cells, but one that is also expressed on activated human effector T cells. Digital spacial profiling revealed that infiltrates in all three clinical scenarios demonstrate unique properties based on protein and mRNA expression data and represent distinct cell populations. Infiltrates in the setting of cellular therapy have an expression profile suggestive of regulatory activity.

Conclusions: We demonstrate the prescence of dense focal cellular infiltrates in renal transplant biopsies from patients treated with cell therapy. Such infiltrates are interogated using novel spatial profiling techniques and found to be distinct from those seen during a rejection episode and from infiltrates noted on surveillance biopsies.

Abstract# 15

Integrative Analyses of Circulating Small Rnas and Paired Kidney Graft Transcriptome in Transplant Glomerulopathy

C. Kuscu[1], K. Manjari[2], M. Akram[3], C. Kuscu[4], A. Wolen,[4], A. Bajwa[4], J. Eason[4], D. G. Maluf[5], V. Mas[6], E. Akalin[7], *[1]Surgery, James D Eason Transplant Institute, UTHSC, Memphis, TN, [2]Department of Systems and Computational Biology, School of Life Sciences, University of Hyderabad,, Hyderabad,, India, [3]Center for Biomedical Informatics, University of Tennessee Health Science Center, Memphis, TN, [4]Surgery, James D Eason Transplant Institute, Memphis, TN, [5]Surgery, Program in Transplantation, University of Maryland, Baltimore, MD, [6]Surgery, Division Surgical Science, University of Maryland, Baltimore, MD, [7]Medicine, Montefiore Medical Center, Abdominal Transplant Program, Albert Einstein College of Medicine,, NYC, NY*

Purpose: Transplant glomerulopathy (TG) develops through multiple mechanisms including donor-specific antibodies, T cells and innate immunity. We investigate the role of circulating small RNAs (sRNAs) in TG comparing intragraft gene expression profiles.

Methods: sRNAs profiles were evaluated in serum of kidney transplant recipients with biopsy-proven TG and normal allograft function using RNA sequencing. An integrative approach was applied to link miRNA changes in serum with gene expression profiles from the paired allograft samples.

Results: Among total sRNA population, miRNAs were the most abundant species, compromising approximately 30% of total sRNAs in the serum of kidney transplant patients (Fig. A). Fragments arising from mature tRNA and rRNA were also detected. Most of tRNA fragments (tRFs) were generated from 5' ends of mature tRNA and mainly from two parental tRNAs: tRNA-Gly and tRNA-Glu (Fig. B). Paired gene expression analysis from allograft tissues showed changes in canonical pathways related to immune activation such as iCos-iCosL signaling pathway in T helper cells, Th1 and Th2 activation pathway, and dendritic cell maturation (Fig. C, D). mRNA targets of down regulated miRNAs such as miR-1224-5p, miR-4508, miR-320, miR-378a from serum were globally upregulated in tissue.

Conclusions: This is the first study to report the circulating sRNA profiles in transplant patients with TG using next generation sequencing. A novel circulating tRNA fragment TG signature is reported. Integration of sRNA profiles from serum with gene expression from tissues showed that changes in serum miRNAs support the role of T-cell mediated mechanisms in ongoing allograft injury.

Abstract# 16

Utility of Follow-up Biopsies After Acute Rejection in Pediatric Kidney Transplantation

S. S. Raza[1], V. Hauptfeld-Dolejsek[1], F. Rosenblum[1], E. C. Mroczek-Musulman[2], D. R. Kelly[2], M. Seifert[1], *[1]Department of Nephrology, UAB School of Medicine, Birmingham, AL, [2]Children's of Alabama, Birmingham, AL*

Purpose: Treatment of acute kidney transplant rejection in children is often guided by creatinine-based estimates of GFR (eGFR) that may lack sensitivity to determine the adequacy of therapy. The purpose of this study was to analyze our center's practice of performing follow-up biopsies to assess for resolution of acute rejection.

Methods: We performed a retrospective cohort study of all biopsy-proven subclinical and clinical T cell-mediated acute rejection (TCMR) episodes at our center between January 2009 and December 2014. We analyzed the first subclinical or clinical TCMR episode in each patient that had at least one follow-up biopsy performed within three months of diagnosis. Treatment of rejection included standard courses of intravenous pulse steroids with a 4-6-week oral taper with the addition of anti-thymocyte globulin in severe or steroid-resistant rejection. The primary endpoint was biopsy-proven resolution of TCMR, defined by follow-up Banff injury scores of < i1t1 and v=0. The secondary endpoint was a composite outcome of acute rejection, graft loss, or death by five years. We compared continuous and categorical variables between subgroups with resolved versus persistent TCMR using standard approaches. We used Kaplan-Meier methods to compare time-to-event data between those with resolved versus persistent TCMR.

Results: We identified 27 pediatric kidney transplant recipients with at least one follow-up biopsy within three months of diagnosis of subclinical (n=9) or clinical (n=18) TCMR. The cohort was 44% black race, 48% female sex, and 85% deceased donor recipients. Overall, 17/27 (63%) of children had eventual resolution of TCMR on serial follow-up biopsies. However, only 10/27 (37%) had resolution of TCMR on the initial follow-up biopsy within 4-6 weeks of standard treatment. We found no clinical or demographic characteristics that were associated with the response to treatment, including the type of rejection (subclinical/clinical) or improvement in eGFR. The persistent TCMR group had a trend for a higher incidence of the composite endpoint (50% versus 24%; P=0.06, Figure).

Conclusions: Serial follow-up biopsies frequently detected unresolved subclinical and clinical TCMR that may be associated with inferior long-term outcomes in pediatric kidney recipients. Larger studies are warranted to compare biopsy-guided to eGFR-guided treatment regimens for TCMR in children.

Abstract# 17

The Gut Microbiome in Heart Transplantation: A Prospective Pilot Study

M. Dela Cruz[1], E. Littmann[2], R. Nayak[2], C. Lehmann[2], R. Keskey[3], T. Baker[3], H. Lin[2], A. Bennett[1], G. Kim[1], S. Pinney[1], E. Pamer[2], A. B. Nguyen[1], *[1]Cardiology, University of Chicago, Chicago, IL, [2]Medicine, University of Chicago, Chicago, IL, [3]Surgery, University of Chicago, Chicago, IL*

Purpose: The contribution of the intestinal microbiome to alloimmunity in heart transplantation (HT) is unknown. We examined the fecal microbiota of HT recipients at the time of transplantation and characterized microbiota composition, diversity, and metabolite production.

Methods: In a prospective, observational, pilot study, pre and post-HT stool samples were collected and microbiota composition determined by 16S ribosomal RNA gene sequencing. Fecal short chain fatty acid (SCFA) concentrations were determined using targeted metabolomics. HT samples were compared to those from healthy controls (HC), liver transplant (LT), and ICU patients.

Results: Fecal samples were analyzed from 15 HT recipients (including 2 heart-kidney, 1 heart-liver, 1 heart-liver-kidney) and compared to 15 HC, 16 LT, and 61 ICU patients. Within sample microbial diversity, quantified by inverse Simpson index, was lower in HT subjects compared to HC ($p<0.002$), but higher than that of ICU ($p<0.003$) and LT ($p<0.001$) (Fig.1A). HT microbiota had lower frequencies of Ruminococcaceae than HC (11.3% vs 24%, $p<0.001$), while ICU and LT had marked losses of obligate anaerobes and higher predominance of *Enterococcus*, *Lactobacillus*, and *Proteobacteria*. Compared to ICU and LT, HT microbiota had significantly higher abundances of the commensal anaerobic bacterial families *Lachnospiraceae* (HT 26.9% vs ICU 12.2% vs LT 4.8%, $p<0.001$) and *Ruminococcaceae* (HT 11.3% vs ICU 6.9% vs LT 1.2%, $p<0.001$), and higher butyrate concentrations (HT 7.06mM vs ICU 3.34mM vs LT 1.15mM, $p<0.001$) (Fig.1B). Among HT and ICU subjects, the presence of *Lachnospiraceae* strongly correlated with concentrations of the SCFAs acetate ($r = 0.62$, $p<0.001$), butyrate ($r = 0.50$, $p<0.003$), and propionate ($r = 0.59$, $p<0.001$). Similar correlations were seen with *Ruminococcaceae.* Analysis of beta diversity with Bray-Curtis and Unifrac PCoA demonstrated a trend towards clustering by cohort.

Conclusions: The microbiota of HT recipients is less diverse than that of HC but is remarkably more diverse and contains a greater representation of commensal bacteria than that of LT or ICU subjects. SCFA concentrations differed significantly between cohorts and correlated with the presence of specific bacterial groups. Intriguing differences in microbiota composition and SCFA production are measurably identifiable between and within groups. Further recruitment, collection, and correlation to clinical outcomes is in progress.

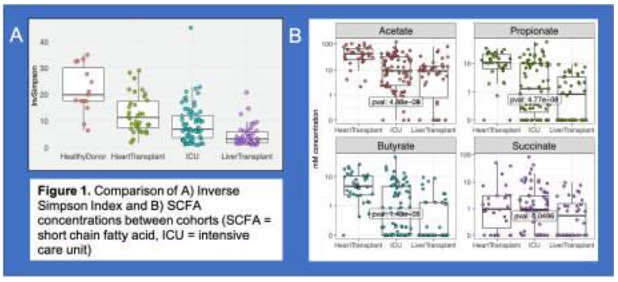

Figure 1. Comparison of A) Inverse Simpson Index and B) SCFA concentrations between cohorts (SCFA = short chain fatty acid, ICU = intensive care unit)

Abstract# 18

Peripheral Blood Hematopoietic Chimerism: A Robust Biomarker for Transplantation Tolerance

D. Tollerud[1], E. Gornstein[1], J. Leventhal[2], K. V. Ravindra[3], S. Ildstad[1], *[1]Talaris Therapeutics, Louisville, KY, [2]Division of Organ Transplantation, Northwestern Medical Group, Chicago, IL, [3]Department of Surgery, Duke University Medical Center, Durham, NC*

Purpose: Despite the development of highly effective immunosuppressive medications, organ rejection and the toxicity of the drugs themselves remain significant obstacles to long-term graft and patient survival. It has been known for over 5 decades that peripheral blood chimerism was associated with immunological tolerance to a transplanted organ, beginning with the observations by Owen followed by the seminal investigations by Billingham, Brent and Medawar that ultimately earned them a Nobel Prize. A major limitation to tolerance induction approaches has been the lack of a robust and reliable biomarker that would allow the safe withdrawal of immunosuppression without a high risk of organ rejection.

Methods: Work by Ildstad and colleagues led to the discovery of the Facilitating Cell (FC), a novel $CD8^{+}TCR^{-}$ bone marrow-derived cell, and the development of FCR001, an investigational allogeneic cell therapy product that could achieve chimerism and tolerance in highly HLA mismatched donor-recipient pairs, allowing for complete withdrawal of all immunosuppression without rejection.

Results: A Phase 2 living donor kidney tolerance protocol at Northwestern and Duke Universities has achieved a 70% success rate in the ability to remove all immunosuppression therapy 12 months post-transplant in living donor transplant recipients receiving FCR001 and non-myeloablative conditioning. The therapy is successful in highly HLA mismatched related and unrelated donor-recipient pairs. Durable donor chimerism, as defined by T-cell or whole blood chimerism greater than 20% donor at 6 months post-transplant, was established in 27 subjects, 26 of whom were successfully weaned off of all immunosuppression at 1 year post-transplant.

Conclusions: None of the 26 subjects have had kidney allograft rejection episodes or development of DSA, and all have maintained normal renal function with normal protocol biopsies over a follow-up period of 3 to 11 years post-transplant. Importantly, 1, 3, 6, and 12-month chimerism levels are highly correlated with each other and increasingly predictive over time of ability to withdraw IS at 1 year, suggesting that peripheral blood chimerism could be a valuable surrogate marker of efficacy. The present analysis explores factors influencing the time course and durability of hematopoietic chimerism in the setting of tolerance induction in living donor kidney transplantation.

Abstract# 19

Solid Organ Transplant Recipient Attitudes Towards a SARS-CoV-2 Vaccine

M. Ou[1], B. Boyarsky[1], L. Zeiser[1], T. Chiang[1], J. Ruddy[1], S. Rasmussen[1], J. Martin[2], J. Russell[2], C. Durand[1], R. Avery[1], W. Werbel[1], M. Cooper[3], A. Massie[1], D. Segev[1], J. Garonzik-Wang[1], *[1]Johns Hopkins, Baltimore, MD, [2]National Kidney Foundation, New York, NY, [3]Medstar Georgetown Transplant Institute, Washington, DC*

Purpose: An effective and widely-accepted SARS-CoV-2 vaccine could protect the community and vulnerable populations. We investigated the attitudes of solid organ transplant recipients (SOTRs) towards a SARS-CoV-2 vaccine and identified potential barriers to vaccination.

Methods: We conducted a national survey of SOTRs between November 11 - December 2, 2020 through the network and social media platforms of the National Kidney Foundation. We studied 3 major domains: a) attitudes towards a vaccine, b) impact of the pandemic on daily life, and c) impact on mental health.

Results: Among 1308 SOTRs, 783 (59.9%) were female and 1035 (79.1%) were White. Respondents were evenly distributed throughout the US and were largely college graduates (829, 63.4%) and married (830, 63.5%). Half (647, 49.5%) of SOTRs would be either unsure or unwilling to receive a SARS-CoV-2 vaccine once available (Table 1). Major concerns included side effects (537, 85.2%), lack of rigor in vaccine development (439, 69.7%), and incompatibility with organ transplant (482, 75.4%). However, 1135 (86.8%) SOTRs would be willing to receive a vaccine if recommended by a transplant provider. A small fraction (161, 12.3%) were in self-isolation and severe anxiety related to the COVID-19 pandemic remained low (25, 1.9%). There were no significant differences in vaccine attitudes after the announcement of 94.5% efficacy in the mRNA-1273 vaccine (Moderna, Inc.).
Conclusions: Transplant recipients expressed large amounts of skepticism in a potential SARS-CoV-2 vaccine, even after announcements of high vaccine efficacy. However, transplant providers may be the defining influence in vaccine acceptance due to the trust vested in them.

Table 1. Barriers to vaccine acceptance

	Transplant recipients, n (%)
Participants unsure/unlikely to vaccinate	647 (49.5%)
Specific concerns about vaccine (n = 630)	
Side effects	537 (85.2%)
Lack of rigor in testing	439 (69.7%)
Newness	378 (60.0%)
Vaccine contents	364 (57.8%)
Efficacy	345 (54.8%)
Need more information (n = 639)	
Recommendation from doctor	511 (80.0%)
Personal health compatibility	482 (75.4%)
Personal immunity	188 (29.4%)
Timing regarding state of pandemic	174 (27.2%)
Cost	151 (23.6%)
Antivaccine beliefs, attitudes, emotions (n = 628)	
Others should get it first	204 (32.5%)
Uncomfortable with vaccines	90 (14.3%)
Fear of vaccines	33 (5.3%)
Don't need any vaccine	28 (4.5%)
Don't believe vaccine will work due to bad vaccine experiences	27 (4.3%)
Religious beliefs	11(1.8%)
Vaccines don't work in general	10 (1.6%)
Don't need because already infected	8 (1.3%)
Doubts or mistrust (n = 622)	
Vaccine development process	298 (47.9%)
The government	221 (35.5%)
Pharmaceutical companies	183 (29.4%)
CDC	105 (16.9%)
Vaccines in general	48 (7.7%)

*n refers to the number of survey participants who provided a response.

Abstract# 20

Systematic Screening of Kidney Transplant Patients Points Towards Deficits in Neutralizing Antibody Capacity Against Sars-cov-2

V. Wijtvliet[1], K. K. Ariën[2], J. Mariën[2], B. Peeters[3], R. Hellemans[4], A. Massart[4], S. Van Hees[1], P. Moons[5], H. Theeten[6], P. Van Damme[6], H. Goossens[7], B. Y. De Winter[1], K. J. Ledeganck[1], D. Abramowicz[4], *[1]Laboratory of Experimental Medicine and Pediatrics, University of Antwerp, Antwerp, Belgium, [2]Department of Biomedical Sciences, Institute of Tropical Medicine and University of Antwerp, Antwerp, Belgium, [3]Department of Laboratory Medicine, Antwerp University Hospital, Antwerp, Belgium, [4]Department of Nephrology and Hypertension, Antwerp University Hospital, Antwerp, Belgium, [5]Biobank, Antwerp University Hospital, Antwerp, Belgium, [6]Centre for the Evaluation of Vaccination, Vaccine and Infectious Disease Institute, University of Antwerp, Antwerp, Belgium, [7]Department of Medical Microbiology, Vaccine & Infectious Disease Institute, University of Antwerp, Antwerp, Belgium*

Purpose: The majority of kidney transplant recipients (KTR) is able to develop SARS-CoV-2 antibodies (Abs). Little is known about the virus neutralizing capacity of these Abs.
Methods: KTR were systematically screened for SARS-CoV-2 at the Antwerp University Hospital by nasopharyngeal swab and serum sampling for the detection of respectively SARS-CoV-2 RNA and SARS-CoV-2 IgG Abs using an in-house Luminex assay. Results of Abs against the nucleocapsid protein (NP) and Receptor-Binding Domain (RBD) of the spike protein were expressed as Median Fluorescence Intensities (MFI). Virus neutralisation assays were performed on serum samples of patients with SARS-CoV-2 Abs or a positive RT-PCR test and on samples of an age and sex matched control group of 23 COVID-19 positive immunocompetent patients.
Results: 135 KTR were included; 13 were known to be RT-PCR positive. Of these 13, 10 (77%) tested positive for SARS-CoV-2 Abs. Antibody screening revealed two (2%) additional KTR with detectable Abs. Virus neutralizing capacity was observed in 11/12 (92%) antibody positive KTR vs. 22/23 (96%) immunocompetent antibody positive controls (p = 0.63). In patients who showed virus neutralizing capacity (expressed as sample dilution reducing the number of infected wells by 50% (NT50)), significantly higher neutralizing antibody capacity was observed in immunocompetent controls vs. KTR (median NT50 1027 (IQR 395-1601) vs. 217 (IQR 108-534); p=0.01). There was no difference in IgG-NP MFI and IgG-RBD MFI values between both groups (median IgG NP MFI 24554 (IQR 11218-27017) vs. 11387 (IQR 3062-24825); p = 0.13); median IgG RBD MFI 20302 (IQR 13464-24251) vs. 21736 (6288-24993); p = 0.85).
Conclusions: Our results suggest that KTR have lower neutralizing antibody capacity compared to immunocompetent subjects. The latter might be of high importance for future COVID-19 vaccine trials.

Abstract# 21

Clinical Outcomes of Solid Organ Transplant Recipients Treated with Remdesivir and Convalescent Plasma for Covid-19 at the Largest Transplant Center in the United States

A. Fernandez, S. Anjan, A. Chandorkar, D. de Lima, R. Zamora, L. A. Mendez-Castaner, J. Simkins, J. Camargo, M. Morris, M. Loebe, J. Bauerlein, C. O'Brien, N. Sinha, G. Burke, G. Ciancio, A. Mattiazzi, R. Vianna, L. Abbo, G. Guerra, Y. Natori, *Miami Transplant Institute, Jackson Health System, Miami, FL*

Purpose: Solid organ transplant recipients (SOTr) are at high risk for severe disease with SARS-CoV-2. Data on efficacy of potential treatment options and long-term outcomes are lacking. We describe our experience with use of remdesivir and convalescent plasma in SOTr with COVID-19.
Methods: Single-center, retrospective cohort study of SOTr diagnosed with SARS-CoV-2 infection by PCR from March 1st to September 30th, 2020. Multivariate logistic regression analysis was performed based on univariate analysis to identify the risk factors for higher mortality.
Results: 129 SOTr were identified (Table. 1). Median time from transplant to diagnosis of infection was 27 (IQR, 8-73) months. 48 (37.2%) and 27 (21%) patients received remdesivir and convalescent plasma, respectively (Table 2). 5/48 (10.4%) patients developed mild transaminitis that did not warrant discontinuation of therapy. No adverse effects were seen with convalescent plasma. Anti-metabolite agents were decreased or stopped in majority of the patients (81%). During follow-up, 12 (9%) patients developed clinically suspected acute rejection. Death, graft loss, and secondary infection occurred in 15 (12%), 20 (16%), and 20 (16%) recipients,

respectively. RT-PCR negativity was achieved at a median of 37 (IQR, 25-41) days. Risk factors identified for high mortality were elevated creatinine (p=0.029, Odds ratio[OR] 1.5, 95% Confidence Interval[CI] 1.0- 2.1) and older age (p=0.003, OR 1.1, 95% CI 1.0 - 1.2) at the time of diagnosis.

Conclusions: SARS-CoV-2 RT-PCR positive SOT recipients in our cohort had favorable outcomes. Use of remdesivir and convalescent plasma was found to be safe. Older age and elevated creatinine at the time of diagnosis were found to be risk factors for higher mortality.

Table.1 Characteristics of SOT recipients with COVID-19

Abstract# 22

Development and Durability of Sars-cov-2 Antibodies Among Solid Organ Transplant Recipients

B. Boyarsky, M. Ou, R. Greenberg, M. Krach, R. Wang, T. P. Chiang, W. Werbel, R. Avery, W. Clarke, A. Tobian, A. Massie, D. Segev, J. Garonzik-Wang, *Johns Hopkins, Baltimore, MD*

Purpose: The response to SARS-CoV-2 may be blunted in transplant recipients, impacting reinfection risk, treatment selection, and vaccine protocols. We quantified antibody response and durability after COVID-19 in solid organ transplant recipients (SOTRs).

Methods: SOTRs with PCR-confirmed COVID-19 were recruited through the EMR August 21-October 15, 2020. Participants underwent at-home blood sampling with the TAP™ Blood Collection Device, Second Edition (7SBio, Medford, MA). Serum samples were screened using Elecsys® anti-SARS-CoV-2 immunoassay (Roche), which uses a recombinant protein representing the nucleocapsid antigen. Confirmatory testing was performed using EUROIMMUN anti-SARS-CoV-2 enzyme-linked immuosorbent assay (ELISA) for semi-quantitative detection of IgG antibodies to spike protein (anti-S1-IgG), a likely correlate of neutralizing immunity.

Results: Eighteen SOTRs were studied, for whom COVID-19 occurred at a median of 6 years (IQR 2-9) post-transplant. Median age was 56 years (IQR 42-63); 56% were female; 33% were Black and 11% were Hispanic. Most participants (89%) had experienced COVID-19 symptoms; 72% were hospitalized. Among those hospitalized, 15% were admitted to the ICU and 8% were mechanically ventilated. COVID-19 convalescent plasma (CCP) was administered to 3 kidney and 2 lung recipients. At median 98 days (IQR 55-147) after COVID-19 diagnosis, 78% had

reactive screening immunoassays (Table 1). Of the four patients with non-reactive immunoassays, 2 were the lung recipients treated with CCP and 1 was the kidney recipient receiving IVIg. Of those who screened positive, anti-S1-IgG was detectable in 83%. SOTRs who received CCP and/or IVIg were less likely to develop anti-S1-IgG and had lower antibody levels.

Conclusions: We found antibody levels suggestive of neutralizing immunity in the majority of participants. However, those who were administered CCP and/or IVIg were less likely to mount a durable immune response. This raises the possibility that exogenous antibody preparations may blunt durable antibody formation. We observed a significant association between more severe disease and higher antibody levels. Seropositivity might decline over time; however, we were unable to distinguish between impaired production or rapid decrement. Our findings are important for individuals with compromised immune systems, whether deliberately for conditions like organ transplantation and cancer, or naturally in the elderly, frail, and autoimmune populations.

Table 1. Seropositivity, Hospitalization, and Mean Signal-to-Threshold Values of Anti-SARS-CoV-2 Antibodies Among Solid Organ Transplant Recipients with Prior COVID-19.

	Overall (n=18)	Outpatient (n=5)	Hospitalized (n=13)	
			No CCP or IVIg (n=7)	*CCP or IVIg (n=6)*
Total reactive anti-SARS-CoV-2 antibody by screening Immunoassay, n (%)	14/18 (78)	5/5 (100)	6/7 (86)	3/6 (50)
Total reactive anti-S1-IgG by ELISA, n (%)	10/12 (83)	3/4 (75)	5/6 (83)	2/2 (100)
Signal-to-threshold value, mean (median) (Arbitrary Unit ratio)*	5.9 (5.2)	4.4 (5.0)	7.5 (7.7)	3.9 (3.9)
Days since COVID-19 diagnosis, median (IQR)	98 (55-147)	141 (106-147)	129 (67-166)	51 (3-65)

Abbreviations: ELISA, enzyme-linked immunosorbent assay; SARS-CoV-2, severe acute respiratory syndrome coronavirus 2; SOTR, solid organ transplant recipient

*Optical density of the sample about the threshold at serum dilution of 1:101 divided by calibrator provided arbitrary unit ratio (A.U.) for which ≥1.1 was considered positive and ≥0.8 were considered indeterminate.

Abstract# 23

Polyfunctional T-cell Impairment to Sars-cov-2 Coronavirus in Solid Organ Transplant Recipients with Acute Covid-19 Infection

A. Favà[1], L. Donadeu[2], V. Pernin[3], M. Meneghini[1], E. Crespo[2], N. Sabé[4], L. Lladó[5], J. Gonzalez-Costello[6], O. Thaunat[7], O. Bestard[1], *[1]Kidney Transplantation Unit, Bellvitge University Hospital- IDIBELL, L'Hospitalet de Llobregat. Barcelona, Spain, [2]Experimental Nephrology Laboratory, IDIBELL, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [3]Kidney Transplant Unit, Hospital de Montpellier, Montpellier, France, [4]Infectious Disease Department, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [5]Liver Transplant Unit, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [6]Heart Transplantation Unit, Bellvitge University Hospital, L'Hospitalet de Llobregat. Barcelona, Spain, [7]Department of Transplantation, Edouard Herriot Hospital Lyon, Lyon, France*

Purpose: The emerged COVID-19 pandemic caused by SARS-CoV-2 has paralyzed the world, due to its high infectivity and fatal outcomes, especially among more vulnerable individuals. While description of protective humoral and T-cell immune responses has been reported among immunocompetent (IC) individuals, its characterization and determinants of poorer outcomes among the at-risk Solid Organ Transplant (SOT) patient population has not been thoroughly investigated.

Methods: SARS-CoV-2-specific serological and functional T-cell immune responses against main immunogenic antigens were tracked in 28 SOT recipients during acute infection and over the following 40 days of convalescence and were compared to 16 IC patients admitted with similar moderate/severe COVID-19.

Results: We show a more severe polyfunctional T-cell and serological impairment in SOT at the infection onset as compared to IC individuals, especially against membrane antigen.

Worse clinical outcomes (need of mechanical ventilation or death) more frequently occurred within SOT and were associated with a significantly impaired Th1 polarized immune response to antigens spike and membrane. Nonetheless, SOT achieved robust serological and functional Th1 and Th2 immune responses at convalescence, similarly to those of IC patients.

Conclusions: Our data show a delay of serological and functional T-cell immune activation to SARS-CoV-2 in SOT, which may entail poorer clinical outcomes.

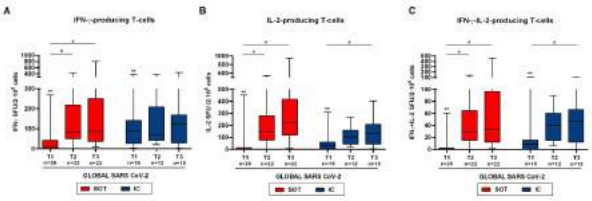

Figure 1: Global T-cell responses specific to SARS-CoV-2 at different time-points
T1 = 16, IQR 12-19 days after symptoms onset; T2 = 32, IQR 25-37 days, and T3 = 49, IQR 43-53 days; respectively.

Abstract# 24

Longitudinal Antibody Response and Viral Loads in Covid-infected Organ Transplant Recipients

T. M. Marinelli, V. H. Ferreira, M. Ierullo, V. Kulasingham, B. Majchrzak-Kita, C. Rotstein, S. Husain, S. Hosseini, A. Humar, D. Kumar, *UHN, Toronto, ON, Canada*

Purpose: The full spectrum of COVID-19 disease and the impact of disease severity on antibody response and viral shedding dynamics in transplant patients is unclear. The aims of this study were to determine the outcomes COVID-19 in SOT recipients, and correlate disease severity with antibody response and viral dynamics following SARS-CoV-2 infection.

Methods: We performed a single-centre, prospective, observational study of adult SOT patients infected with COVID-19 and followed patients for 4 weeks. Severe disease was defined as either hospitalization attributable to COVID-19 or death. SARS-CoV-2 serology using available sera was assessed by a commercial anti-nucleoprotein (NP) assay (Abbott). Viral loads on serial nasopharyngeal swabs were assessed using real time RT-qPCR (Norgen Biotek).

Results: Between March and November 2020, 55 SOT recipients had PCR-confirmed SARS-CoV-2 infection. 78.2% were male with a median age 55 years (IQR 43-65), median time post-transplantation of 6 years (IQR 1.6-11.5). Transplant types were kidney (53.7%), liver (20.4%), lung (13.0%), kidney-pancreas (9.3%) and heart (3.7%). The majority of patients (65.5%) had >=2 comorbidities other than transplantation. Hospitalization occurred in 55.6% and 33.6% required supplemental oxygen. Other outcomes were ICU admission (16.7%), mechanical ventilation (13.0%), ECMO (1.9%), and all-cause mortality (5.6%). All deaths were lung transplant recipients. On univariate analysis, factors significantly associated with severe disease were >=2 comorbidities (p=0.034), and African-American race (p=0.015). Immunosuppression was reduced in 66.7% of cases, most commonly the antiproliferative agent. A subgroup of patients (n=26) underwent SARS-CoV-2 antibody testing and 23/26 (88%) had antibodies by day 14 post-symptom onset. The three negative patients had mild disease. A subgroup of patients (n=23) had serial nasopharyngeal swabs for viral load. The median duration of positivity was 15 days (IQR 10-24) (Fig 1,2). The median peak VL measured was 4,669 copies/mL (IQR 274 to 103,038 copies/mL). Peak viral load and duration of shedding were not significantly different between hospitalized and non-hospitalized groups (p=0.59 and p=0.52 respectively).

Conclusions: SOT patients experience a spectrum of COVID-19 although mortality was low in our cohort likely due to greater capture of mild cases in the outpatient population. Virus is shed for long durations despite most transplant recipients generating SARS-CoV-2 directed antibody responses.

Abstract# 25

Attitudes Towards Covid-19 Vaccination in an Inner-city Population of Kidney Transplant Patients (Ktx)

P. Kerner, A. Imas, G. Udod, L. Gruffi, M. Goldberg, A. Saleh, K. Cruickshank, M. Markell, *SUNY Downstate Health Sciences University, Brooklyn, NY*

Purpose: Kidney transplant recipients are at high risk for complications from COVID-19 infection and prevention is important. We studied attitudes toward vaccines including willingness to take a COVID-19 vaccine in a population of inner-city KTx.

Methods: A telephone survey was conducted in summer 2020 in a random sample of 34 KTx patients regarding attitudes and knowledge about vaccines and compared with data that were collected from 28 pts in 2019. Statistics were by t-test or Pearson r as appropriate.

Results: In 2020 mean age was 57.5 ± 10.8 yrs, 18 (55%) males and 15 (46%) females, 21 (66%) black, 5 (16%) Hispanic, 3 (9%) white, 3 (9%) other. 4 (12%) did not finish high school, 14 (43%) completed high school, 15 (35%) finished some college or more. Time since transplant was 8.3 ± 6.5 yrs. 14 (41%) had diabetes. There were no differences between 2019 and 2020 for age, gender, race, time since txp or education. Compared to 2019, KTx in 2020 were more likely to agree that vaccines prevent severe illness (p=0.001) but were more concerned that vaccines could have serious side effects (p=0.023) and reported feeling more comfortable discussing concerns with doctors (p=0.016). For 2020 education level inversely correlated with belief that vaccines prevent severe illness (r = -0.41, p = 0.019). Patients with diabetes expressed less concern about vaccines than those without (p = 0.013). There were no differences in vaccine attitudes with respect to age, gender, or race. When asked if they would take a COVID-19 vaccine 12 (36%) responded "yes" and 21 (64%) responded "no". Education level inversely correlated with agreement (r = -0.45, p = 0.010). There were no differences with respect to age, gender, or race. When asked about primary sources of information on vaccines 21 (66%) said health professionals, 9 (28%) said their own research, 1 (3%) said news, and 1 (3%) said religion. Compared to patients who said health professionals, pts who reported own research had a higher level of education (p = 0.039), believed themselves to be more knowledgeable about vaccines (p = 0.031), and expressed more concern that vaccines can lead to serious side effects (p = 0.030).

Conclusions: In our population: 1) Compared to 2019, KTx in 2020 were more likely to believe that vaccines prevent illness, were more concerned with vaccine safety but felt more comfortable expressing their concern to their doctor. 2) Pts with diabetes had fewer concerns about vaccines. 3) Pts with higher education were more likely to question and express concern about vaccines. 4) The majority of pts would not accept a COVID-19 vaccine at this time, especially those with higher education who report doing their own research to find information. 5) Once the vaccine becomes available, an intensive education program will have to be created so that vaccine acceptance rises in this vulnerable, inner-city population.

Abstract# 26

Early Detection of SARS-CoV-2 and Other Infections in Solid Organ Transplant Recipients and Household Members Using Wearable Devices

E. H. Li[1], E. Mukhtar[1], E. D. Elftmann[1], F. R. Eweje[1], H. Gao[1], L. I. Ibrahim[1], R. G. Kathawate[1], A. C. Lee[1], K. A. Moore[1], N. Nair[1], S. Amaral[2], M. Snyder[3], B. J. Keating[1], *[1]Department of Surgery, Penn Transplant Institute, Division of Transplantation, Philadelphia, PA, [2]Department of Pediatrics, The Children's Hospital of Philadelphia, Philadelphia, PA, [3]Department of Genetics, Stanford University, Palo Alto, CA*

Purpose: Wearable devices that measure physiological parameters have shown utility for detecting infections such as influenza and recently COVID-19 up to 10 days before clinical symptoms appear. Combining symptom data with wearable biosensor data has proven to increase discrimination between COVID-19 and non-COVID-19 infection compared to using symptom data alone (AUC 0.80 vs. 0.71, p<0.01). Here we study the utility of wearable devices in early detection of SARS-Cov2 and related infections in pediatric solid organ transplant recipients. Early remote detection of infections may guide treatment responses to improve clinical outcomes such as rates of hospitalization.

Methods: This is an ongoing prospective cohort study of pediatric solid organ transplant recipients and their non-transplanted household members. We are currently remotely recruiting all participants from multicenter sites and heart, liver and lung transplant patients from a single transplant center. We continuously monitor heart rate (HR), body temperature, oxygen saturation, blood pressure, sleep and respiratory patterns, and electro-dermal activity. We use MyPHD, a HIPAA compliant information architecture that supports EHR integration, for remote patient recruitment, secure data collection, and analyses. We apply two real-time algorithms to the data to identify changes that are associated with COVID-19. The algorithms are based on Resting Heart-Rate-Difference (RHR-Diff) and identify periods of elevated HR based on outlier interval detection, calculating standardized residuals for each HR observation compared to a baseline of clinically validated "healthy days" for each patient.

Results: Continuous real-time physiological monitoring of transplant patients may provide syndromic surveillance and inform healthcare management. The primary outcome is time to infection diagnoses, with a particular emphasis on SARS-CoV2 and common post-transplant infections (Influenza, EBV, CMV, and BK virus). The secondary outcomes are to optimize our algorithms for the pediatric transplant setting and to monitor for other complications including cardiometabolic complications and eGFR decline.

Conclusions: The potential impact of this study include algorithm-guided early detection of infection signatures coupled with provider clinical-decision-support and return-of-results to manage transplant patient care.

Kidney

Kidney Deceased Donor Allocation

Abstract# 27

Clinical Outcomes and Racial Impact of HLA Matching in the Australian Deceased Donor Kidney Transplantation Program, 2000-2018

M. Gramlick, M. Heer, *Department of Surgery, John Hunter Hospital, Newcastle, Australia*

Purpose: The Australian deceased donor (DD) kidney transplant program places a large emphasis on HLA matching despite a known disadvantage to ethnic minority groups. We assessed the clinical outcomes of deceased donor kidney transplants in Australia, and the impact of the current allocation policy on racial minority groups.

Methods: A retrospective cohort analysis of adult DD kidney transplants from 2000-2018 was conducted using prospectively collected ANZDATA records. Transplants were divided into "Matched" or "Waitlist" allocation groups based on the OrganMatch score, the transplant state, and the current national and state-based allocation algorithms in use in Australia.

Results: Of the 7440 transplant events, 40% were Matched transplants. Matched transplants had a small benefit in renal function (67 vs 64mL/min/1.73m2 at 1 year; 66 vs 62 at 10 years), lower incidence of rejection (23% vs 30%, p<0.001), longer graft survival (median 5.5 vs 4.5 years, p<0.001), and longer patient survival (HR 0.89 (0.78, 1.01), p=0.07) compared to waitlist transplants. A higher proportion of Caucasian (2566/5631, 45%) compared to Aboriginal and Torres Strait Islander

(56/309, 18%) recipients received a Matched transplant. Dialysis time was significantly shorter for Matched transplants (28.1 vs 44.8 months, p<0.0001), and contributed significantly to the benefit seen in graft and patient survival in Matched transplants.

Conclusions: Deceased donor kidney transplants which are well-matched continue to out-perform transplants which are poorly matched, however a significant component of this benefit is via decreased time on dialysis. Ethnic minority groups are less likely to receive a well-matched kidney, spend longer on dialysis, and are disadvantaged by the current allocation model.

Abstract# 28

Allocating Kidneys in Optimized Circles: Logistics are More Important Than Distance

R. Saidi, R. Shahbazov, M. Hanlon, M. laftavi, *SUNY Upstate, Syracuse, NY*

Purpose: The OPTN recently proposed removing Donation Service Area (DSA) and regional boundaries used in the current kidney allocation system (KAS) and allocate organs within a 250 nautical mile (NM) radius centered on the donor hospital. The goal of this proposal is to increase equity in access for U.S. kidney transplant (KT) candidates.

Methods: In our program, the majority of renal allografts are imported from distances ranging from 150-4800 miles. In order to study the impact of distance on cold ischemia time (CIT), delayed graft function (DGF), patient and allograft outcomes, we studied 263 import KT performed from 2014 to 2020 and compared outcomes to locally procured KT (n=178). Zero miss-matched KT were excluded from the study. Donor and recipient demographics were similar in both groups. Induction and maintenance immunosuppression were also similar in both groups.

Results: CIT was significantly higher in the imported group compared to local KT (27.6 vs. 15.9 hrs. p< 0.0001). Notably, the distance traveled by imported KT did not impact CIT (R2= 0.07, Fig 1). Distance did not impact the rate of DGF in both groups (imported 21% vs. local 22%, p=0.74). Furthermore, in the imported group, distance had no correlation with the DGF. Patient and allograft survival rates were similar in the imported vs. local KT group. In a multivariate analysis distance did not affect allograft or patient survival.

Conclusions: We conclude that distance alone does not correlate with CIT and DGF as well as allograft and patient survival. There are many logistical factors and OPO factors that impact significantly on CIT. We postulate that the impact of distance is affected by many issues and cannot be predicted by travel mileage alone. Improvements in transportation options and logistics can improve utilization of organs and decrease the discard rate especially for high KDPI renal allografts.

Abstract# 29

Status of Kidney Allocation in Liver-kidney Transplants Before and After the UNOS/OPTN Policy

J. Oveyssi, M. Hussain, P. Homkrailas, S. Bunnapradist, *Department of Internal Medicine: Division of Transplant Nephrology, UCLA, Los Angeles, CA*

Purpose: On August 10, 2017 the United Network for Organ Sharing (UNOS) enacted policies 9.7 and 8.5G to establish medical criteria for simultaneous liver-kidney (SLK) and the "safety net". One of the goals of these policies was to preserve higher quality kidneys for at risk kidney transplant candidates. Prior to these policies nearly half of the kidney grafts transplanted for SLK purposes had a kidney donor profile index of < 35%. We aim to understanding the impact of the policy on kidney grafts for liver transplant candidates.

Methods: Kidney transplant recipients who had previously undergone liver transplantation listed between October 1 1987 to April 1, 2020 were identified from the UNOS master datafile. Groups were divided based on transplant date of January 1, 2018. Recipients of a SLK or previous kidney transplant were excluded. We examined the mean and median KDPI of the kidneys transplanted and the average time to kidney transplant.

Results: A total of 12,216 kidney transplants were performed following liver transplant during the study period. A total of 2033 kidney transplants were performed after January 1 2019. The mean (standard deviation) and median KDPI values before January 2018 were 37.5 % (±26.1%) and 33.0% respectively. After January 2018, they were 39.1% (± 24.6%) and 37.0% respectively (p-value 0.008). 1,575 age matched kidney after liver transplants were performed before 2018 and 260 procedures after 2018. The mean (±SD) and median KDPI values before and after January 2018 were 55.0% (±25.2%), 58.0% and 56.0%(±25%) and 59.0%, respectively (p-value 0.6). The average time to transplant was reduced by 27 days after 2018 (p-value 0.0001).

Conclusions: The intended goals of policies 8.5G and 9.7 have been achieved, albeit modestly, since their inception. Additional follow up is needed to ensure that these policies continue to provide a safety net for liver transplant recipients without disadvantaging at risk kidney transplant candidates.

Abstract# 30

The Association Between Environmental Determinants and High KDRI Organ Offer Acceptance Ratios

A. M. Placona, C. Martinez, M. Stuart, *United Network for Organ Sharing, Henrico, VA*

Purpose: Increasing the number of transplants could be realized by increasing high KDRI organ utilization. While the impact of transplant center (TXC) aggressiveness and competition on kidney offer acceptance is known, little is known about how changes in the donor pool affects acceptance rates (O to E ratio). Resource Dependence Theory posits that increased munificence (donor pool) could induce deceases in high KDRI acceptance ratios. Our questions are how stable are acceptance ratios for high KDRI kidneys over time, and do changes in donor volume affect acceptance patterns of high KDRI organs?

Methods: We collected kidney PTR data from 2015 to 2019. Replicating SRTR risk-adjusted offer acceptance models, we calculated O to E ratios for each KDRI strata each year. We calculated TXC volumes, number of kidneys recovered per DSA, and the HHI Index per DSA (a measure of competition) for each year from the OPTN STAR file. Examining the high KDRI strata, we examined the Spearman correlation between 2015 O to E ratios and 2019 O to E ratios; in addition, we leveraged the panel analysis methods of first difference estimators and robust clustered errors to control for omitted variables and autocorrelation. The dependent variable was the logarithmic transformation of acceptance ratio. Independent variables were the log of the number of donors, log of transplant volume, log of prior year's acceptance ratio, and HHI.

Results: The Spearman correlation between 2015 acceptance ratios and 2019 acceptance ratios was **.46.** Regression analysis indicates that increases in donor volume was negatively (-.54) and near significant (p=.0975). Increases in transplant volume were positive (.77) and statistically significant (p<.0001). Previous year's O to E ratio was negative (-.301) and statistically significant (p <.0001). Adjusted R squared was **.1867**.

Conclusions: Results indicate the previous year's performance, in terms to O to E ratios, may reflect either a regression to the mean effect or strategic decisions by TXCs. Since the dependent variable was log transformed and centered around zero, it could also reflect general changes in the national benchmark. That said, the Spearman correlation indicates that rank ordering does change over time as exhibited in Table 1. While our hypothesis about the number of recovered kidneys was near *significant,* directionally a 1% increase in donor volume is associated with **.53%** decrease in high KDRI offer acceptance. Future research should examine whether increases or decreases in the donor pool interact with PSR ratings from the prior year.

	Percentage of Total TXCs drift between 2015 and 2019 OE quartiles*			
Quartiles	>75th	>50th up to 75th	>25th up to 50th	<=25th
> 75th	10.63%	6.38%	5.67%	2.84%
>50th up to 75th	6.38%	7.80%	5.67%	4.26%
>25th up to 50th	4.96%	4.96%	7.80%	6.38%
<= 25th	2.83%	5.67%	5.67%	11.35%

Abstract# 31

Kidney Transplantation in Very Highly-Sensitized Patients with Maastricht Type III Non-heart-Beating Donors

F. Villanego[1], A. Mazuecos[1], L. Vigara[1], V. Lopez[2], G. Bernal[3], A. Rodriguez-Benot[4], M. de Gracia[5], P. Castro[6], A. Alvarez[6], *[1]Department of Nephrology, Hospital Puerta del Mar, Cadiz, Spain, [2]Department of Nephrology, Hospital Carlos Haya, Malaga, Spain, [3]Department of Nephrology, Hospital Virgen del Rocio, Sevilla, Spain, [4]Department of Nephrology, Hospital Reina Sofia, Cordoba, Spain, [5]Department of Nephrology, Hospital Virgen de las Nieves, Granada, Spain, [6]Andalusian Transplant Coordination, Sevilla, Spain*

Purpose: In 2012, a kidney transplant (KT) program for very highly-sensitized (VHS) patients (PRA ≥ 95%) based on virtual crossmatch began in Andalusia (Spanish region). Initially these patients used to receive grafts from brain-death donor (BDD). However, the development of Maastricht type III non-heart-beating donation (NHBD) in Spain led to the incorporation of these donors in 2018 in order to increase the donation pool.

Methods: Retrospective cohort study of deceased donor KT recipients within the Andalusian VHS patient program from August 2012 to April 2020. To compare the results between BDD and NHBD KT, we performed a case-control study with a minimum follow-up of 3 months. For each case of NHBD, the 4 closest BDD controls were selected according to the KT date. Clinical and demographic variables were analyzed. Kaplan Meier survival analysis and Cox regression multivariate analysis were performed for graft survival risk factors.

Results: During this period, 172 KT were performed in Andalusia in VHS patients, of which 26 belongs to NHBD.

A total of 130 KT were selected according to inclusion criteria (4 BDD: 1 NHBD). The median follow-up time was 547.5 days. Of them, 54.6% were women with a mean age of 50.4 years. A 68.5% of the patients received prior KT and they had a median PRA of 98% [96, 99]. The median time on the waiting list was 1487.5 days and 345 days since their inclusion in the VHS program until KT. Graft survival in the first year after KT was 90.5%. There were no differences when comparing graft survival between BDD and NHBD (p = .184). In the multivariate analysis, an older donor age and time preKT on renal replacement therapy were risk factors for graft survival. The age of the recipient was a protective factor.

Conclusions: The exchange based on virtual crossmatch facilitates the access to KT in VHS patients, shortening the time on the waiting list. In our program, the donor and recipient age and the time on renal replacement therapy influenced graft survival, but not the type of donor, so Maastricht type III NHBD may be considered a valid option for VHS patients.

Abstract# 32

Impact of CHA2DS2-VASc Score on Postoperative Mortality Following Kidney Transplant

J. Klein[1], M. Rangel[1], Z. Spigel[2], E. Hollinger[1], D. Olaitan[1], M. Hertl[1], E. Chan[1], *[1]Surgery, Rush University Medical Center, Chicago, IL, [2]Surgery, Allegheny Health Network, Pittsburgh, PA*

Purpose: This study aimed to assess the correlation between CHA2DS2-VASc score and postoperative kidney transplant survival. The conditions captured in the CHA2DS2-VASc score are commonly found in patients undergoing kidney transplant and are the leading causes for mortality in this patient population.

Methods: A retrospective chart review of all patients over 18 undergoing kindey transplant between 2009 and 2019 at a single institution was conducted. 1034 patients were identified, and after inclusion and exclusion criteria were identified, 987 patients were analyzed (Figure 1).

Results: 987 patients were stratified into three groups based on CHA2DS2-VASc score (0-1, 2-3, 4+). Not surprisingly, survival probability decreased over time following kidney transplantation. Median follow-up was 5.7 years (IQR 3.7-8.7). At one year there was a 94% survival rate, which decreased to 86% survival at 6 years. When comparing groups, the highest (4+) score group had at least a 64% higher risk in mortality compared to the lowest score group (HR 2.88, 95% CI 1.64-5.04, p<0.001). When controlling for the other components of the score, diabetes (HR 1.94; 95%CI 1.32-2.8, p<0.001) and peripheral vascular disease (HR 1.63; 95%CI 1.15-2.3, p=0.006) were associated with higher mortality. Age 65-74 (HR 1.71; 95%CI 1.21-2.4, p=0.003) was associated with higher mortality than age <65.

Conclusions: A CHA2DS2-VASc score of 4+ is associated with increased mortality following kidney transplantation, with diabetes, peripheral vascular disease, and older age the three independent contributory components. Current allocation algorithms incorporate age and diabetes, but inclusion of either CHA2DS2-VASc score or presence of peripheral vascular disease may help more appropriately allocate organs. This knowledge can be beneficial moving forward as transplant teams judge which donor offers to accept for an increasingly older population with more comorbidities.

Abstract# 33

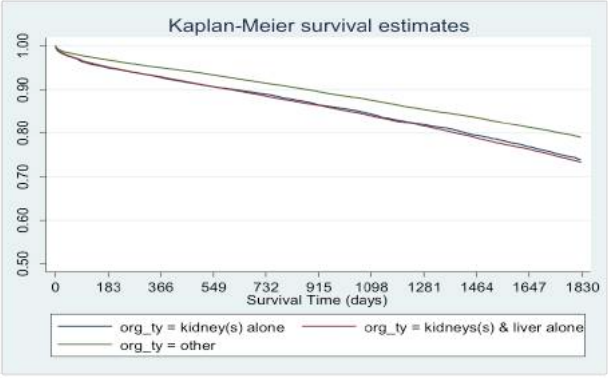
Renal Transplant Outcomes of Kidney-only vs. Multi-organ Deceased Donors

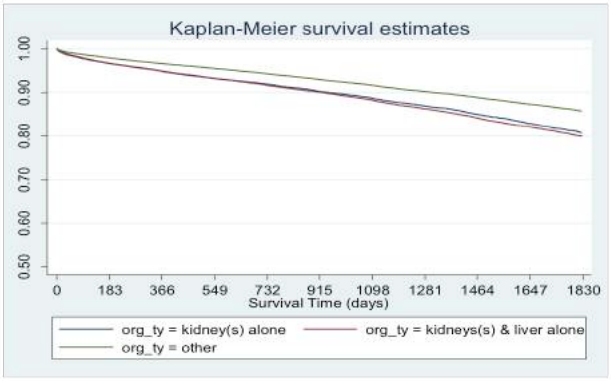
J. Espinales[1], Z. C. Giffen[1], D. Schneider[2], R. James[3], N. Koizumi[3], O. Ekwenna[1], J. Ortiz[4], *[1]University of Toledo Medical Center, Toledo, OH, [2]UC Irvine School of Medicine, Irvine, CA, [3]George Mason University, Arlington, VA, [4]Albany Medical Center, Albany, NY*

Purpose: We sought to determine the relative outcomes of kidneys from kidney-only or multi-organ deceased donors.

Methods: Scientific Registry of Transplant Recipients data from 2010-2019 were reviewed. Deceased donors were stratified into three groups: kidney-only donors (KOD), kidney/liver-only donors (KLOD), and multi-organ donors (MOD). The impact of donor type was evaluated using a multivariate Cox proportional-hazards model, controlling for KDPI. Primary outcome was death-censored recipient graft survival.

Results: Recipients of KOD/KLOD were younger, more likely to be male, and less likely to be white as compared to MOD (all p<0.01). Kidney-only recipients were more likely to be prior transplant recipients and less likely to be preemptive renal transplant recipients (both p<0.01). KOD were more likely to be donation after circulatory death (p<0.01). MOD had lower KDPI as compared to kidney- or kidney/liver-only procurements (p<0.01). Kidneys recovered from MOD were associated with a 2.4% reduced risk of recipient graft failure (HR = 0.976). MOD were associated with improved recipient survival (p<0.01).





Conclusions: Recipients of MOD grafts had better graft outcomes despite adjusting for KDPI. It is possible that more intensive perioperative monitoring of multi-organ donors, which serve to impact a greater number of recipients, is responsible for better renal graft outcomes for these recipients. These data may impact future decisions on graft allocation, and MOD status should be considered for addition to future allocation calculators.

Abstract# 34

Construction of a Waiting Time Predictive Model for Kidney Transplant with Deceased Donor in the State of São Paulo

J. Silva[1], M. Contti[1], M. Valiatti[1], H. Nga[1], G. Santos[1], M. Perosa[2], G. Ferreira[3], L. Modelli de Andrade[1], *[1]UNESP, Botucatu, Brazil, [2]Hospital Leforte, São Paulo, Brazil, [3]Santa Casa de Juiz de Fora, Juiz de Fora, Brazil*

Purpose: Chronic kidney disease is an important public health problem and kidney transplant is the therapy of choice when possible. The transplant system in the State of São Paulo, Brazil is a valuable sample. Few investigations study the waiting time for kidney transplant with a deceased donor, therefore, developing a predictive model can contribute to better allocating the patients. Objectives: determine the predictors for waiting time on the list for kidney transplant, verify the applicability of the allocation criteria, and create a predictive model of waiting time.

Methods: Retrospective cohort study. All patients listed for transplantation between Jan/2000 to Dec/2017 in the database of the São Paulo State Department of Health were included. Variables studied: age, sex, race, baseline disease, regional reference centres, dialysis duration, ABO blood group, panel class I, HLA-A, HLA-B, HLA-DR, blood transfusions, pregnancies, and previous transplants. The data were randomly separated: 75% for training and 25% for model validation testing. Cox regression was performed having the transplant as the outcome. Sensitivity analyses were carried out in regional reference centres and regression analyses were carried out with competitive outcome.

Results: We analysed 54,055 records. In the period, 28.5% of the patients were transplanted (n = 13,694), WITH a higher probability in the first 50 months. The main factors that reduced the chance of transplantation were: Panel> 80%, belonging to the regional School of Medicine of the University of São Paulo (FMUSP) and blood type O. Factors associated with higher chance of transplantation: age <18 years, presence of anti-HBc and blood type AB. A predictive model was obtained capable of predicting the waiting time on the transplant list with excellent agreement in internal validation (c-index = 0.70).

Conclusions: Allocation system that is effective in prioritizing recipients under 18 and patients with greater compatibility in the HLA system. Patients with reduced chances of transplantation were those who were sensitized, those from blood group O, and those with HLA homozygosity. Regional differences were found which favoured centres with a lower number of patients placed on the transplant list. A predictive model that can help in the predictability of the transplant was created.

Paired Exchanges in LDLT- A Good Option for Patients with Incompatible Donors

A. Humar, C. Hughes, G. Mazariegos, S. Kyle, A. Gallatin, K. Emmett, A. Tevar, M. Molinari, A. Ganoza, V. Gunabushanam, S. Ganesh, *University of Pittsburgh, Pittsburgh, PA*

Purpose: In the US, paired exchanges are common for LD kidney transplant but not for LDLT. We present our series of paired exchanges for LDLT, all done at a single large volume US LDLT program.

Methods: Data was collected on all donors and recipients that underwent paired exchange LDLTs at our center.

Results: A total of 8 paired exchanges (16 total transplants) were completed over the last 2 years. Of these, 3 involved ABO incompatible pairs with matched related donors for each recipient. The other 5 involved a non-directed donor, which was then used to initiate the paired exchange with an ABO incompatible donor/recipient pair. In all cases, the non-directed donor was blood type O. The 2nd recipient in these cases was chosen from the deceased donor list based on factors such as MELD/PELD, size match, and anatomic suitability. Living donor advocacy and psychosocial evaluation were done as in standard LDLT. Both transplants were performed within 1 week of each other. All 16 donors are well with no major complications. Of the 16 recipients, 15 were adults and 1 was pediatric. 15 recipients are alive and well with good graft function. One recipient died in the early postoperative period.

Conclusions: Paired exchange is technically feasible in a large volume LDLT center and can be a useful way to perform transplants in incompatible pairs. Use of a non-directed donor to initiate the exchange is a good option.

Abstract# 36

Impact of Advanced Renal Dysfunction on Post-Transplant Outcomes After Living Donor Liver Transplantation in the United States

T. Bittermann[1], N. Kaur[2], P. L. Abt[1], K. M. Olthoff[1], J. K. Heimbach[3], J. Emamaullee[2], *[1]University of Pennsylvania, Philadelphia, PA, [2]University of Southern California, Los Angeles, CA, [3]Mayo Clinic College of Medicine, Rochester, MN*

Purpose: Survival after living donor liver transplantation (LDLT) in the U.S. is excellent. However, the significance of pre-transplant kidney disease on outcomes after LDLT is poorly understood.

Methods: This was a retrospective cohort study of 2,843 LDLT recipients nationally between 1/2010-6/2020. Baseline characteristics of recipients with estimated glomerular filtration rate <40mL/min/1.73m^2 (eGFR-low) or requiring dialysis were assessed. Multivariable survival analyses evaluated (i) eGFR-low as a predictor of post-LDLT survival, (ii) the survival of LDLT versus deceased donor liver transplant (DDLT) alone with eGFR-low.

Results: From 2010-2020, 140 (5.0%) patients had eGFR-low and 18 (0.6%) required dialysis pre-LDLT. The number of LDLTs requiring dialysis between 2017-2020 outnumbered the prior 7 years (Figure - Panel A) and heterogeneity in center experience was observed (Panel B). Nearly half (5/12) of eGFR-low recipients with active kidney transplant listing at LDLT experienced renal recovery. Overall LDLT case volume was higher at centers performing LDLT in recipients with renal dysfunction (p<0.001). Accounting for baseline clinical differences, eGFR-low independently predicted post-LDLT mortality (adjusted HR 1.63; p=0.01). However, the adjusted survival of patients with eGFR-low receiving LDLT versus DDLT alone was not different (p=0.08). Of the 8 total deceased-donor KTs performed within the first year post-LDLT, 5 were facilitated by the new 'safety-net' KT policy.

Conclusions: Overall, outcomes after LDLT with advanced renal dysfunction are acceptable. These findings are relevant given the recent 'safety net' kidney transplant policy.

Abstract# 37

Impact of Community- Targeted Educational Campaign on Living Donor Transplants

S. Ganesh, A. Humar, *Transplant, UPMC, Pittsburgh, PA*

Purpose: There is an urgent need to expand access to living donor liver transplants due to a wide gap in the availability of deceased donor organs. We developed a structured educational awareness campaign and a support program, designed to overcome barriers to identifying potential live liver donors for waitlisted recipients. While most live donations are targeted at specific recipients, increasing public awareness has led to an increase in anonymous, altruistic, and unrelated donors, defined as individuals willing to donate without a previously known recipient. The aim of this study was to determine the impact of the program on identification of such live donors.

Methods: We looked at the number of donor registrations at our tertiary-care, academic medical center. The structured program included the following steps: Educational campaign to general public which was launched in October of 2018, E Blasts, and Webinars through Advocacy groups including UNOS, Donate Life America, to create awareness and educate the general public on living donation, along with creating awareness in the social media including Face book. We looked at the number of altruistic or anonymous, unrelated donors who registered, that successfully underwent or qualified for donor evaluation, since the launch of the program.

Results: Since October of 2018 through September of 2020, a total of 8076 potential donors registered through the donor database. Of these individuals, 2757 (34%) were qualified based on the initial screening on the data base. 118 (4.2%) qualified for full donor evaluation and 40 (1.5%) either underwent donation or approved to donate.

Conclusions: A structured program designed to identify potential live donors for waitlisted liver transplant recipients resulted in an unexpected increase in identification of unrelated, anonymous, and altruistic live donors. Continued education and awareness is essential for the ongoing process

Abstract# 38

Trends in Liver Donors for Liver Transplantation Over Twenty Years: Donor Changes in Gender, Relationships, and Education, but Racial Disparities Remain

A. Kaplan, B. Fortune, R. Brown, MD, MPH, B. Samstein, K. Halazun, R. Rosenblatt, *Gastroenterology and Hepatology, New York Presbyterian/ Weill Cornell, New York, NY*

Purpose: Living donor liver transplant (LDLT) has grown over the past several decades as a response to critical organ shortages. Racial and ethnic disparities exist in recipients of liver transplant but have not been studied in the living donor population. We thus examined demographic changes in living donors over time.
Methods: Adult living donors who donated to adults were identified from 1998-2018 using the United Network for Organ Sharing (UNOS) database. Annual trends as well as trends across three eras were analyzed: pre-MELD (Model for End-Stage Liver Disease) (1998-2002), post-MELD (2003-2014), and post-DAA (Direct-acting antivirals) (2015-2018). The primary outcomes of interest were to examine demographic changes over time in living donors with regard to gender, race/ethnicity, education, and relationship. Annual trends were compared using annual percent change (APC), while comparisons across the time periods were assessed using chi-squared test.
Results: There were 4,769 LDLTs (4.25% of all transplants) between 1998 and 2018. While initially men donated more (55% in the pre-MELD era), the percentage of female donors increased annually (APC 0.9%, 95% CI 0.4-1.4) and ultimately comprised 53% in the post-DAA era. There were no significant changes over time with regard to race/ethnicity of donors; however, Whites made up a significant majority of living donors across all time periods ($p<0.001$). The percentage of Black donors remained low—4.5% in pre-MELD and falling to only 3% in post-DAA era. Of those with documented education, there was a significant change in education level over time, with increasing percentages of donors with higher education levels (APC 3.7%, 95% CI 2.9-4.4 for college and APC 8.6%, 95% CI 7.1-10.2 for post-college)—77% of living donors had college education or above in post-MELD era. Lastly, there was a significant change over time in donors' relationships to recipients with increasing percentages of child, paired, and anonymous donations while decreasing percentages of sibling and spouse donations ($p<0.001$).
Conclusions: Female and highly educated living donors are increasingly common and now represent the majority of donors for LDLT. Blacks appear underrepresented in living donation and this disparity has persisted for the last 20 years. Through future, prospective research, it will be important to understand why these disparities exist so that targeted efforts can be made to increase outreach and close the gap between organ supply and demand.

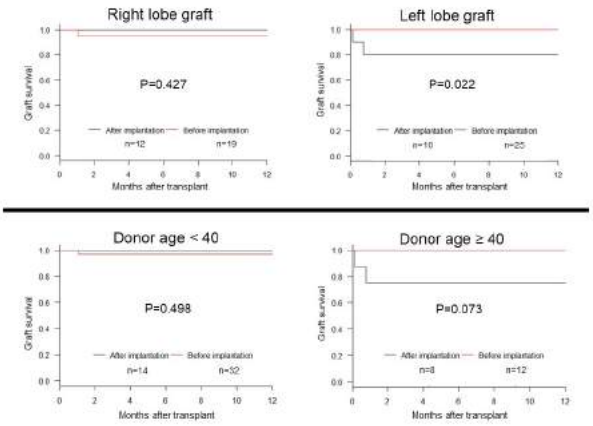
Abstract# 39

The Impact of Splenectomy on Living Donor Liver Transplantation Using Small Grafts

M. Fujiki, E. Aleassa, C. Quintini, F. Aucejo, K. Sasaki, B. Eghtesad, T. Diago, D. Kwon, C. Miller, K. Hashimoto, *Cleveland Clinic Foundation, Cleveland, OH*

Purpose: Simultaneous splenectomy with living donor liver transplantation (LDLT) is widely used in Asian countries to decrease the risk of small-for-size syndrome (SFSS). However, the impact and adverse effect of splenectomy on LDLT recipients have not been well studied in Western countries. Herein, we report our series of simultaneous splenectomy to define its impact.
Methods: Between 2012 and 2020, LDLT was performed in 118 adults using 53 left-lobe grafts (45%) with median graft-to-recipient weight ratio (GRWR) of 0.84, ranging 0.49-1.5. Very small grafts with GRWR $\leq$0.7 were utilized in 26 LDLT (22%). Total of 66 (56%) patients received splenectomy before implantation of the allograft based on pre-operative risk factors (n=44) or after implantation because of portal hyper-perfusion (n=22). Complications related to splenectomy, incidence of SFSS, graft survival and the risk of early graft dysfunction (EGD) were analyzed. Furthermore, the impact of pre-implantation splenectomy opposed to post-implantation was assessed.
Results: There was no increase in surgical, thrombotic or infectious complications after simultaneous splenectomy compared to no-splenectomy group. Overall graft survival was 94%, 90%, and 84% at 1-, 3-, and 5-years, respectively with no difference between splenectomy and no-splenectomy group. Despite the aggressive use of small graft, SFSS developed in only one patient and EGD was observed in 15 patients (13%). Multivariable Cox regression revealed MELD score and left-lobe graft as independent risk factors of EGD and splenectomy as a protective factor (odds ratio, 0.104; p=0.036). Furthermore, among patients who received left-lobe, small grafts (GRWR $\leq$ 0.8), or grafts from donor age $\geq$ 40 years, patients who underwent pre-implantation splenectomy had better 1-year survival rate than those receiving post-implantation splenectomy.



Conclusions: Favorable overall graft survival with mitigated risk of graft dysfunction can be achieved with simultaneous splenectomy in LDLT using small grafts. Pre-implantation splenectomy may have a protective effect especially for grafts with an increased risk of SFSS.

Abstract# 40

Re-Do Hepatic Artery Reconstruction for Thrombosis Can Save Grafts and Patients without Retransplantation: Lessons Learned from 1,355 Adult Living Donor Liver Transplantations

S. Hong, N. Yi, K. Hong, E. Han, S. Suh, J. Lee, S. Hong, Y. Choi, U. Jin, H. Chang, K. Lee, K. Suh, *Seoul National University Hospital, Seoul, Korea, Republic of*

Purpose: Hepatic artery thrombosis (HAT) after liver transplantation is associated with a marked increase in morbidity, being the main cause of graft loss and bile duct complication leading patients' deaths. Retransplantation is often unavailable in most Asian countries due to donor organ shortage. Herein, we evaluated the outcome of patients with HAT after adult living donor liver transplantation (ALDLT) under aggressive surgical correction strategy.

Methods: From January 2000 to June 2019, 1,355 recipients underwent ALDLT in Seoul National University Hospital. Surgical redo reconstruction for HAT was applied in every case except the evidence of graft necrosis or late detection (since postoperative day 60) of HAT. Median follow-up period was 89 months. Survival outcomes and the rates of biliary complication of patients with HAT were compared with others without HAT.

Results: Postoperative HAT was developed in 33 cases (2.4%) at a median time of 3.5 days (range 1-82). Overall graft survival rates were lower in patients with HAT (84.8%) than others without HAT (98.0%) (P<0.001). However, patient survival rates were similar between two groups (72.7% *vs.* 83.8%, P=0.115). Biliary complication rates were higher in patients with HAT (54.5%) than others without HAT (32.0%) (P=0.008). Among 33 patients with HAT, 30 patients (90.9%) underwent redo arterial reconstruction. The technical success rate of redo reconstruction was 83.3% (n=25). After redo-reconstruction, 3 patients (10.0%) underwent retransplantation and 76.6% of patients (n=23) were finally survived. Another 3 patients with HAT underwent conservative management (n=2) and retransplantation directly (n=1).

Conclusions: HAT after ALDLT was associated with increased rates of biliary complication and significantly attenuates graft survival outcome. However, aggressive surgical treatment can save the graft in 90% without retransplantation and patient survival was not affected.

Abstract# 41

Death Among Living Liver Donors- Are We Overestimating the Risk?

H. J. Braun, A. M. Shui, N. L. Ascher, J. P. Roberts, *University of California, San Francisco, San Francisco, CA*

Purpose: In the United States, the estimated risk of death associated with live liver donation is currently quoted at 0.1% for left lobe donation, and 0.4-0.6% for right lobe donation. However, these numbers are based on historical data. The purpose of this study was to examine death rates in living liver donors in the United States between 2002-2020 in order to update this risk estimate. We hypothesized that the risk of death between 1-6 in 1000 liver donors would be an overestimate in the present day, particularly as the United States has accrued additional experience with live donor liver transplantation.

Methods: United Network for Organ Sharing (UNOS) data was obtained on living liver donors who underwent donor hepatectomy between June 1, 2002 and June 10, 2020. Liver donors for domino transplants were excluded. We defined two eras; Era 1: June 1, 2002-June 15, 2011 and Era 2: June 16, 2011-June 1, 2020. Death rates among the two eras were compared at the 75th, 90th, and 95th confidence intervals.

Results: A total of 5497 liver donors underwent donor hepatectomy during the time period, of whom 5150 had follow up data available for analysis. Of these 5150, 2477 occurred during Era 1 and 2673 occurred during Era 2. A total of eight deaths occurred, with four deaths in each era. Causes of death, and time frame of death, as reported by UNOS, are shown in Table 1.

The cumulative incidence of donor deaths was 0.14% in the entire study period, and was 0.16% in Era 1 and 0.15% in Era 2. In Era 1, 3 live liver donors died within the first 90 days after donation (1.2 deaths per 1000 donors; 95% CI 0.2-3.5; 90% CI 0.3-3.1; 75% CI 0.5-2.6). In Era 2, 4 live liver donors dies within the first 90 days after donation (1.5 deaths per 1000 donors; 95% CI 0.4-3.8; 90% CI 0.5-3.4; 75% CI 0.7-2.8). There was no statistically significant difference between these rates (p=0.78).

Conclusions: In the United States, the risk of death associated with living liver donation remains extremely low. In contrast to the historical quoted risk of death of 0.1-0.6%, our findings suggest that the risk of death may actually be closer to 0.1-0.2%. Importantly, the 95% confidence intervals of our estimates for death rates in both eras do not include the previously upper limit of 6 deaths per 1000 donors. These conclusions are limited by a lack of granular data, but suggest that living liver donation may be safer than previously thought.

Living Liver Donor Deaths by Cause and Time Interval

	Era 1 (n=2477)			Era 2 (n=2673)

Abstract# 42

Liver Live Donor Champion: Advocacy Training to Facilitate Identification of Living Liver Donors

L. R. Herbst, Y. Yu, A. Love, K. Lee, A. Wells, K. Mohr, A. Massie, A. Gurakar, B. King, D. L. Segev, A. M. Cameron, J. Garonzik Wang, *Johns Hopkins University, Baltimore, MD*

Purpose: Liver transplant candidates face several barriers to finding a potential live donor (PLD), such as lack of education or knowledge, or discomfort approaching others about living donation. The Live Donor Champion (LDC) intervention has helped kidney transplant candidates address and overcome these barriers. We created and piloted a liver-oriented LDC to determine feasibility and translatability for liver transplant candidates.

Methods: We conducted a single-center Liver LDC pilot study of 43 adult, active liver transplant candidates and their champions. The Liver LDC is a three-month intervention to train champions for this advocacy role. We measured participant knowledge and comfort throughout the intervention. We compared outcomes of pilot participants to transplant candidates on our waiting list at the same time.

Results: Pilot participants had a median age of 57 years old, median BMI of 29, were 58% female, 79% White, and had a median waitlist time of 925 days (Table 1). Candidate and champion knowledge scores were higher after completing the LDC program (from 85% to 90%, p=0.058). Additionally, 47% of participants received at least one PLD inquiry, with an average of 6 PLDs. During the study period, 7

(16%) participants received a DDLT and 4 (12%) participants received an LDLT. Compared to non-program participants on the waitlist at our center, LDC participants were 3.31 times more likely to receive an LDLT (SHR: $_{1.07}$ 3.31 $_{10.26}$) (Figure 1).
Conclusions: Liver LDC may increase knowledge about living donation and liver transplantation and help transplant candidates identify PLDs and undergo LDLT.

Heart: Triple "D" in Heart Transplantation: DCD, Dual-Organ and Declined Hearts

Abstract# 43

Steroid-free Immunosuppression in Heart-Kidney Transplant Patients: Is It Safe?

R. Skorka, J. Patel, M. Kittleson, N. Patel, T. Singer-Englar, A. Velleca, B. Azarbal, D. Chang, E. Kransdorf, L. Czer, D. Megna, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

Purpose: Simultaneous heart and kidney transplantation (sHKTx) has increased in numbers over the past 10 years. There are reports that the kidney protects the heart from rejection. Currently, it is common to wean off prednisone after 6 months post-transplant in patients who have had no rejection episodes. This practice has not been performed routinely in sHKTx. Therefore, we reviewed our sHKTx patient population for those patients taken off prednisone compared to those left on prednisone and assessed their subsequent outcome.
Methods: Between 2010 and 2018, we assessed 50 sHKTx patients. 13 of these patients were weaned off prednisone within the first year after transplantation and 37 patients remained on prednisone. The endpoints included subsequent 1-year survival, 1-year freedom from cardiac allograft vasculopathy (CAV, as defined by stenosis ≥30% by angiography), and subsequent 1-year freedom from acute cellular rejection (ACR) and antibody-mediated rejection (AMR). Creatinine and glomerular filtration rate (GFR) were used to assess renal function pre- and post-prednisone wean.
Results: Patients who were weaned from prednisone compared to those that were not exhibited similar subsequent 1-year survival (100% vs. 94.5%), freedom from CAV (92.3% vs. 100%), and freedom from ACR (100% vs. 100%) and AMR (100% vs. 97.3%). In addition, renal function was not affected by the prednisone wean. (See table)
Conclusions: Steroid-free immunosuppression appears safe in sHKTx patient. Larger number of patients will be needed to confirm these findings.

Endpoints	sHKTx Patients Weaned Off Prednisone (n=13)	sHKTx Patients Not Weaned Off Prednisone (n=37)	P-value
Creatinine @ Start of Wean	1.34 ± 0.40	1.47 ± 0.87	0.597
Creatinine @ End of Wean	1.29 ± 0.25	1.27 ± 0.86	0.937
GFR @ Start of Wean	61.23 ± 21.84	64.57 ± 30.55	0.719
GFR @ End of Wean	61.00 ± 21.78	64.31 ± 30.40	0.721

Abstract# 44

Adult Combined Liver-Heart Transplantation: The United States Experience

I. A. Ziogas[1], S. P. Alexopoulos[1], W. K. Wu[1], L. K. Matsuoka[1], M. A. Rauf[1], M. Izzy[2], R. Perri[2], K. H. Schlendorf[3], J. N. Menachem[3], A. S. Shah[4], *[1]Division of Hepatobiliary Surgery and Liver Transplantation, Vanderbilt University Medical Center, Nashville, TN, [2]Department of Medicine, Division of Gastroenterology, Hepatology and Nutrition, Vanderbilt University Medical Center, Nashville, TN, [3]Division of Cardiovascular Medicine, Vanderbilt University Medical Center, Nashville, TN, [4]Department of Cardiac Surgery, Vanderbilt University Medical Center, Nashville, TN*

Purpose: Combined heart-liver transplantation (CHLT) is now being practiced with increasing regularity and improved outcomes in the United States. We performed the most comprehensive review of all adult patients undergoing CHLT using national registry data.

Methods: All adult (≥18 years) CHLT recipients in the United Network for Organ Sharing database were included (09/1987-09/2020). Transplant era groups were generated by decade (era 1=1989-2000, era 2=2001-2010, era 3=2011-2020). Survival analysis was conducted by means of Kaplan-Meier method, log-rank test, and Cox regression.

Results: We identified 369 adult patients receiving CHLT (12/1989-08/2020). Both the number of adult CHLT recipients (R^2=0.75, P<0.001) and the number of centers performing CHLT (R^2=0.80, P<0.001) have increased over the study period. Cardiac diagnosis was different among the three eras (P=0.03); the most common in the first two eras was restrictive/infiltrative cardiomyopathy, while the most common in era 3 was congenital heart disease. During eras 1 and 2, nearly all CHLTs were sequential-heart first (100% and 97.1%, respectively), while in era 3, 79.9% were sequential-heart first, 13.8% sequential-liver first, and 6.3% simultaneous (P=0.001). The 1-, 3-, and 5-year post-CHLT cumulative patient survival rates were 86.8%, 80.1%, and 77.9%, respectively (Fig. A). Statistically significant differences in unadjusted patient survival were observed between the three transplant eras (P=0.009; Fig. B). In multivariable Cox regression, recipient diabetes (adjusted hazard ratio [aHR]=2.35, 95%CI: 1.23-4.48), receiving CHLT between 1989-2000 compared with 2011-2020 (aHR=5.00, 95%CI: 1.13-22.26), and receiving sequential-liver first CHLT compared with sequential-heart first CHLT (aHR=2.44, 95%CI: 1.15-5.18) were associated with increased risk of post-CHLT mortality. Increasing left ventricular ejection fraction was associated with decreased risk of post-CHLT mortality (aHR=0.96, 95%CI: 0.92-0.99).

Conclusions: CHLT is an increasingly performed and accessible therapy with evolving recipient demographics and disease etiologies, and excellent outcomes.

Abstract# 45

High Degree of Center Variation in Simultaneous Heart Kidney Transplant: Opportunities for Standardization

B. I. Shaw[1], M. L. Samoylova[1], S. J. Kesseli[1], D. Olaso[2], A. S. Barbas[1], D. L. Sudan[1], L. E. Boulware[3], L. M. McElroy[1], *[1]Surgery, Duke University, Durham, NC, [2]School of Medicine, Duke University, Durham, NC, [3]Medicine-Nephrology, Duke University, Durham, NC*

Purpose: Simultaneous heart kidney transplant (SHK) is increasingly common and unregulated. We sought to understand variation in patient selection for SHK at the center level.

Methods: Data for adult heart transplant recipients and candidates since 2003 were obtained from the UNOS STAR file. Variability in center practice was assessed for all centers performing at least one SHK per year in the study period. Variability in the proportion of dialysis dependent (DD) patients undergoing SHK was determined. Variability in estimated glomerular filtration rate (eGFR) at transplant among non-dialysis dependent (NDD) SHK recipients was examined, including in relationship to center volume and waitlist mortality. Center level effects on the probability of SHK among non-DD patients were investigated by multivariable logistic regression controlling for age, transplant year, eGFR, ventricular assist device usage, and diabetes status.

Results: A total 33,463 transplant recipients and 20,390 waitlist registrants were included. There was a high degree of variability in the proportion of DD patients who underwent SHK at the center level (Range 25-82%, **Figure 1A**). The median eGFR of NDD patients undergoing SHK at the time of transplant varied widely both between (Range 19-56 mL/min/1.73m^2) and within centers (**Figure 1B**). There was no relationship between eGFR at transplant of SHK recipients and either center volume (p=0.448) or waitlist mortality (p=0.156). The odds of receiving SHK among NDD recipients varied widely by center with the odds ratio of the most to least SHK permissive center being 35.0 (95% CI 11.5-106.3). When examining the marginal probability of SHK, we noted that it decreased with increasing eGFR but was different between centers (**Figure 2**).

Conclusions: There is wide variation in patient selection for SHK both within and between centers. This variation may present an opportunity to improve allocation of kidneys for these dual organ transplants.

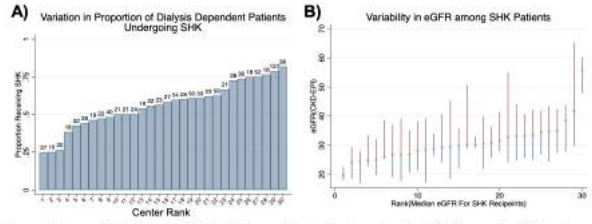

Figure 1 Legend: A) Percent of dialysis dependent patients undergoing SHK by center. Ordered By percent DD patients undergoing SHK. Bars labeled with total SHK performed by that in center In the study period **B)** Median and 95% CI of eGFR by center, ordered by median eGFR.

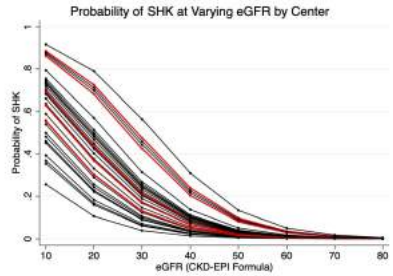

Figure 2 Legend: Marginal probability of SHK by eGFR based on multivariable logistic regression. Top 5 centers in terms of probability of SHK highlighted in red. Top 30 centers represented

Abstract# 46

Allograft Discard Risk Index for Heart Transplantation

R. M. Reul[1], A. A. Saleem[1], C. N. Keller[1], T. H. Malik[1], J. A. Goss[2], A. A. Rana[2], *[1]Office of Student Affairs, Baylor College of Medicine, Houston, TX, [2]Michael E. DeBakey Department of Surgery, Baylor College of Medicine, Houston, TX*

Purpose: The number of patients awaiting heart transplantation (HTx) substantially exceeds the number of donor hearts transplanted each year, yet nearly 70% of consented donor hearts are discarded rather than transplanted.

Methods: All deceased organ donors listed within the UNOS Deceased Donor Database between June 12, 2005 and June 12, 2020 were reviewed. Those greater than 10 years old and consented for heart donation were included and randomly separated into training (n=79,704) and validation (n=39,852) cohorts. Demographic factors were compared between groups. A univariate and multivariate analysis was run on the training set to determine factors significant for allograft discard. Those factors were then used to create the discard risk index (DSRI). Discard and mortality data were assessed at DSRI value deciles using the validation set, and stratum-specific likelihood ratio (SSLR) analysis was used to determine deciles with increased likelihood of 1-year mortality.

Results: Factors associated with higher DSRI values included donor age > 45, HCV or HBV-core antibodies, hypertension, diabetes, and prior myocardial infarction. Factors associated with lower DSRI values included donor age < 40 and trauma as

the donor cause of death. The DSRI C-statistic was 0.821 in the training cohort and 0.819 in the validation cohort. The DSRI did not reliably predict 30-day or 1-year mortality after transplantation (C-statistic 0.557 & 0.546, respectively). The highest SSLR for 1-year mortality was the top 4 DSRI deciles (SSLR 1.46). This group was used to define marginal donors. An analysis of high-volume centers (10 or more HTx per year) resulted in substantial variation in terms of marginal donor usage.
Conclusions: The factors leading to heart allograft discard have little correlation with post-transplant outcomes. This suggests that with proper allocation, allografts at higher risk for discard may be transplanted with limited impact on recipient mortality.

Abstract# 47

Waitlist and Post-Transplant Outcomes of Candidates With Lvad: Comparison of Old and New Heart Allocation Policies

M. Colvin[1], Y. Ahn[2], S. Hall[3], M. Walsh[4], A. Israni[2], *[1]Univ of Michigan, Ann Arbor, MI, [2]SRTR, Minneapolis, MN, [3]Baylor Univ, Dallas, TX, [4]St. Vincent Heart Ctr, Indianapolis, IN*

Purpose: The new heart allocation policy took effect in October 2018. Its risk stratification scheme prioritizes patients with short-term devices, raising concern that candidates with durable left ventricular assist devices (LVADs) may be disadvantaged and post-transplant (PT) outcomes compromised. We compared trends in LVAD use and outcomes under the old and new policies.
Methods: Using SRTR data, we estimated unadjusted cumulative incidence (CI) of waitlist (WL) outcomes and PT survival for heart candidates and recipients. The WL cohort included LVAD candidates 18+ years first listed in 2017 and 2019, respectively. WL follow-up was censored at death, transplant, WL removal, or the first June after the listing year. We fit a CI function to compare WL outcomes. The PT cohort included recipients with LVAD 18+ years who had transplants from 10/18/2017 to 7/31/2018 (PRE) and 10/18/2018 to 7/31/2019 (POST). PT follow-up was censored on death or 1 year after transplant. We fit unadjusted Kaplan-Meier survival curves for 30-day, 6-month, and 1-year survival.
Results: After the new policy took effect, the number of WL candidates with LVADs decreased 8%, from 1216 to 1118. Among WL candidates in 2017, 31.2% were still waiting, 3.5% died, 55.4% received transplants, and 10% were removed by 6/30/2018. Among WL candidates in 2019, 37.8% were still waiting, 1.6% died, 51.9% had transplants, and 8.7% were removed by 6/30/2020 (Table 1). The PT cohort included 1037 PRE and 771 POST recipients, a 26% decline. PRE PT mortality was 3% at 30 days, 6.3% at 6 months, and 7.7% at 1 year. POST PT mortality was 4.4% at 30 days, 7.8% at 6 months, and 9.5% at 1 year (Table 2).
Conclusions: Since implementation of the new policy, the proportion of LVAD candidates receiving transplants has declined. Although WL mortality has declined in LVAD patients, PT mortality has increased slightly, possibly from giving transplants to sicker LVAD patients. Although not statistically significant, this trend bears monitoring given the shift toward short-term devices.

Table 1. Cumulative incidence of waitlist

	Year 2017		Year 2019	
	Count	Percent	Count	Percent
Total LVAD candidates	1216	100.00	1118	100.00
Still Waiting	379	31.17	423	37.84
Died	42	3.45	18	1.61
Transplanted	674	55.43	580	51.88
Removed*	121	9.95	97	8.68

Removed*: candidates who have a removal code other than transplant or death by their followup date.
Year 2017: The cohort was followed up to 6/30/2018.
Year 2019: The cohort was followed up to 6/30/2020.

Table 2. Outcomes at 30 days, 6 months, and 1 year post-transplant

	Policy Implementation				
	Pre		Post		
	Count	Percent	Count	Percent	p-values
Total LVAD recipients	1037	100.0	771	100.0	
Alive at 30 days	1006	97.0	737	95.6	0.11
Died within 30 days	31	3.0	34	4.4	
Alive at 6 months	972	93.7	711	92.2	0.2
Died within 6 months	65	6.3	60	7.8	
Alive at 1 year	957	92.3	698	90.5	0.18
Died within 1 year	80	7.7	73	9.5	

30 days data is from the date of transplant to 30 days.
6 months data is from the date of transplant to 6 months.
1 year data is from the date of transplant to 1 year.
p-values are from unadjusted Kaplan-Meier analyses.

Abstract# 48

Liver Biopsy as a Predictor in Risk Stratification for Heart Transplant Candidates

S. Tolia[1], T. Al Saadi[1], N. Narang[2], A. Joshi[2], C. Sciamanna[2], S. Pauwaa[2], G. Macaluso[2], M. Dia[2], A. Tatooles[3], P. Pappas[3], W. Cotts[2], A. Andrade[2], *[1]Internal Medicine, Advocate Christ Medical Center, Oak Lawn, IL, [2]Cardiology, Advocate Christ Medical Center, Oak Lawn, IL, [3]Cardiovascular Surgery, Advocate Christ Medical Center, Oak Lawn, IL*

Purpose: Patients undergoing workup for Orthotopic Heart Transplant (OHT) undergo multi-organ evaluation for risk stratification. While cirrhosis is a known predictor of poor outcomes in this population, there is limited evidence regarding the impact of varying degrees of fibrosis. These patients undergo invasive liver biopsy to identify their pathology. We aimed to assess the association of baseline hepatic fibrosis severity from biopsy with clinical outcomes in waitlisted heart transplant patients.
Methods: Twenty-two patients listed for transplant underwent liver biopsy between 2008-2019. Patients with absent or sinusoidal fibrosis (grade 1) were classified as low-risk, while central, bridging and portal fibrosis (grades 2-3) were classified as high-risk. Cirrhotic patients were excluded.
Results: Among the 12 low-risk patients, 6 underwent OHT compared to the 7 of 10 high-risk patients. Congestive hepatopathy was the primary etiology of liver fibrosis in 70% of the patients. At time of listing, mean Model for End-Stage Liver Disease Excluding INR (MELD-XI), due to warfarin use, was 14 and 13 in low- and high-risk patients, respectively. We observed no significant difference in two-year survival and clinical outcomes of listed patients when stratified by degree of hepatic fibrosis (Figure).
Conclusions: There was no significant difference observed in relevant clinical outcomes and two-year survival among patients with low- or high-risk biopsies. In the absence of clear cirrhosis on lab work and imaging findings, these results may suggest a lack of significant benefit of liver biopsy in patients as part of the workup for heart transplant candidacy. Future studies should be conducted with larger data populations for ongoing analysis.

Figure. Primary and Secondary Outcomes by Grade of Fibrosis (n = 22)

Outcomes	Low-Risk n (%) n=12	High-Risk n (%) n=10	p-value
Transplanted	6 (50%)	7 (70%)	0.34
Fulminant Liver Failure	2 (17%)	0 (0%)	-
Thromboembolic	2 (17%)	2 (20%)	0.84
Bacteremia	4 (33%)	4 (40%)	0.75

Abstract# 49

Donor Factors Associated with In-field Decline of Heart Allografts

L. Piechura, F. Yazdchi, M. Harloff, H. Shim, M. Keshk, A. Coppolino, III, D. Rinewalt, H. Mallidi, *Brigham and Women's Hospital, Boston, MA*

Purpose: The decline of organs upon assessment within the field complicates optimal organ and resource utilization. We aimed to investigate if certain donor factors were associated with the in-field decline of heart allografts.

Methods: We utilized the United Network for Organ Sharing Standard Transplant Analysis and Research database to identify all heart allograft offers from adult donors between 1987 and March 2020. We compared hearts that were declined after in-field assessment to those that were accepted for transplant during the same time period. Categorical variables were compared via chi-squared tests, and continuous variables were compared with t-tests. A multivariate logistic regression model was used to ascertain the impact of particular donor characteristics on the likelihood of in-field heart decline.

Results: Between 1987 and March 2020, 1,586 hearts were declined following evaluation in the field, while 61,871 hearts were transplanted. Hearts that were declined were more often from older donors (37±11 vs 33±11 years, p<0.001) with higher BMI (27.8±6.4 vs 26.6±5.6, p<0.001). The cause of death for donors of declined hearts was more often anoxia (26 vs 17%, p<0.001) or cerebrovascular accident (33 vs 25%, p<0.001). Donors of declined hearts also more often had a clinical infection (64 vs 49%, p<0.001), required inotropic support (42 vs 35%, p<0.001), and had a history of cocaine use (19 vs 12%, p<0.001). A smaller proportion of donors of declined hearts had an AB blood type (0.4% vs 2%, p<0.001). In a multivariate logistic regression model developed from factors significant by univariate assessment, we found that death via natural circumstances (OR 1.34, p=0.008), Public Health Service increased-risk designation (OR 1.27, p=0.001), total bilirubin (OR 1.05, p=0.001), donor age (OR 1.03, p<0.001), and serum BUN (OR 1.01, p<0.001) were associated with a higher odds of in-field heart decline.

Conclusions: Direct in-field evaluation of heart allografts is essential prior to organ acceptance. However, we have identified risk factors that may warrant further investigation prior to allocating limited healthcare resources. Understanding the potential influence of these variables on in-field decline may ultimately contribute to streamlining organ allocation and procurement processes.

Abstract# 50

Waitlist and Post-Transplant Outcomes of Candidates with Iabp or Ecmo: Comparison of Old and New Heart Allocation Policies

M. Colvin[1], Y. Ahn[2], S. Hall[3], M. Skeans[2], M. Walsh[4], A. Israni[2], *[1]Univ of Michigan, Ann Arbor, MI, [2]SRTR, Minneapolis, MN, [3]Baylor Univ, Dallas, TX, [4]St. Vincent Heart Ctr, Indianapolis, IN*

Purpose: New heart allocation policy prioritizes candidates on short-term circulatory support to promote transplant of the sickest candidates. There has been a shift in the use of these devices as a bridge to transplant. We compared the use and outcomes of candidates with IABP or ECMO before and after the new policy.

Methods: Using SRTR data, we estimated unadjusted cumulative incidence (CI) of waitlist (WL) outcomes and post-transplant (PT) survival for adult heart candidates and recipients. The WL cohort included IABP or ECMO (SCSD) candidates 18+ years first listed in 2017 and 2019, respectively. WL follow-up was censored at death, transplant, WL removal, or the first June after the listing year. We fit a CI function to compare WL outcomes. The PT cohort included recipients with SCSD 18+ years who underwent transplant from 10/18/2017 to 7/31/2018 (PRE) and 10/18/2018 to 7/31/2019 (POST). PT follow-up was censored on death or 1 year after transplant. We fit unadjusted Kaplan-Meier survival curves for 30-day, 6-month, and 1-year survival.

Results: After implementation of the new allocation policy, the number of WL candidates with SCSD increased 137%, from 284 to 673. In 2019, 83% of SCSD WL candidates underwent transplant, versus 56% in 2017. In 2017, most SCSD candidates were listed as status 1A, and 61% received transplants. In 2019, most SCSD candidates were listed as status 1 or 2; 79% and 88% of them, respectively, received transplants (Table 1). The PT cohort included 192 and 746 recipients PRE and POST, respectively, a 289% increase. PT survival among PRE was 94.3% at 30 days, 89.6% at 6 months, and 88% at 1 year. PT survival POST was 96.1% at 30 days, 92% at 6 months, and 89.9% at 1 year.

Conclusions: Since implementation of the new policy, the number of recipients with SCSD and their survival, have increased slightly. Although the increase is not statistically significant, new strategies for advanced heart failure management may be needed given the increasing use and improved outcomes of short-term devices.

Table 1. Cumulative incidence of IABP or ECMO (SCSD) Waitlist, by waitlist status and urgency status

	Year 2017					Year 2019							
	Total	Status 1A	Status 1B	Status 2	Inactive	Total	Status 1	Status 2	Status 3	Status 4	Status 5	Status 6	Inactive

Pancreas & Small Bowel

Abstract# 51

Risk Factors for the Development of Posttransplant Lymphoproliferative Disorder (ptld) After Pancreas Transplantation- A Registry Analysis

A. Gruessner, S. Saggi, J. Renz, R. Gruessner, *SUNY Downstate Medical Center, Brooklyn, NY*

Purpose: A pancreas transplant provides patients with brittle diabetes the opportunity of good long-term metabolic control. However, it requires long-term immunosuppression with its associated risks including development of PTLD. Although immunosuppressive protocols have become standardized over the last decade, including regular use of antibody induction therapy, reports on the incidence of, and risk factors for, short- and long-term development of PTLD are scarce.

Methods: To assess the incidence of PTLD 13,287 primary successfully transplanted pancreas transplants (82% SPK, 10% PAK and 8% PTA) were included; transplants were performed between 1/1/2006 and 12/31/2019 and reported to the IPTR/UNOS. Median follow-up time was 68 months. The incidence of PTLD was based on the UNOS reports or information about PTLD leading to graft failure. Description of patient and donor characteristics was generated. To define risk factors for the development of PTLD several multivariable Cox regression models with time dependent variables were established including factors which proved to be significant in the univariate model. Possible risk factors were transplant type, transplant year, recipient and donor age, gender, ethnicity, EBV and CMV serology, HLA mismatch, depleting and non-depleting induction therapy, maintenance immunosuppression, and the treatment of acute rejection episodes of the pancreas and/or kidney.

Results: A total number of 160 cases of PTLD were identified - in SPK, 110 cases; in PAK, 27; and in PTA, 23. The 1-year (5-year) rate of PTLD were: for SPK, 0.4% (0.9%); for PAK, 0.2% (1.7%): and for PTA, 1.7% (2.3%). The rate in solitary pancreas transplants was significantly higher compared to SPK ($p<0.0001$), see Figure 1. The EBV serostatus of 76% of the recipients and 80% of the donors was positive. In 12 % of recipients and 13% of donors the EBV serostatus was unknown. The result of the first cox regression identified solitary pancreas transplant, negative EBV recipient serostatus, male gender, white race, induction therapy with depleting antibodies, and acute rejection treatment as risk factors. No significant impact of the interaction between recipient and donor EBV serology was found. A more detailed analysis is shown in Table 1.

Conclusions: The rate of PTLD was higher in solitary transplants: they received more immunosuppression than SPK due to their increased immunogenicity. Negative recipient serostatus carried the highest risk for the development of PTLD. Of note, the risk of PTLD was high when Campath or TMG for more than 4 days was given for induction therapy.

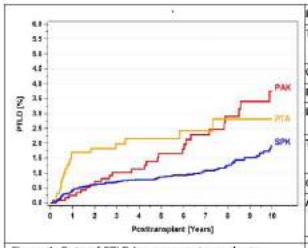

Figure 1: Rate of PTLD in pancreas transplants performed between 2006 and 2019

Parameter		P	HR	CI95%	
Tx Type	PAK vs SPK	0.04	1.58	1.03	2.44
	PTA vs SPK	0.014	1.83	1.13	2.95
Gender	Male vs Female	0.008	1.61	1.13	2.30
Race	Black vs White	0.002	0.35	0.17	0.69
EBV Serostatus	Negative vs Positive	<.0001	4.60	3.25	6.49
Tmg days_	1-4 vs 0	0.76	1.06	0.66	1.75

Abstract# 52

Evaluation and Experience with Hepatitis C Positive to Negative Pancreas Transplantation

B. K. Lindner, B. Thomas, M. Cooper, S. Yi, P. Abrams, *Medstar Georgetown University Hospital, Washington, DC*

Purpose: The use of hepatitis C virus (HCV) positive organs for transplant to HCV negative recipients has been reported on and has gained popularity across kidney, liver, heart, and lung transplantation. Currently, limited reports discuss HCV positive to negative transplantation specifically in pancreas transplantation. The most recent SRTR/OPTN Report shows < 0.3% of all pancreas transplants are HCV(+) to (-). The presented study examines a cohort of HCV(-) pancreas recipients who received HCV(+) grafts.

Methods: This is a single center, retrospective study of pancreas transplant recipients from May 2019 - October 2020. Patients were included if they received a HCV(+) (NAT+/Ab+ or NAT-/Ab+) transplant and were HCV(-) (NAT-/Ab-) at the time of transplant. Patients that seroconverted and developed a positive viral load were initiated on direct acting antiviral therapy once approved by their insurance post-transplant. Patients were considered cured if they exhibited sustained virologic response rates (SVR) 12 weeks following the end of therapy. Outcomes assessed include waitlist time, time to medication obtainment, viral clearance, and graft survival.

Results: Six simultaneous kidney-pancreas recipients were included in this study. Five patients (83.3%) had NAT(+) donors while 1 (16.7%) had a NAT(-)/Ab(+) donor. The average time from listing to transplantation was 82 days, and 3 out of 6 patients were transplanted within 15 days of their listing date. Of the 5 patients who received NAT+ grafts, 3 (60%) were treated with glecaprevir/pibrentasvir and 2 were treated with sofosbuvir/velpatasvir. The average time from transplant to the start of HCV therapy was 41 days, all paid for by commercial insurance. All patients (n=3) who are 12 weeks past the end of therapy have achieved SVR12. The patient who received a NAT(-)/Ab(+) graft has remained HCV(-) for all 11 months post-transplant. There have been no graft failures or rejection episodes, however one patient died 2 months post-transplant (not thought to be related to HCV or the treatment regimen). All other patients remain off insulin and have a mean creatinine of 1.4 mg/dL.

Conclusions: Hepatitis C negative kidney-pancreas transplant recipients can safely receive HCV(+) grafts and be cured of HCV post-transplant similar to other organ groups. Benefits in terms of waitlist time reduction and long-term outcomes will need to be studied further

Abstract# 53

Simultaneous Pancreas-kidney Transplantation (spk) and, Simultaneous Deceased Donor Pancreas and Living Donor Kidney Transplantation (splk) in Diabetic Patients with End Stage Renal Disease

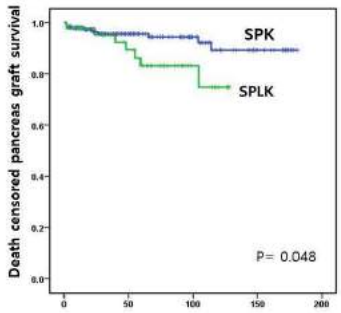
Y. Ko, *Department of Surgery, Asan Medical Center, Seoul, Korea, Republic of*

Purpose: The purpose of this study is to compare clinical outcomes of simultaneous pancreas-kidney transplantation (SPK) and simultaneous deceased donor pancreas and living donor kidney transplantation (SPLK) in diabetic patients with end stage renal disease.

Methods: Data from patients who had SPK or SPLK from December, 2005 through June, 2020 at Asan medical center were retrospectively analyzed. Of 196 consecutive patients, 151 and 45 underwent SPK and SPLK, respectively. Presence of de novo DSA after transplantation, pancreas graft failure, kidney graft failure, biopsy-proven acute rejection of pancreas, biopsy-proven acute rejection of kidney were compared between the two groups.

Results: There was no significant difference in baseline characteristics between the two groups except that , cold ischemic time of kidney graft and duration of diabetes in the SPLK group were significantly shorter compared with the SPK group (331±132min vs 85±67min $P<0.001$, 21.07±6.14years vs 17.86±7.99years $p=0.004$) and donors of SPLK was younger than those of SPK (24.91±1.22years vs 32.08 ±12.13years, $p<0.001$). During ten-years follow-up, death-censored pancreas graft survival rate in the SPLK group was significantly lower compared with the SPK group ($P=0.048$). In addition, the incidence of biopsy-proven acute rejection of the pancreas graft in the SPLK group was significantly higher compared with the SPK group ($P=0.003$). There was no difference in the presence of de novo DSA and the incidences of kidney graft failure, kidney biopsy proven acute rejection and mortality between SPK and SPLK recipients.

Conclusions: It seems that there is a higher risk of death-censored graft failure and biopsy-proven acute rejection of pancreas in recipients having SPLK compared with SPK.



Duration between pancreas transplantation and pancreas graft failure (mon)

Abstract# 54

Outcomes of Simultaneous Pancreas-Kidney Transplants from Donation After Circulatory Death Donors in the UK: A National Registry Analysis

N. Karydis[1], M. Ibrahim[2], C. Counter[2], J. Casey[3], P. Friend[4], C. Watson[5], C. Callaghan[1], *[1]Nephrology and Transplantation, Guy's and St Thomas' NHS Foundation Trust, London, United Kingdom, [2]NHS Blood and Transplant, Bristol, United Kingdom, [3]Transplant Unit, Royal Infirmary of Edinburgh, Edinburgh, United Kingdom, [4]Nuffield Department of Surgical Sciences, University of Oxford, Oxford, United Kingdom, [5]Department of Surgery, Addenbrooke's Hospital and Cambridge NIHR Biomedical Research Campus, Cambridge, United Kingdom*

Purpose: The UK is a world leader in the use of pancreases from donation after circulatory death (DCD) donors. However, there is a perception that pancreases from DCD donors are sub-optimal when compared to similar grafts from donation after brain death (DBD) donors. We compared outcomes of pancreases transplanted from controlled DCD donors to those from DBD donors in the largest reported study to date.

Methods: Data were obtained from the UK Transplant Registry on deceased donor adult SPK transplants between 2005 - 2018. Kaplan-Meier estimates were used to compare pancreas, kidney, and patient survivals between those receiving organs from DCD or DBD donors, and multivariable analyses were used to identify factors associated with pancreas graft loss.

Results: 2,228 SPK transplants were implanted (1825 DBD; 403 DCD donors). Kidneys from DCD donors had equivalent graft survivals to those from DBD donors (log-rank p=0.99), and there were no differences in longer-term renal allograft function, or in five-year patient survivals when stratifying by donor type. On univariate analysis, there were no significant differences in five-year death-censored pancreas graft survival between the two donor types (Figure 1. 79.5% versus 80.4%; p=0.86). Multivariable analysis showed no significant differences in five-year pancreas graft loss between transplants from DCD (n=343) and DBD (n=1492) donors (hazard ratio 1.26, 95% CI 0.76-1.23; p=0.12). A Cox proportional hazards regression model for pancreas graft loss from DCD donors showed that increasing donor age or pancreas cold ischaemic time (CIT) were not associated with worse outcomes.

Conclusions: This large national study supports the increased utilisation of organs from DCD donors in SPK transplantation. Data on the effect of donor age and CIT on DCD donor graft outcomes suggest that a re-examination of donor age criteria and the pancreas offering schemes are warranted.

Abstract# 55

Two Hundred Total Pancreatectomy with Islet Autotransplantation Cases: A Single Center Experience

K. Kumano[1], S. Bruer[1], G. Saracino[1], M. Lawrence[1], G. Testa[1], A. Gupta[1], N. Onaca[1], E. Beecherl[1], M. F. Levy[2], B. Naziruddin[1], *[1]Baylor University Medical Ctr, Dallas, TX, [2]Virginia Commonwealth University, Richmond, VA*

Purpose: Total pancreatectomy and islet autotransplantation (TPIAT) for patients with uncontrolled chronic pancreatitis has been performed at our center from 2006 and the number of TPIAT patient has reached 200 in 2020. We have attempted to improve the transplant outcome over time using novel anti-inflammatory treatment regimen utilizing combined use of anakinra (IL-1β blocker) and etanercept (a tumor necrosis factor-alpha (TNF-α) blocker). It is still challenging to standardize our procedure and predict outcomes after TPIAT. Therefore, we retrospectively reviewed our large data of islet isolation results and metabolic outcome in order to contribute to making further progress with TPIAT.

Methods: Our database of 200 consecutive TPIAT procedures performed between 2006 and 2020 were retrospectively reviewed. We collected the data of baseline demographics, pancreas characteristics and islet isolation results. Patient follow-up were performed at 3 and 6 months, 1 year, and then annually. Our outcomes measures included islet graft function, pain relief and narcotic use.

Results: Baseline patient characteristics (age, sex, BMI, etiology, pretransplant C-peptide and hemoglobin (Hb) A1c levels, duration of symptoms) and isolation results were shown in Table 1. Post-operative non-fasting glucose, HbA1c level, C-peptide level and the average daily insulin requirement were shown in Table 2. The insulin independence rate at 3, 6 and 1 year increased with time (15.4%, 24.0% and 26.7%, respectively), comparable results reported previously. At 1 year, pain score was significantly improved (pre: 6.1±2.7, 1year: 2.4±2.9, p<0.0001). Narcotic free rate also increased with time: the rates were 47% at 6 months and 56% at 1 year.

Conclusions: In our cohort of 200 patients, we showed that TPIAT effectively alleviated pain due to chronic pancreatitis. TPIAT has beneficial effect on pain relief and decrease of narcotic use. Although nearly 27% of our patients had achieved insulin independence at 1 year, further progress of islet autotransplantation procedure would be necessary to improve and maintain long term islet graft function after TPIAT.

Abstract# 56

Segmental Susceptibility of Intestinal Stem Cells to Cold Storage Preservation Injury in a Porcine Model

E. K. Ludwig[1], N. Abraham[2], D. Sudan[2], A. Barbas[2], C. Schaaf[1], J. Freund[1], A. S. Stewart[1], B. Veerasammy[1], L. M. Gonzalez[1], *[1]North Carolina State University, Raleigh, NC, [2]Duke University, Durham, NC*

Purpose: Cold storage (CS) is the current gold standard preservation method for small bowel (SB) prior to transplantation. However, CS can cause epithelial detachment, sloughing, and crypt damage. Epithelial loss can lead to bacterial translocation and sepsis, thus, epithelial regeneration is critical to both allograft and patient survival. Intestinal epithelial stem cells (ISC) are the source of epithelial regeneration, however, the extent to which CS injures ISCs, ultimately impairing epithelial repair, is unclear. Currently, allograft health is monitored post-transplantation via histologic assessment of ileal biopsies. However, the ileum may not represent overall graft health as there is histologic evidence that the ileum may either be more resistant to CS injury or may have a greater capacity to repair than other SB segments. The impact of CS on ISCs from different SB segments is not well characterized. We hypothesized that CS would negatively impact ISC viability and proliferative potential, but that the ileum would be affected less than either the duodenum or jejunum.

Methods: 9 porcine SB grafts were flushed with cold UW preservation solution and stored at 4ºC for 6h. 3-D ISC culture was used to determine the impact of CS on ISC viability and proliferative potential. Crypts isolated from duodenum, jejunum, and ileum segments obtained post-flushing (control, CO) and after 6h preservation were plated in culture. To assess ISC proliferative potential, spheroid area measurements were performed every 24h. To assess ISC viability, plating efficiencies were determined every 48h. Differences within and between groups were compared using a Kruskal-Wallis test and a Dunn's multiple comparison post-test followed by a Mann-Whitney test. Significance was set at $P<0.05$.

Results: CS jejunal spheroid area measurements were significantly smaller at all time points compared to CO tissues. When spheroid area measurements were compared between CS segments, ileal spheroids were significantly larger than duodenal or jejunal spheroids at all time points ($P<0.0001$). No significant differences were found when plating efficiencies were compared between CS and CO conditions for any segment.

Conclusions: CS injury does not appear to cause a difference in ISC viability between SB segments, but the ISC proliferative potential is significantly greater in the ileum compared to the duodenum or jejunum. Our findings are important clinically, as ileal biopsies from transplanted SB serve as the marker of the health of the allograft based on histologic morphology. As a result, the ileum may not be the best marker of graft regenerative capacity, however the addition of future porcine CS procedure data is warranted before a final conclusion can be made.

Abstract# 57

Islet Allotransplantation Into Pre-vascularized Sernova Cell Pouch™ - Preliminary Results from the University of Chicago

P. J. Bachul[1], P. E. Borek[1], G. S. Generette[1], A. Perez-Gutierrez[1], K. Jayant[1], K. Golab[1], L. Basto[1], L. Perea[1], M. Tibudan[1], C. Thomas[2], L. Philipson[2], J. Fung[1], P. Witkowski[1], *[1]Surgery, University of Chicago, Chicago, IL, [2]Medicine, University of Chicago, Chicago, IL*

Purpose: Previous first-in-human pilot study showed safety but the conditions did not allow for detectable islet function post-transplantation into the pre-vascularized Sernova Cell Pouches (SCPs) implanted subcutaneously. Herein, in the current Phase I/II study we tested clinically, islet engraftment in modified conditions after transplantation into the SCP.

Methods: First, SCPs were implanted below the anterior rectus sheath in type 1 diabetes patients with severe hypoglycemia unawareness and no stimulated C-peptide. Three weeks later Thymoglobulin, tacrolimus, and mycophenolate were initiated. During the infusion, islets were suspended in the patient's own serum instead of saline to provide an optimal microenviroment for engraftment. Islets with purity over 90% were transplanted. A sentinel pouch was excised for evaluation 3 months after each transplant. Islet graft function was monitored based on glucose control, C-peptide and insulin usage.

Results: Early in the ongoing study, wound infection required SCP excision in one of six SCP implanted individuals. The two furthest advanced patients received two subsequent islet transplants into the SCPs resulting in persistent islet graft function (positive serum C-peptide). Peak serum C-peptide remains currently at a level of 0.4-0.48 ng/ml, at 6 and 3 months after the second transplant in first and second patient, respectively. Islet engraftment was 9-fold higher when the islet mass was reduced by half to 3,300IEQ/kg (0.8 ml of tissue) during the second transplant in both patients. In the first patient, glucose control improved as A1c decreased from 6.3 to 6.0, insulin requirements dropped by 23% and CGM Time Below Range (TBR) dropped from 12% to 5%. In the second patient A1c dropped from 10.3 to 7.6, insulin requirements dropped by 40% and Time Above Range dropped from 76% to 48%. None of the patients experienced severe hypoglycemic episodes after the second islet transplant. Of note, both patients lost initially 7-15% of body weight and maintained stable weight afterwards. Preserved islet anatomy and endocrine function were found on histopathological evaluation of the vascularized environment within excised sentinel pouches.

Conclusions: Modified conditions resulted in persistent islet graft function after SCP transplantation. Limiting islet mass to 3,000IEQ/kg per transplant significantly improved islet engraftment into Sernova Cell Pouches.

Abstract# 58

The Impact of Early Narcotic Administration on Intestinal Transplantation Survival at an Urban Medical Center

L. Maliekal[1], N. Beltran[2], Y. Muszkat[2], S. Nagai[2], S. Jafri[2], *[1]School of Medicine, Wayne State University School of Medicine, Detroit, MI, [2]Department of Gastroenterology, Henry Ford Hospital, Detroit, MI*

Purpose: The impact of early narcotic administration on intestinal transplant patients is not well understood, with current practice suggesting the avoidance of narcotics among transplant patients. We examine patient survival and early intestinal rejection among intestinal transplant patients who were administered narcotic pain medication post-transplant surgery at a single urban medical center.

Methods: A retrospective chart review was conducted for 26 intestinal transplant patients at a large urban medical center. The patients were separated into two groups: those who utilized narcotics up to six-months post-transplant, and those who did not. Trends in early intestinal rejection and patient survival were then noted among the two groups.

Results: Twenty-six patients were transplanted after undergoing intestinal failure. Three patient charts were excluded due to medical charting discrepancies; 23 patient charts were utilized for analysis. 30% of these patients were prescribed narcotics at six-months or earlier post-transplant surgery. The average age of these patients was 49.4 years, with 71.5% being female. These patients were transplanted due to various secondary causes including Crohn's disease, neuroendocrine carcinoma, and abdominal trauma. On the other hand, the average age of the non-narcotic group of patients was 51.6 years, with 62.5% being female. These patients underwent intestinal transplant for causes similar to the narcotics group, including Crohn's disease, neuroendocrine carcinoma, gunshot wound, complications from ruptured appendices, and visceral myopathy. 85.7% and 71.4% of patients who had received narcotics after transplant were alive 1 year and 5 years post-transplant, respectively. On the other hand, 93.8% and 75.0% of patients who did not receive narcotics were

alive 1 year and 5 years post-transplant, respectively. Of the patients who received narcotics, 28.6% of these patients also experienced acute intestinal rejection at 6-months or earlier post-transplant, whereas 43.8% of patients not receiving narcotics experienced acute intestinal rejection at 6-months or earlier post-transplant.
Conclusions: Variations in 1-year survival can be noted amongst transplant patients who are receiving narcotics and who are not receiving narcotics, whereas variations in 5-year survival does not seem to be as significant between these two groups. It would be worthwhile to further investigate the impacts of narcotics on intestinal transplant patient morbidity and mortality through large, multi-center studies to better standardize patient care.

COVID-19 in Kidney Recipients

Abstract# 59

COVID-19 in the Kidney Transplant Waitlist Population

A. C. Johnson[1], C. P. Larsen[1], H. Gebel[2], R. Bray[2], *[1]Surgery, Emory University, Atlanta, GA, [2]Pathology, Emory University, Atlanta, GA*
Purpose: Through banked serum samples from transplant candidates across Georgia, we characterize the prevalence, timing, and duration of SARS-CoV-2 seropositivity and investigate the impact on HLA alloantibodies.
Methods: We used a Luminex-based assay to detect antibodies against SARS-CoV-2. The assay is a semiquantitative measure of antibodies against Full Spike, S1, S2, Nucleocapsid and RBD epitopes as well as antibodies against 4 common coronaviruses, SARS-1, and MERS. We selected 400 waitlist candidates from Georgia counties with an above average case rate (>2200 cases per 100,000 people) as of August 2020 and screened the most recent serum sample from each candidate. For positive tests, we ran sequential historical samples to determine the earliest positive date and subsequently performed a geographic analysis of positive cases. Additionally, we cross-referenced SARS-CoV-2 reactivity with HLA antibody levels.
Results: Of 400 waitlist candidates, 33 tested positive for antibodies to SARS-CoV-2. Five of those candidates were positive on samples taken from as far back as 2019, pre-Covid. These samples also demonstrated high levels of binding to common coronavirus spike proteins. After removing these false positives (1.3%), there was a 7% test positivity rate. In counties with positive candidates, rates were approximately 10x higher than published by the GA department of public health. All 28 seropositive candidates maintained positive serology for the duration of the testing period (maximum of 5 months). Positive and negative groups had similar distributions of peritoneal and hemodialysis patients. In the 15 seropositive candidates with panel reactive antibodies (PRA), there was no apparent change associated with seroconversion.
Conclusions: Our analysis of transplant waitlist candidate SARS-CoV-2 serologies demonstrated a higher rate of positivity than that published by the state for the general population. This may be attributed to asymptomatic infections, insufficient testing, or an increased risk in this immune dysregulated population. While we intend to continue monitoring positive candidates to determine the duration of antibody presence, it is encouraging that candidates remained positive for the time studied. Finally, seroconversion does not appear to be a risk factor for the development of donor specific antibodies in this cohort of patients.

Predictors of Severe Covid-19 in Kidney Transplant Recipients in the First and Second Waves: Analysis of the Spanish Registry

M. Crespo[1], A. Mazuecos[2], I. Pérez-Flores[3], F. Moreso[4], A. Andrés[5], C. Jimenez[6], M. Molina[7], C. Canal[8], L. Sánchez-Cámara[9], S. Zárraga[10], M. Ruiz Fuentes[11], M. Aladrén[12], E. Melilli[13], V. López[14], E. Sanchez[15], J. Pascual for Spanish Nephro Society Covid-Registry[1], *[1]Nephrology, Hospital del Mar, Barcelona, Spain, [2]Nephrology, Hospital Puerta del Mar, Cadiz, Spain, [3]Nephrology, Hospital Clinico San Carlos, Madrid, Spain, [4]Nephrology, Hospital Valle Hebrón, Barcelona, Spain, [5]Nephrology, Hospital 12 Octubre, Madrid, Spain, [6]Nephrology, Hospital La Paz, Madrid, Spain, [7]Nephrology, Hospital Germans Trias i Pujol, Barcelona, Spain, [8]Nephrology, Fundacio Puigvert, Barcelona, Spain, [9]Nephrology, Hospital Gregorio Marañón, Madrid, Spain, [10]Nephrology, Hospital de Cruces, Bilbao, Spain, [11]Nephrology, Hospital Virgen de las Nieves, Granada, Spain, [12]Nephrology, Hospital Miguel Servet, Zaragoza, Spain, [13]Nephrology and Kidney Transplantation, Hospital de Bellvitge, Barcelona, Spain, [14]Nephrology, Hospital Regional de Málaga, Malaga, Spain, [15]Nephrology, Hospital de Cabueñes, Gijon, Spain*
Purpose: To better know the impact and characteristics of Covid-19 in renal patients, the Spanish Society of Nephrology set up a voluntary registry in March, 2020
Methods: Retrospective observational study of KT recipients included in the Spanish Covid-19 Registry (1st March to 14th November, 2020). We applied Cox multivariate analysis to identify risk factors for mortality and Kaplan-Meier and log rank survival analysis.
Results: 1080 KT with Covid-19 were registered, having 937 (86.1%) their outcome reported (cure or death). Most were men (63.2%), mean age 60 years infected a median of 72 months postransplantation. Death occurred in 204 patients. Multivariate analysis found age, neumonia and KT within the last 6 months before Covid-19 were risk factors for mortality and gastrointestinal symptoms were protective. Survival analysis showed significant increasing mortality risk in four subgroups: age<65 years&postransplant time> 6mo (n=526), age<65&time<6mo (n=49), age>65&time >6mo (n=325) and age>65&time<6mo (n=31)($$graphic). Of 1080 cases, 605 correspond to the first wave (1stW until June2020) and 475 to the second wave (2ndW). In the 2ndW, KT were younger (56.4 vs 61.1yr; p=.000), 15.8% were asymptomatic (p=.000) and presented less pneumonia (50.3% vs. 78%; p=.000). Fever, lymphopenia and respiratory symptoms were less frequent but gastrointestinal symptoms similar (30.9% vs. 34.2%; p=.256). Treatment has changed, with more use of remdesivir (p=.000) and steroids (p=.018), no use of ritonavir/lopinavir, hidroxycloroquine andazitromycin (p=.000), and no treatment in (37.1% vs 6.3% in 1stW, p=.000). Hospitalization decreased (89.2% vs. 63.2%; p=.000) but more KT were admitted to critical care units (14.5% vs 20%; p=.058). We found lower mortality (overall 26.4% vs 14.8%; p=.000, hospitalized 29% vs 23%; p=.088). Multivariate analysis of the 2ndW shows again that age, pneumonia and recent transplant (< 6 months) are mortality risk factors.
Conclusions: Over a thousand KT have suffered Covid-19 in Spain with a high mortality rate in the first and second waves, mainly related with age, pneumonia and recent transplantation. The interaction between age and time after transplant has to be considered when selecting recipients in the Covid-19 pandemic.

Suthanthiran[1], D. Dadhania[1], *[1]Nephrology, Weill Cornell-NYPresbyterian, New York, NY, [2]Transplant Surgery, Weill Cornell-NYPresbyterian, New York, NY, [3]Pathology, Weill Cornell-NY-Presbyterian, New York, NY*

Purpose: SARS-CoV-2 antibody prevalence in kidney transplant recipients is beginning to be reported, although little is known about the humoral immune response in the immediate post-transplant period when immunosuppressive therapy burden is highest and graft recipients are least likely to mount a robust immune response.

Methods: Patients transplanted from May 28, 2020 until October 1, 2020 (n=78) were followed prospectively. SARS-CoV-2 antibody testing was performed at the time of transplant. Semi-quantitative IgM and IgG data was collected on a subset of patients and followed both before and after transplant.

Results: At the time of kidney transplantation, SARS-CoV-2 antibody prevalence was 22%. Patient demographics are shown in Table 1. Of the patients with a positive antibody (n=17), 10 either had symptoms consistent with COVID-19 infection or had documented SARS-CoV-2 PCR positive testing prior to transplant. A total of 13 patients had follow-up antibody testing between 30 and 60 days post transplantation and 12 (92%) had persistent antibodies at the time of follow up. Figures 1A and B demonstrate box and whisker plots of the median and the 25th and 75th percentile values (bottom and top of each box, respectively), levels of IgM and IgG from the pre- and post-transplant period. Both SARS-CoV-2 IgM and IgG antibody levels declined in the post transplantation period but remained above the threshold for positivity (an index value of 1) despite induction therapy with ATG and the initiation of maintenance immunosuppression with CNI and MMF. To date, none of the 78 patients transplanted has manifested new or recurrent SARS-CoV-2 infection.

Conclusions: SARS-CoV-2 antibodies remain positive despite the high dose immunosuppression in the early post transplant period. Our data provide a framework for future prospective studies on the kinetics and isotype of SARS-CoV-2 antibody response and as an essential reference to gauge immune response following vaccination.

Abstract# 62

Characterizing Kidney Transplant Recipients with SARS-CoV-2: An Academic Single Center Experience

S. Nahi, A. Shetty, S. Tanna, J. Leventhal, *Northwestern University, Chicago, IL*

Purpose: Kidney transplant (KTx) recipients are a unique cohort in regard to SARS-CoV-2 susceptibility and clinical course, owing to their immunosuppressed state and propensity for kidney injury. This study investigated and characterized 53 SARS-CoV-2 positive KTx pts at Northwestern Memorial Hospital (NMH) in the first six months of the SARS-CoV-2 pandemic. We sought to identify risk factors and prognostic factors for severity of clinical disease, specific to this population.

Methods: This retrospective, single-center study included KTx recipients with a positive SARS-CoV-2 PCR at NMH from Jan. 1, 2020 to June 30, 2020. 53 pts met inclusion criteria. Clinical disease severity was ranked according to the WHO Ordinal Scale for SARS-CoV-2 Clinical Improvement, and the study population was divided into three groups based on disease severity {mild disease (ordinal scale of 0-2): n=11, moderate disease (ordinal scale of 3-4): n=29, severe disease (ordinal scale of 5-8): n=13}. We used a chi-squared analysis and a Welch's T-test to assess differences.

Results: Black American pts were overrepresented in the SARS-CoV 2 positive cohort, as compared to rates of KTx at NMH (p=0.025) (Figure 1). Hispanic pts were also overrepresented. In the total pt cohort, prevalence of risk factors are as follows: HTN (100%), diabetes (55%), obesity (42%),age ≥60 years) (34%), and heart disease (26%). The severe clinical disease cohort had statistically elevated rates of advanced age and diabetes. Proteinuria was identified in 42% of pts, significantly higher in the severe disease cohort as compared to mild disease (p=0.05). Enhanced immunosuppression (IS), defined by KTx or rejection episode in the last yr, was only present in 15% of cases, and not correlated with disease severity (Table 1). Fatality rate of this total pt cohort at 90 days post infection was 7.5%.

Conclusions: This single center experience reports disparity between the representation of racial minorities in the overall transplant pt group, and their representation in the SARS-CoV-2 infected transplant pt group (Figure 1). This finding is consistent with reports of overall of higher representation of Black Americans and Hispanic Americans in total SARS-CoV-2 cases and severity of illness. This study demonstrates risk factors previously correlated with severe disease do apply to the KTx recipient cohort as well. As a potential prognostic indicator of disease severity, these data support further investigation into the use of proteinuria. Importantly, this study reports no evidence of enhanced IS worsening clinical outcomes.

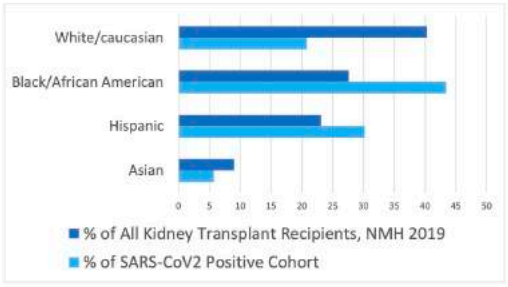

Figure 1. Racial discrepancies between NMH 2019 kidney transplant recipients and SARS-CoV2 positive kidney transplant recipients cohort.

Table 1. Characteristics of Kidney Transplant Recipients with SARS-CoV-2 at Presentation. (insignificant p values not reported).

Patient Characteristic	Mild Disease Cohort	Moderate Disease Cohort	Severe Disease Cohort	P value (a: mild vs. moderate; b: moderate vs. severe; c: mild vs. severe)
Advanced Age (>=60)	2 (18%)	8 (28%)	8 (62%)	0.04[b], 0.03[c]
HTN	11 (100%)	29 (100%)	13 (100%)

Abstract# 63

Prevalence and Dynamics of SARS-COV-2 IgG in Kidney Transplant Recipients

Y. Al Azzi, P. Loarte, C. Pynadath, O. Alani, L. Liriano-Ward, M. Ajaimy, R. Bartash, J. Graham, M. Le, H. Yaffe, S. Greenstein, J. Rocca, M. Kinkhabwala, E. Akalin, *Montefiore Medical Center, New York, NY*

Purpose: We aimed to investigate the prevalence and dynamics of SARS-CoV-2 IgG in kidney transplant recipients in the Bronx, New York, one of the epicenters of the pandemic

Methods: Between March 16 and November 30, 2020, 158 patients tested positive by SARS-CoV-2 RT-PCR. From May 3 to November 30, 2020, 1042 patients were screened for SARS-CoV-2 IgG antibodies and 164 (15.7%) were tested positive (Figure).

Results: Sixty of the 164 patients were previously diagnosed COVID-19 by RT-PCR, while the remaining 104 did not have significant symptoms and had not been previously tested by RT-PCR. Overall prevalence of COVID-19 diagnosis by RT-PCR and/or SARS-CoV-2 IgG in 1130 patients were 23.2%. Seventy RT-PCR positive patients were screened for SARS-CoV-2 IgG antibody at a median of 43 days post-diagnosis (IQR: 29-57) and 60 (85.7%) were positive. A total of 39 patients out 164 who previously tested positive for SARS-CoV-2 IgG (25 diagnosed with IgG and 14 with RT-PCR) were retested at a median time of 105 days (IQR: 83-116). Twenty patients (51.3%) became seronegative at a median time of 107 days (IQR: 87-134) from their first positive SARS-CoV-2 IgG. Six patients out of 14 (43%) who were diagnosed by positive RT-PCR became seronegative at a median time of 105 days (IQR: 83-166) from their first positive SARS-CoV-2 IgG while 14 patients out of 25 (56%) who were initially diagnosed by a positive SARS-CoV-2 IgG, became seronegative at a median time of 112 days (IQR: 91-138) from date of diagnosis

Conclusions: . In summary, 40% of kidney transplant recipients were asymptomatic or mildly symptomatic and developed SARS-CoV-2 IgG without requiring testing by SARS-CoV-2 RT-PCR. However, half of the patients who initially developed antibodies lost them over time raising the questions of lasting immunity against SARS-CoV-2 and how effective are those antibodies.

Abstract# 64

The Impact of Covid-19 in Kidney Transplant Recipients: A Systematic Review and Meta-analysis

J. Kumar[1], J. Pyda[2], I. Reccia[3], F. VIrdis[4], P. Bachul[1], R. Barth[1], Y. Becker[1], J. Fung[1], P. Witkowski[1], *[1]University of Chicago, Chicago, IL, [2]Beth Israel, Boston, MA, [3]Imperial College, London, United Kingdom, [4]Royal London, London, United Kingdom*

Purpose: To determine pooled prevalence of clinical outcomes among hospitalized kidney transplant recipients with COVID-19 through meta-analysis.

Methods: A systematic database search between Dec1, 2019- Dec1, 2020, revealed twenty-nine studies, 875 renal transplant patients with COVID-19.

Results: The most prevalent symptoms were fever(83%), cough(65%), dyspnea(46%) and gastrointestinal(27%). The frequently observed co-morbidities were hypertension(86%), DM2 (34%), and cardiac disease(26%)(Table1,2). In-hospital mortality was 23%(95%CI,17%-29%); while, it increased significantly in ICU admissions 58%(95%CI,43%-74%) (P≤0.001)(Fig1A,B). Further, sub-group analysis showed significantly increased mortality risk in elderly(OR=3.40); however, no such association was observed in terms of time since transplant and gender(Fig1C-E).

Conclusions: To recapitulate, we observed a higher prevalence of dyspnea and gastrointestinal symptoms to general population. In-hospital mortality was similar to non-transplant population with high co-morbidities alongside and considered as important determinants of increased critical care admission, invasive ventilatory requirement. In-addition, observed higher mortality in elderly could be because of age-associated comorbidities.

Table 1: Summary statistics outlined as pooled estimates of outcomes of interest.

Attribute	Events	Total	Studies	**Single group summary (95%CI)**
Age(yrs)	NA	829	28	57.14 (54.49 - 59.80)

Abstract# 65

Profile of SARS-CoV-2 Antibodies in Patients Awaiting Kidney Transplantation

L. Muir[1], A. Jaffer[2], C. Rees-Spear[1], V. Gopalan[2], F. Chang[2], G. Vaitkute[1], R. Fernando[3], C. Roustan[4], A. Rosa[4], C. Earl[4], A. Salama[2], P. Cherepanov[4], L. E. McCoy[1], R. Motallebzadeh[2], *[1]Institute of Immunity & Transplantation, University College London, London, United Kingdom, [2]Nephrology & Transplantation, Royal Free London Hospital NHS Trust, London, United Kingdom, [3]Anthony Nolan Institute, Royal Free London Hospital NHS Trust, London, United Kingdom, [4]The Francis Crick Institute, London, United Kingdom*

Purpose: Patients with end-stage kidney disease (ESKD) represent an extremely vulnerable group with many risk factors for adverse outcomes following SARS-CoV-2 infection. Key questions pertaining to ESKD patients awaiting transplantation include quantifying the rates of symptomatic & asymptomatic infection and determining if seroconverted patients have functional neutralising activity against SARS-CoV-2. The study of the immunological characteristics of COVID-19 in ESKD patients may help the design of an effective vaccination strategy against SARS-CoV-2 for potential transplant recipients.

Methods: Serum samples were analysed by direct ELISA to detect anti-SARS-CoV-2 IgG antibodies using a recombinant Spike $S1_{1-530}$ subunit and Nucleocapsid protein (NP). Recombinant human anti-SARS-CoV-2 mAbs that bind to spike RBD and NP were used as positive controls. Neutralization potency against SARS-CoV-2 was measured using HIV-1 luciferase-based pseudotype assays. Titres of neutralising antibodies were calculated as 50% inhibitory dose (ID50), expressed as the highest dilution of plasma which resulted in 50% reduction of luciferase luminescence compared with controls.

Results: 217 patients were on our wait-list as of May 2020 (115 receiving in-centre haemodialysis [ICHD], 41 on peritoneal dialysis and 61 pre-dialysis). 164 serum samples, of which 76% were obtained by June 2020 and coincided with the first peak of the pandemic in UK, were analysed. The observed seroprevalence of SARS-CoV-2 antibodies was 36% (95% CI 32-46). Seroconverted patients were more frail (median Clinical Frailty Scale score 3 [IQR: 3-4] vs 3 [IQR: 2-3]; p=0.02), mostly from BAME background (76.3% vs 52.4%, p=0.04), had higher prevalence of diabetes (27.1% vs 12.4%; p=0.02), and received ICHD (84.7% vs 60%; p=0.006). Levels of anti-S1 and anti-NP SARS-CoV-2 IgG strongly correlated with ID50 (r=0.58, p<0.0001 and r=0.41, p=0.004, respectively). Peak CRP levels were correlated with ID50 (r=0.30; p=0.05). There were significant declines of S1 and NP antibody titres as well as neutralising activity by a median of 90 days.

Conclusions: Analysis of SARS-CoV-2 antibodies and neutralising activity suggest robust functional responses are produced in infected ESKD patients, but titres wane significantly by 3 months. The level of functional immunity to SARS-CoV-2 in patients with ESKD may be used to risk stratify patients on national waiting-lists for renal transplantation and will help evaluate the efficacy of vaccination schedules in wait-listed patients once this becomes available.

Abstract# 66

Modification in Immunosuppression Regimens to Safely Perform Kidney Transplants Amid the Covid-19 Pandemic

L. Von Stein, O. Witkowsky, L. Samidurai, K. Flores, M. Doraiswamy, T. Pesavento, P. Singh, *The Ohio State University Wexner Medical Center, Columbus, OH*

Purpose: In the USA, there was a 51.1% reduction in kidney transplant (KTx) since March 2020 due to concerns for contraction of COVID-19 in transplant recipients. In our center, cumulative doses of ATG induction were reduced from 4-6mg/kg to 2-4 mg/kg in immunological high risk [HR] [age < 55 years, AA, cPRA > 20%, 2 DR mismatch, KP, retransplant], from ATG 2-4 mg/kg to 1-2 mg/kg in moderate-risk [MR] [age > 55 years, non-AA, CPRA <20% and <2 DR mismatch) and from ATG 0-2mg/kg to basiliximab for low risk [LR] patients [LDKT, age >65 years, cPRA < 20%, with 0 to 1 DR mismatch]. We used Tacrolimus and Myfortic as a maintenance agent and continued with a five-day rapid steroid withdrawal. This study assessed the effect of these changes on our transplant outcomes.

Methods: We conducted a retrospective chart review of all adults with KTx or KP from 3/1/2020 to 8/31/2020 with a follow-up of at least two months. Primary outcomes included the incidence of biopsy-proven rejection (BPAR), de-novo DSA, delayed graft function (DGF), infection rate, graft loss, and all causes of mortality.

Results: 180 KTx and 5 KP were reviewed with a median follow-up of 161 days [66, 250]. 13% were LDKT, and 11% retransplant. Median recipient age was 55 years [21, 78], and 28% were > 65 years old. 64% were white, and 63% were male. 46% of organs were PHS high-risk, median KDPI was 49 [2, 96], CIT 12 hours (2, 47).

Median donor creatinine was 1.3mg/dL (0.2, 7.15). 62% HR received ATG of 3-4mg/kg, 8% MR received 1-2mg/kg, and 30% LR received basiliximab. Creatinine nadir was 1.35mg/dL (0.52, 3.57). DGF was similar to the national average at 23%. 5% developed new DSA [MFI>2000]. Three patients had Banff 1a rejection. Patient 1 received basiliximab (LR) but likely rejected due to IS reduction during his COVID illness. Patients 2 and 3 both received ATG [HR] and were treated with increased IS and steroids. All three responded well to treatment. Three patients were diagnosed with COVID-19 and responded well to remdesivir, dexamethasone, and convalescent plasma. The median time of diagnosis from transplant was 90 days [12, 210], and the recent creatinine was 1.5mg/dL [1.2, 2.42]. 19% of CMV PCR (+) required dose reductions of IS, while 30% required CMV treatment. BK PCR of >10,000 was noted in 5.4% patients. Two graft losses occurred within a week of transplant secondary to the renal vein thrombosis. No mortality was noted.

Conclusions: With careful monitoring and reduction in induction immunosuppression, KT and KP transplants could be performed safely during the COVID pandemic.

Abstract# 67

Cognition After Belatacept Conversion (CAB) Trial

W. Asch[1], K. Belfield[2], V. Do[2], E. Cohen[1], *[1]Yale University, New Haven, CT, [2]Yale New Haven Hospital, New Haven, CT*

Purpose: Extensive adverse effect profiles including neurotoxicity, manifesting as short-term memory loss, make CNIs less desirable despite their efficacy preventing acute rejection and increasing graft and patient survival. The increased risk for neurocognitive dysfunction induced by CNIs has been long recognized, but not well characterized by formal neurocognitive assessment. Furthermore, to what extent neurocognitive improvement occurs after CNI discontinuation is even less well known. Unlike improvements in renal function, which have an objective laboratory measure, improvements in neurocognition require more complex assessment to quantify.

Methods: Traditional cognitive assessment instruments are time intensive, costly, and ideally are administered by a formally trained assessor. The NIH Toolbox Cognition Battery (NIHTB-CB) offers many of the advantages of a traditional assessment, but via a semi-automated computer program administered on an iPad platform. Testing takes less than 45 minutes to administer and our team rapidly mastered the testing procedure and software interface. We performed a pilot study using the NIHTB-CB to measure neurocognitive function in 20 patients converted from tacrolimus to belatacept immunosuppression. A test-retest study design was utilized whereby patients were assessed prior to conversion to belatacept and retested within 6 months following discontinuation of tacrolimus.

Results: Patients experienced a statistically significant improvement in raw test scores for: Attention & Executive Function, Episodic Memory, Processing Speed, and the Cognition Fluid Composite Scores. A trend toward an improvement in Working Memory was also seen but did not achieve statistical significance. Executive Function did not show any changes following conversion (see Table). Scores remained on average below the general population mean even after normalizing for age, educational level, ethnicity, and sex.

Conclusions: Our pilot study assessing Cognition after Belatacept conversion substantiates the patient reported perception that cognitive function is mildly impaired on tacrolimus and demonstrates that recovery of this impairment is possible following conversion to belatacept. Furthermore, this pilot study confirms that neurocognitive assessment can be performed by transplant clinicians in the clinic setting using the NIHTB-CB testing platform.

Construct	Raw Score Improvement (%)	Effect Size: (μ1-μ0)/SD	p-value
Attention Executive Functioning	7%	0.67	0.004
Episodic Memory	9%	0.54	0.03
Working Memory	5%	0.41	0.09
Executive Function	0%	0.12	0.86
Processing Speed	11%	0.58	0.01
Cognition Fluid Composite	9%	1.01	0.0005

Abstract# 68

Insulin Secretion and Insulin Resistance Trajectories Over 1 Year After Kidney Transplantation: A Multicenter Prospective Cohort Study

B. Jun Bae, C. Oh, *Department of Surgery, Ajou University Medical School, Suwon, Korea, Republic of*

Purpose: We investigated the changing patterns of insulin secretion and resistance and risk factors contributing to the development of post-transplant diabetes mellitus (PTDM) in kidney recipients under tacrolimus-based immunosuppression regimen during 1 year after transplantation.

Methods: This was a multicenter prospective cohort study. Of the 168 subjects enrolled in this study, we analyzed a total 87 kidney transplant recipients without diabetes which was assessed by oral glucose tolerance test before transplantation. We evaluated the incidence of PTDM and followed up the index of insulin secretion (insulinogenic index [IGI]) and resistance (homeostatic model assessment for insulin resistance [HOMA-IR]) at 3, 6, 9 months, and 1 year after transplantation by oral glucose tolerance test and diabetes treatment. We also assessed the risk factors for incident PTDM.

Results: PTDM developed in 23 of 87 subjects (26.4%) during 1 year after transplantation. More than half of total PTDM (56.5%) occurred in the first 3 months after transplantation. During 1 year after transplantation, insulin resistance (HOMA-IR) was increased in both PTDM and no PTDM group. In no PTDM group, the increase in insulin secretory function to overcome insulin resistance was also observed. However, PTDM group showed no increase in insulin secretion function (IGI). Old age, status of prediabetes and episode of acute rejection were significantly associated with the development of PTDM

Conclusions: In tacrolimus-based immunosuppressive drugs regimen, impaired insulin secretory function for reduced insulin sensitivity contributed to the development of PTDM than insulin resistance during 1 year after transplantation

Abstract# 69

The Impact of 4-weeks of Supervised Exercise on Frailty and Lower Extremity (LE) Function in Patients with Advanced Chronic Kidney Disease (CKD)

E. Lorenz, L. Hickson, R. Weatherly, K. Thompson, M. Hogan, C. Kennedy, *Mayo Clinic, Rochester, MN*

Purpose: Although frailty is a modifiable risk factor for morbidity and mortality among kidney transplant (KT) candidates, the optimal duration of effective prehabilitation interventions is unknown. We have previously shown that 8-weeks of supervised exercise is associated with improved frailty parameters, quality of life (QOL), and LE function in patients with advanced CKD, including KT candidates. The objective of this study was to examine whether only 4-weeks of supervised exercise is also associated with improved frailty parameters, QOL, and LE function.
Methods: We conducted a prospective, pilot study between 7/2018 and 5/2020 involving adults with ≥ stage 4 CKD who were 1) frail or pre-frail by Fried phenotype and/or 2) had a Short Physical Performance Battery (SPPB) score ≤ 10. Quality of life was measured using the Kidney Disease Quality of Life (KDQOL) survey. The intervention consisted of 4-weeks of twice weekly supervised exercise sessions (8 sessions) in our pulmonary rehabilitation unit. Pre- and post-intervention comparisons were made using Wilcoxon signed-rank test for continuous variables and McNemar's test for categorical variables.
Results: We enrolled 35 participants of whom 27 (77%) completed the intervention. We excluded two participants whose intervention was interrupted by the COVID-19 pandemic. Of the remaining 25 participants, median age was 62 (range 40-87) years, 56% were male, 64% were on dialysis, and 84% had been evaluated for KT. Following the intervention, 67% of participants who were frail at baseline improved their frailty score (n=6/9). No improvement in grip strength was observed. However, multiple other parameters improved significantly, including fatigue, walking time, balance scores, and chair stand scores.

Outcomes at baseline compared to 4-weeks				
Outcome	Baseline	After 4-weeks	Median difference	p-value
Wasting	32.0% (n=8/25)	24.0% (n=6/25)		0.32
Fatigue (per KDQOL)	42.5 [0 to 75.0]	50.0 [20.0 to 70.0]	5.0 [-15.0 to 50.0]	0.02
Low physical activity	36.0% (n=9/25)	16.0% (n=4/25)		0.06
Walking time (s)	5.1 [3.4 to 8.5]	4.1 [2.5-5.5]	-1.1 [-3.9 to 0.7]	<0.0001
Grip strength (kg)	24.5 [9.8 to 80.6]	23.1 [11.6 to 89.8]	0.7 [-7.6 to 10.5]	0.59
Balance score	3 [1 to 4]	4 [1 to 4]	0 [-1 to 2]	0.05
Chair stand score	1 [0 to 4]	2 [0 to 4]	0 [-2 to 2]	0.04

Conclusions: Our pilot study suggests that 4-weeks of supervised exercise is associated with improved fatigue, walking time, balance scores, and chair stand scores among patients with advanced CKD. Longer interventions, however, may be required to modify grip strength. This study provides important preliminary data for future studies aimed at designing effective prehabilitation strategies prior to KT.

Abstract# 70

Growth Differentiation Factor 15 Predictor Value is Superior to Troponin I in the Evaluation of Kidney Transplant Candidates

M. de Cos Gomez[1], M. Garcia Unzueta[2], A. Benito Hernandez[1], J. Mazon Ruiz[1], M. Perez Arnedo[1], A. Aguilera Fernandez[1], R. Valero San Cecilio[1], J. Ruiz San Millan[1], E. Rodrigo Calabia[1], *[1]Nephrology, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain, [2]Clinical Analysis, Marques de Valdecilla University Hospital - IDIVAL, Santander, Spain*

Purpose: Pretransplant cardiac troponin I (cTNI) has demonstrated its predictor value of survival after kidney transplant in previous studies. Growth differentiation factor 15 (GDF-15) is a biomarker currently studied as a predictor of mortality and cardiovascular events (CVE) in multiple scenarios. The aim of this study is to compare the utility of cTNI and GDF-15 to predict posttransplant mortality and CVE in a cohort of kidney transplant recipients.
Methods: We included 359 kidney transplants performed between 2005 and 2015. cTNI and GDF-15 were measured on stored serum samples obtained pretransplant. Information about patients was extracted from the prospectively maintained database of renal transplant recipients at our center.
Results: Receptors had a median age of 54.1 and were 67.4% male. 22% were diabetic before the transplant, whereas 9.5% and 8.1% had prior history of coronary and peripheral artery disease respectively. 16.5% transplants were performed preemptively. Median GDF-15 was 5346.4 (R=50.5-18607.3) pg/ml and median cTNI was 5.6 (R=2.5-691.4) ng/l. Patients were stratified in tertiles according to GDF-15 and cTNT levels. In the univariate analysis, higher levels of GDF-15 significantly related to overall mortality, stroke, acute coronary syndrome and major adverse cardiovascular events (MACE). Higher cTNI related to cardiovascular mortality, acute coronary syndrome and MACE, but not overall mortality (Log Rank p=0.4). By multivariate cox analysis, including both biomarkers and clinical characteristics (age, diabetes, prior coronary and peripheral artery disease and pretransplant renal replacement therapy), the relation between survival and GDF-15 remained significant for the highest tertile (HR 2.2 CI95% (1.2-4.1), p = 0.01). GDF-15 relation with cerebrovascular accidents and MACE remained significant after the adjustment by clinical characteristics [HR 9.7 CI95% (2.2-43.1), p = 0.003 and HR 2.7 CI95% (1.4-5.1), p = 0.002] for the highest risk tertile. On the contrary, posttransplant acute coronary syndrome was only related to cTNI tertiles and previous coronary artery disease in the multivariate model [HR 3.2 CI95% (1.5-7.3), p = 0.003 for the highest cTNI tertile].
Conclusions: Our study highlights the potential utility of GDF-15 as a predictor of mortality and cardiovascular adverse events after transplant. By contrast, cardiac troponin was only related to acute coronary events, probably due to its specific production in myocardial tissue. Altogether, these two molecules could have high clinical potential in conjunction with clinical characteristics to better predict adverse events after kidney transplantation and find strategies to prevent them.

Abstract# 71

Intensive Blood Pressure Control Preserves Kidney Allograft Function

K. A. Agarwal[1], U. K. Agarwal[2], G. S. Silva[3], K. J. Pollick[3], M. Pavlakis[1], *[1]Transplant Institute, Beth Israel Deaconess Medical Center, Boston, MA, [2]Biostatistics consultant, Boston, MA, [3]Beth Israel Deaconess Medical Center, Boston, MA*

Purpose: Kidney transplant recipients (KTRs) are at higher risk of major adverse cardiovascular events compared to the general population, with HTN being a crucial risk factor. BP targets for KTRs remain elusive. The 2009 KDIGO target of SBP<130 was based on studies in CKD population. The SPRINT trial, adopted by AHA, showed lower mortality with an intensive SBP goal (<130). We studied the effect of intensive BP control in KTRs.
Methods: This retrospective cohort analysis included adult KTRs performed between 1/1/2002-12/31/2015 at a single academic center. BP, serum creatinine and urine protein-creatinine ratio (UPCR) were followed at 3-month intervals for 5 years after kidney transplant. Patients were divided into 3 groups based on their mean SBP (mmHg): <=120, 121-130 and >130. eGFR was calculated at 12 and 60 months using the MDRD equation. Primary outcomes were patient survival, graft survival and an eGFR decline of 25% or greater in the 5 years of follow up. Graft failure was defined as new diagnosis of ESRD post-transplant. Comparison of categorical variables was done using Pearson Chi^2 test and continuous variables using Kruskal Wallis H test. Patient and graft survival were studied using Kaplan Meier survival analysis.
Results: Table 1 & 2. Patients with mean SBP 121-130 had better patient and graft survival (Fig 1). Higher proportion of patients with SBP>130 suffered a decline of 25% or greater in their GFR and had a UPCR>1g/g during the 5-year follow-up as compared to those with SBP<=130 (Table 2).
Conclusions: In this cohort, most patients had average SBP>130. We show that a SBP of 121-130 mmHg is associated with improved patient and graft survival compared both to higher (>130) or lower (<=120) mean values as well as slower decline of renal allograft function.

Table 1: Baseline characteristics

	Total (n=473)	SBP<=120 (n=73)	SBP 121-130 (n=122)	SBP>130 (n=278)	p-value
Males	295 (62.4%)	33 (45.2%)	75 (61.5%)	187 (67.3%)	0.002
Age in years (mean, min-max)	52.9 (23-82)	47.7 (29-69)	51.8 (23-82)	54.9 (25-78)	0.0001
Mean SBP (mmHg)	134 +/- 13.9	113.7 +/- 5.7	125.7 +/- 2.7	142.9 +/- 9.9	0.0001
Mean DBP (mmHg)	76.6 +/- 9.7	72.3 +/- 5.9	74.9 +/- 8.0	78.5 +/- 10.6	0.0001
Mean eGFR at 12mo (mL/min)	51.5 +/- 18.4	55.3 +/- 20.3	53.9 +/- 18.6	49.5 +/- 17.5	0.0065
Mean eGFR at 60mo (mL/min)	51.8 +/- 21.5	55.5 +/- 20.8	54.8 +/- 20.9	49.4 +/- 21.7	0.014

Table 2: Outcomes.

Abstract# 72

Outcomes of Kidney Transplantation in Patients with Prosthetic Heart Valves

H. Ouahmi, *Nephrology, Dialysis, Transplantation, Nice University Hospital, Nice, France*

Purpose: Due to the aging of the population, a growing number of patients with end-stage kidney disease (ESKD) require cardiac valve replacement. As a consequence, the number of kidney transplant candidates with prosthetic heart valves (PHVs) is increasing. Yet, outcomes of kidney transplantation in these patients are unknown. We provide the first report of post-transplant outcomes in patients with prosthetic heart valves at time of kidney transplantation.
Methods: We conducted a matched cohort study among kidney transplant recipients from the French multicentric and prospective DIVAT cohort. We compared post-transplant outcomes in patients with left-sided PHVs at time of kidney transplantation (2000-2019) and a population of recipients without PHV matched for re-transplant dialysis time, recurrent renal disease, diabetes, cardiovascular events and pre-transplant donor-specific antibodies. Cox proportional hazards regression was used to identify independent predictors of death.
Results: Of 23018 kidney transplant recipients in the database, 368 were included in the study, 92 (0.4%) of whom had a PHV at time of transplantation and 276 had not. Delayed graft function and post-operative bleeding occurred more frequently in patients with PHVs than in those without PHV (34.8% vs 14.1%, p<0.0001 and 47.8% vs 11.6 %, p<0.0001, respectively). Kidney graft survival was similar between groups. 5-year overall survival was 68.5 % in patients with PHV versus 87.9 % in patients without PHV (HR, 2.72 [1.57-4.70], p=0.0004 by log-rank). Deaths from infection, endocarditis and bleeding were significantly more frequent in patients with PHV (14.1% vs 4.7%, p=0.004; 3.2% vs 0.4%, p=0.049; 3.3% vs 0%, p=0.02; respectively). In contrast with a bioprosthetic valve, a mechanical valve at time of transplantation was an independent risk factor for mortality (HR, 2.89 [1.68-4.97], p=0.0001) together with recipient age, pre-transplant dialysis time, diabetes and cardiac events.
Conclusions: ESKD patients with prosthetic heart valves have high mortality rates after kidney transplantation (more than 30% at 5 years post-transplantation). These data suggest that mechanical valves, but not biological valves, increase risks of post-transplant mortality, which has to be considered when choosing the type of prosthetic heart valve in ESKD patients eligible for kidney transplantation.

Abstract# 73

Correlation of Coronary Anatomy and Interventions with Post-kidney Transplantation Outcomes

A. Sharma, T. Teigeler, D. Kumar, S. Moldowan, C. Bhati, G. Gupta, L. Kang, M. Levy, *Virginia Commonwealth University, Richmond, VA*

Purpose: There is considerable variation in the preoperative coronary evaluation before kidney transplantation (KT) and subsequent reporting of outcomes.
Methods: Patients who received a KT (from 05/2009 to 05/2018) at our center, as well as a cardiac catheterization within the preceding five years were studied. The *primary outcome* was defined as a postoperative composite adverse event of acute myocardial infarction (MI), urgent revascularization, new reduction in left ventricular ejection fraction (LVEF), peri-operative hemodynamic instability, and 30-day patient death or graft loss. Long-term patient and graft survival were followed.
Results: 484 KT recipients were divided into four groups based on coronary anatomy : no coronary disease (n=96), mild disease without obstruction (n=229), obstructive disease with revascularization (n=110), and obstructive disease without complete revascularization (n=49). There was no significant difference in the composite adverse events between the groups (21%, 28%, 30%, and 24%, respectively;

p=0.46). There was significant difference in patient survival between the four groups (Figure 1) but no significant difference in graft survival was observed (Figure 2). In multivariable regression analyses, coronary anatomy groups were not significantly associated with the primary outcome. Recipient age at transplant (OR=1.71, p=0.03) and history of severe valvular dysfunction (OR=10.53, p=0.02) were significantly associated with composite early adverse events. Recipient age at transplant, history of diabetes and LVEF significantly impacted patient survival, regardless of the coronary anatomy. History of MI was the only factor that significantly increased the risk of graft failure (HR=3.57, p=0.02), regardless of the way coronary anatomy was grouped.
Conclusions: Pre-transplant coronary interventions may result in good short-term outcomes but long-term patient survival after KT may still be adversely affected by CAD. Advanced age and severe valvular dysfunction may predict adverse events early after KT. There is a need to develop post-transplant protocols for monitoring recurrent or new onset CAD in KT recipients.

Abstract# 74

Kidney Transplant Recipients Who Had Covid-19 Prior to Transplant: A Single-center Experience

S. Sultan, M. Aull, R. Craig-Schapiro, E. C. Liu, J. H. Lee, S. Kapur, *New York Presbyterian / Weill Cornell, New York, NY*

Purpose: In the early recovery phase after the initial surge of the COVID-19 pandemic, a question emerged in the context of resuming transplant activity: should a patient who had recovered from COVID-19 be eligible for transplant, and under what conditions? Here we report our early experience of patients who had recovered from COVID-19 and then subsequently underwent kidney transplantation.
Methods: Patients who were known to have COVID-19 were required to be fully asymptomatic and to have a negative PCR test prior to being eligible to undergo transplant, but no specific waiting period was required. A retrospective chart review was performed on patients who underwent transplant between 6/3/2020 and 7/30/2020, allowing for at least 3 months of post-transplant follow-up. During this period we adjusted our protocol to reduce the total dose of anti-thymocyte globulin for induction, from a historical dose of 6 mg/kg, now to 4.5mg/kg in three divided doses, while the maintenance immunosuppression was unchanged.
Results: In the study period, there were 10 patients who were known to have had COVID-19, by a PCR test, who then underwent kidney transplant. The average duration between the first COVID test and the date of transplant was 97 days (range 47 - 137). All patients demonstrated the presence of antibodies, at a mean duration of 96 days (range 32 - 164) after the PCR test. There were 8 males and 2 females. The average age at the time of transplant was 51.3 years (range 31.0 - 68.7). There were 7 living donors and 3 deceased donors. There were no episodes of respiratory failure and no deaths. There were no cases of biopsy-proven acute rejection, or graft thrombosis. There was 1 case of recurrent FSGS, which was treated. There was 1 graft loss relating to a severe neurologic decompensation of unclear etiology and the resulting inability to tolerate immunosuppression. This patient had a positive PCR test 42 days post-transplant, but other PCR tests before and after that point were negative. In the remaining 9 cases with functioning grafts, the average Cr at 3 months of follow-up was 1.71 mg/dL (range 1.1 - 3.89).
Conclusions: In this small series with short-term follow-up, outcomes of patients who previously had COVID-19 and then underwent kidney transplant were generally good. However, caution is still advised until larger experiences and longer-term data are published.

Pediatric Kidney

Abstract# 75

Racial and Ethnic Disparities in Pediatric Kidney Transplantation - Has KAS Made a Difference?

O. Charnaya[1], S. Yu[2], A. Goldberg[3], J. Garonzik-Wang[2], D. Segev[2], P. Verghese[4], *[1]Pediatrics, Johns Hopkins University, Baltimore, MD, [2]Transplant Surgery, Johns Hopkins University, Baltimore, MD, [3]University of Manitoba, Winninpeg, MB, Canada, [4]Northwestern University Feinberg School of Medicine, Chicago, IL*

Purpose: Racial and ethnic minority pediatric transplant candidates have known disparities in access to kidney transplantation. The Kidney Allocation System (KAS), implemented in 2014, was designed in part to alleviate some of these disparities thereby making transplant more equitable. We investigated the effect of KAS on reported disparities.
Methods: We utilized Scientific Registry of Transplant Recipients (SRTR) data to determine differences in new waitlist registrants, deceased donor (DDKT) and living donor kidney transplants (LDKT), HLA mismatch, and allograft survival among pediatric patients of different racial and ethnic backgrounds.
Results: Black pediatric patients represented 21.3% of new waitlist registrants pre-KAS and 18.9% post-KAS. Waitlist time increased for pediatric patients of all races post-KAS with the highest increase (131 days) in Asian patients ($p < 0.01$). The racial distribution of DDKT pre- and post-KAS was unchanged (White 38.4% vs 38.3%, Black 24.5% vs 22.5%, Hispanic 30.6% vs 31.1%, Asian 3.7% vs 4.4%, $p = 0.12$). Similarly, LDKT racial distribution pre- and post-KAS did not differ (White 68.9% vs 68.7%, Black 8.7% vs 9.3%, Hispanic 16.8% vs 16.9%, Asian 3.5% vs 3.2%, $p = 0.97$) and still occurs less frequently in Black and Asian patients. The 3-yr graft failure rate is disproportionately worse in Black children compared to other races pre- and post-KAS (White 6.8% vs 5.3%, Black 14% vs 8.7%, Hispanic 8% vs 4.5%, Asian 6.6% vs 6.7%, Other 6.5% vs 2.9%) although there is a trend towards better graft survival in the post-KAS era. Graft survival worsened in Asian children in the post-KAS era ($HR_{1.05}2.34_{5.25}$, p=0.038).
Conclusions: Racial and ethnic disparities in pediatric ESRD patients have not been ameliorated by KAS. Children of color have longer waitlist time and are more likely to have graft failure. Alarmingly, allograft failure rate increased in Asian patients post-KAS, which merits further evaluation.

Table 1: Demographic data and univariate analysis by race in pre-KAS (2010-2014) and post-KAS (2015-2019) eras among pediatric KT patients.

		Time Eras		
		2010 - 2014	2015 - 2019	p-value

Abstract# 76

Hla Antigens and Recurrence of Focal Segmental Glomerulosclerosis in Pediatric Kidney Transplantation

B. I. Shaw[1], A. Ochoa[2], C. Chan[2], R. A. Gbadegesin[3], A. M. Jackson[1], E. T. Chambers[3], *[1]Surgery, Duke University, Durham, NC, [2]Biostatistics and Bioinformatics, Duke University, Durham, NC, [3]Pediatrics, Duke University, Durham, NC*

Purpose: Recurrence of focal segmental glomerulosclerosis (FSGS) reduces graft survival yet risk factors remain elusive. While HLA risk alleles are known to be associated with primary nephrotic syndrome, we sought to determine the role of HLA in post-transplant recurrence.

Methods: Kidney transplant recipients under 19 years old diagnosed with FSGS were obtained from the Scientific Registry of Transplant Recipients. Simple logistic regression was performed to relate recipient HLA antigen and recurrence. The false discovery rate was controlled using the Benjamini-Hochberg method. For recipient HLA antigens associated with recurrence, we also examined the association of donor HLA and concordance between donor and recipient HLA and recurrence. Multiple logistic regression including HLA and clinical characteristics was performed to predict recurrence.

Results: Recipients who recurred were younger and had lower albumin; no association between deceased or living donor type and recurrence was seen (**Table 1**). Recipient HLA antigens B13, DR7, DR53, and DQ2 were associated with increased recurrence while DQ7, DQ6, DR52, B58 and C3 were associated with decreased recurrence (**Figure 1A**). HLA-DR7, DQ2, and DR53 presented as co-linear variables and represented a potential risk phenotype for recurrence (OR 1.92 95% CI [1.44-2.50]). This risk phenotype was associated with a shorter recurrence free survival (**Figure 1B**, Logrank p<0.0001). Donor organs with the risk phenotype did not significantly increase risk of recurrence, even in cases where recipient and donor both possessed the risk phenotype. DQ7 concordance between donor and recipient was associated with decreased recurrence (OR 0.36 95% CI [0.22-0.59]). Our multivariable model had moderate predictive value (c-statistic 0.67).

Conclusions: Certain HLA antigens were found to associate with either increased or decreased risk of recurrent FSGS post-transplantation. Validation of HLA risk alleles could impact risk assessment and donor selection in this population.

Abstract# 77

Kidney Paired Donation in Pediatrics: An Underused Opportunity?

J. Smith[1], M. Skeans[2], R. Engen[3], S. Bartosh[4], *[1]Seattle Children's Hospital, Seattle, WA, [2]SRTR, Minneapolis, MN, [3]Lurie Children's Hospital, Chicago, IL, [4]Univ of Wisconsin, Madison, WI*

Purpose: Kidney paired donation (KPD) provides the opportunity for ABO-mismatched or HLA-incompatible pairs to receive a living donor kidney transplant. The superior graft survival among living donor kidney recipients is of particular importance in the pediatric population, who will likely require multiple transplants in their lifetime. KPD represents a potential strategy to increase living donation in this population. While the use of KPD in adults in increasingly common, its use in the pediatric population is not well described.
Methods: We used SRTR data to describe the population of pediatric living donor transplant recipients, 2014-2019, by KPD status. Chi-squared tests for difference by KPD status were performed. We compared the proportion of pediatric and adult KPD recipients during the same interval.
Results: The number of pediatric recipients of KPD kidneys is small but increased from 8 (3.3% of living donor recipients) in 2014 to 18 (7.5%) in 2019, with a peak of 25 (9.1%) in 2018. KPD use is higher in adults and has been growing steadily since 2014 (Figure 1). Characteristics more common to pediatric KPD recipients than to other pediatric living donor recipients were Black race (18.0% vs. 8.3%), previous transplant (15.7% vs. 6.5%), panel reactive antibodies >20% (33.7% vs. 13.8%), and donor <10 years older than the recipient (6.7% vs. 2.7%) (Table 1).
Conclusions: Participation in KPD programs presents logistical and financial challenges for pediatric kidney programs, but an increasing number have been performed in recent years. This program could provide increased transplant opportunities for pediatric recipients, especially for disadvantaged groups.

Abstract# 78

Drivers of Graft Failure in Pediatric Kidney Transplant Change Over Time

E. Benz[1], D. Schaubel[2], S. Amaral[1], *[1]Children's Hospital of Philadelphia, Philadelphia, PA, [2]Department of Biostatistics, Epidemiology, and Informatics, University of Pennsylvania, Philadelphia, PA*

Purpose: Short-term pediatric kidney transplant outcomes have improved over time with advanced surgical techniques and better immunosuppression, but long-term graft outcomes remain suboptimal - concerning for children who need multiple transplants over a lifetime. To target interventions, better understanding of contributors to positive and negative long-term outcomes are needed. We investigated whether induction choice was associated with graft outcomes over time. We also examined how donor and recipient characteristics impact short vs long-term outcomes.
Methods: Using SRTR, we analyzed incident kidney transplant recipients in the U.S. < 21 years of age transplanted from 2002-2019. Choice of a single induction agent (IL2-ra, T-cell depleting, or steroids only) was our primary exposure with all-cause graft failure as the outcome at different time intervals (1, 3, 5, 10 and 15 years post-transplant). Multivariable cox proportional hazard models looked at adjusted hazard ratios of different drivers of graft failure at these intervals. Models were adjusted for age, gender, race, etiology of ESKD, insurance status, pre-emptive transplant, maintenance therapy, donor type, donor age, HLA mismatches, transplant center volume and transplant year.
Results: T-cell depleting therapy (vs. IL2-ra) was not associated with graft failure at any post-transplant time interval. Initial maintenance therapy with Tacrolimus + anti-metabolite without steroids (vs. with steroids) did not show increased hazard of graft failure across time. Increased donor HLA mismatches were associated with worse long-term outcomes. Younger age (<6 yrs vs. 6-10 yrs) was associated with increased hazard of graft failure at 1 year, but protective for long-term graft survival >10 years post-transplant. Female gender, black race and public insurance were associated with increased hazard of graft failure at >3 years. Lower volume transplant centers (vs. high volume >15/yr) were associated with increased hazard of graft failure with longer follow up times, but not 1 year post-transplant.
Conclusions: Drivers of graft failure in pediatric kidney transplant change with increased duration of graft survival. Associations with poor long-term outcomes were age, race, gender, insurance status, and facility related factors, but not therapy related factors. Further studies are warranted to inform policy and systems level changes that promote equity in long-term graft survival.

Abstract# 79

Long Term Safety and Efficacy of Tocilizumab (anti-il6r, Tcz) Therapy in the Treatment of Refractory Chronic Antibody Mediated Rejection (cabmr) in 25 Pediatric Renal Transplant Recipients

M. Pearl[1], P. Weng[1], A. Dokras[2], H. Pizzo[3], J. Garrison[3], C. Butler[1], J. Q. Zhang[1], K. Lim[3], E. Reed[1], I. Kim[3], M. Haas[3], X. Zhang[3], R. Ettenger[1], S. Jordan[3], D. Puliyanda[3], *[1]Pediatric Nephrology, UCLA Medical Center, Los Angeles, CA, [2]Pediatric Nephrology, UT South Western, Dallas, CA, [3]Pediatric Nephrology, Cedars Sinai Medical Center, West Hollywood, CA*

Purpose: Development of de novo donor specific antibodies (DSA) post renal transplantation puts pediatric patients at risk for chronic Antibody Mediated Rejection (cABMR) and allograft failure. Treatment options for cABMR with transplant glomerulopathy are limited. Interleukin-6 (IL6), secreted by immune cells and macrophages stimulates immune responses, and may be important in mediating cABMR. Here we report our experience with TCZ (anti-IL6R) in pediatric renal transplant recipients with biopsy-proven cABMR, refractory to treatment with IVIg/ Rituximab ± plasmapheresis +/- Bortezomib.
Methods: From Jan 2013 to Nov 2018, we identified 25 patients who had ongoing biopsy proven cABMR despite treatment. These patients were treated with TCZ, 4-8mg/kg monthly for a median of 12 (4-26) doses. Patients were monitored for iDSA :immunodominant DSA - DSA with highest Mean Fluorescent Intensity (MFI); renal function, patient and graft survival and adverse effects of TCZ.
Results: Median age at TCZ: 17.8years (6.3- 21.5yrs). Median time from transplant to cABMR diagnosis: 44 months (3-154 months). Median time to TCZ from diagnosis of cABMR: 191(10-1777) days. At diagnosis of cABMR, 19 patients had iDSA :18 had class II;1 had Class I. 13/18 patients with class II DSA had >10,000 MFI. TCZ was well tolerated in 22/25 patients; 2 patients developed fatigue and one JC viremia and therefore discontinued TCZ. At median follow up of 36 (10-83) months post cABMR diagnosis there was no decline in graft function in 24/25 patients: median delta change in serum creatinine: +0.045mg/dl (-0.80 to 3.42); 1 patient lost allograft. 7/19 patients had resolution of DSA. Side effects of TCZ were: 3 patients had mild transaminitis, 2 BK viremia (no BK nephropathy), 1 JC viremia, 1 thrombocytopenia, 2 leucopenia. None had CMV viremia. 1 patient had previous history of PTLD and one had persistent EBV viremia prior to start of TCZ did not show recurrence of PTLD or worsening viremia. Patient and graft survival were 100% and 96% respectively.
Conclusions: Treatment of cABMR with transplant glomerulopathy is challenging. Administration of TCZ in cABMR refractory to anti-B cell therapy resulted in preservation of graft function in the majority of patients. TCZ was fairly well tolerated. The utility of TCZ in treatment of cABMR should be further explored.

Abstract# 80

Leflunomide Therapy for Treatment of Bk Viremia in Pediatric Kidney Transplant Recipients

A. Aldieri[1], M. Chandran[2], D. Matossian[3], B. Magella[4], D. Lazear[4], M. Bock[2], E. Blanchette[2], *[1]Children's Hospital Colorado, Denver, CO, [2]Children's Hospital Colorado, Aurora, CO, [3]Ann & Robert H. Lurie Children's Hospital of Chicago, Chicago, IL, [4]Cincinnati Children's Hospital Medical Center, Cincinnati, OH*

Purpose: BK viremia (BKV) after kidney transplantation (KT) poses significant risk for BK virus-associated nephropathy (BKVN) and impacts graft survival. Conventional treatment involves reduction of immunosuppression therapy (IST) which, in turn may increase risk for rejection. To address this dilemma, use of antiviral therapy with immunosuppressive properties such as leflunomide is an attractive option. We report safety and efficacy of leflunomide use for the eradication of BKV and prevention of BKVN in pediatric kidney transplant recipients (KTRs).
Methods: We describe a multi-center experience with leflunomide for management of BKV over a 10-year period in pediatric KTRs. All patients prescribed leflunomide from 01/2010 - 10/2019 were included in this retrospective chart review and followed from initiation until 1 year following leflunomide completion. Data collected included leflunomide and IST dosing (mg/kg), metabolite trough values (mcg/mL), adverse drug reactions (ADRs), BKV status, renal function, and biopsy data.
Results: 83 pediatric KTR [mean age at KT: 11 years (SD 6.2)] were treated with leflunomide and followed for a mean of 24.4 (12 - 87) months post-BKV diagnosis. BKV was successfully eradicated in 77 (93%) KTR including all 7 (8.4%) with BKN on initial biopsy. Median time from KT to BKV was 6.8 (0 - 76.7) months. Following leflunomide initiation, median time to BKV eradication was 75 (5 - 885) days and to 50% reduction in viremia was 30 (5 - 300) days. IST was reduced from a mean mycophenolate (MMF) dose of 538mg/m^2/day (SD 349) to 316mg/m^2/day (SD 316) and to mean tacrolimus troughs of 4.3-8.1 ng/mL (SD 2.6, 3.4). 79% KTR received maintenance steroids pre-diagnosis and 69.4% post-diagnosis. 24% of subjects received additional therapies (e.g. cidofovir, IVIG). On univariate linear regression, leflunomide troughs (mean 32.3 mcg/mL, SD 15.1) were associated with decreased time to BK eradication (B 5.84, p = 0.004), whereas MMF dosing and steroid use were not. No grafts were lost to BKV or BKN. Estimated glomerular filtration rate (eGFR) was mildly reduced 1-year post BKV diagnosis (78.3, SD 30.0 vs. 72.0, SD 34.2; p = 0.047). Within 1 year of BKV diagnosis, biopsy proven acute rejection (BPAR) occurred in 19 (23.2%) KTR (30.4% cellular, 8.7% humoral, 4.3% mixed). On linear regression, reduced MMF dosing, blood BK PCR at diagnosis, steroid use, and leflunomide trough were not associated with increased BPAR. DSA at 1-year follow-up was associated with increased BPAR (slope 1.37, p = 0.026). Minimal ADRs were reported (10% gastrointestinal, 7.2% hematologic, 2.4% other).
Conclusions: Leflunomide is a promising adjunctive treatment for BKV eradication along with IST reduction and does not appear to increase risk for BPAR or graft loss. Moreover, treatment is associated with minimal ADRs.

Abstract# 81

Risk Factors Predicting Outcomes in Long-Term Pediatric Kidney Transplant Graft Survival

A. Anand, T. H. Malik, J. Dunson, M. F. McDonald, C. R. Christmann, N. Nguyen Galvan, C. O'Mahony, J. A. Goss, P. R. Srivaths, E. D. Brewer, A. Rana, *Baylor College of Medicine, Houston, TX*

Purpose: Pediatric kidney transplant recipients generally have good outcomes post-transplantation; however, the younger age and longer lifespan after transplantation in the pediatric population make understanding the multifactorial nature of long-term graft survival critical. This investigation analyzes factors associated with 10-year survival to identify areas for improvement in patient care.
Methods: Kaplan-Meier with log-rank test as well as univariate and multivariate logistic regression methods were used to retrospectively analyze 7,785 kidney transplant recipients under the age of 18 years from January 1, 1998 until March 9, 2008 using United Network for Organ Sharing (UNOS) data. Our endpoint was death-censored 10-year graft survival after excluding recipients whose grafts failed within one-year of transplant.
Results: Recipients aged 5-18 years had lower 10-year graft survival, which worsened as age increased: 5-9 years (Odds Ratio (OR) 0.66, CI 0.52-0.83), 10-14 years (OR 0.43, CI 0.33-0.55), 15-18 year (OR 0.34, CI 0.26-0.44). Recipient African American ethnicity (OR 0.67, CI 0.58-0.78) and Hispanic donor ethnicity (OR 0.82, CI 0.72-0.94) had worse outcomes than other donor and recipient ethnicities, as did patients on dialysis at the time of transplant (OR 0.82, CI 0.73-0.91). Recipient private insurance status (OR 1.35, CI 1.22-1.50) was protective for 10-year graft survival.

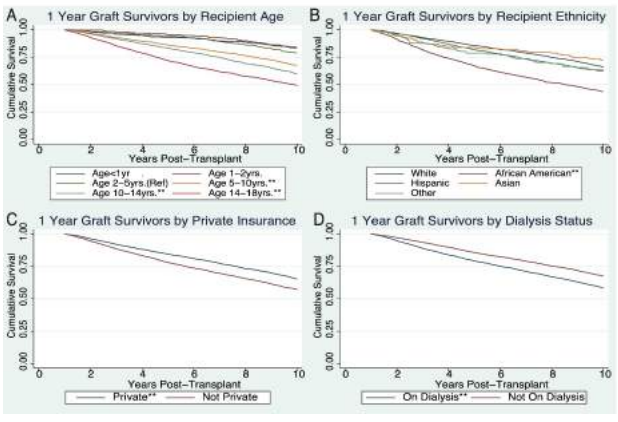

Fig.1 Kaplan-Meier survival function for four factors included in the study. (A) shows death-censored graft survival by recipient age. (B) shows death-censored

graft survival by recipient ethnicity. (C) shows death-censored graft survival by insurance status. (D) shows death-censored graft survival by dialysis status. ** indicates p<0.001.

Conclusions: By establishing the role of age, race, and insurance status on long-term graft survival, we hope to guide clinicians in identifying patients at high risk for graft failure. This study highlights the need for increased allocation of resources and medical care to reduce the disparity in outcomes for certain patient populations.

Abstract# 82

Delayed Graft Function in Pediatric Living Donor Kidney Transplantation

M. MacConmara, J. Shah, L. de Gregorio, D. Desai, P. Vagefi, C. S. Hwang, *Surgery, UT Southwestern Medical Center, Dallas, TX*

Purpose: Pediatric recipients of living donor kidneys have a low rate of delayed graft function (DGF). The aim of this study was to examine the incidence, risk factors and outcomes of DGF in pediatric patients who received a living donor allograft.

Methods: The UNOS database was queried to examine all pediatric patients transplanted with a living donor kidney between 2000—2020. A pediatric recipient was defined as one who was transplanted prior to the age of 18 years. Donor and recipient demographic data were examined, as were survival and outcomes. DGF was defined as the need for dialysis within the first week after transplant. A p-value of <0.05 was considered to be significant.

Results: 6,480 pediatric patients received a living donor (LD) kidney transplant during the study period. 269 (4.2%) developed DGF post-transplant. Donors were similar in age DGF and control groups (37.2 vs. 37.0 yrs), had similar preoperative creatinine (0.86 mg/dL in both), ethnicity, and gender, but donor BMI was higher in the DGF group (27.6 vs. 26.8 kg/m^2, p=0.004). Cold ischemia time (2.4 vs. 2.3 h) was also similar. Recipients of kidneys with DGF were similar in age (9.8 vs. 10.1 y), and had higher BMI (20.3 vs. 19.4 kg/m^2, p=0.002). Initial and final cPRAs were similar (2.2 vs. 2.4% initial; 10.5 vs. 8.9% final). HLA mismatch was similar in both groups (3.0 vs. 2.8). Focal segmental glomerulosclerosis (FSGS) was the most common diagnosis in recipients with DGF (23%) and was significantly more frequent in the DGF group compared to control (23% vs. 10%, p=0.001). Small recipients (weight < 15 kg) were found to have a significantly higher rate of DGF (24.9 vs. 19.8%, p=0.04). Length of stay for recipients with DGF was twice that of the control group (23.4 vs. 10.1 d, p<0.0001). Patients with DGF had higher rates of rejection at 6 and 12 months post transplant (24.8 vs. 8.0% at 6 months, p<0.0001; 26.4 vs. 11.6% at 12 months, p<0.0001). Recipients of LD kidneys who developed DGF had significantly worse allograft survival when compared to control (Figure 1, p<0.0001) with 1 year graft survival over 30% lower than control (67% vs. 98%). The most common causes of allograft loss were graft thrombosis (25.3%), rejection (17.5%), and recurrent disease (15.6%).

Conclusions: Pediatric living donor kidney transplant recipients who experience DGF have significantly poorer allograft survival. Immunologic events, recurrent disease and technical complications appear to underlie these poor outcomes and should be considered especially in younger recipients with FSGS. Optimizing the donor recipient combination to avoid compounding risks should allow for better outcomes.

Liver Transplant Oncology

Abstract# 83

Outcomes of Downstaging Hepatocellular Carcinoma (HCC) to within Milan Criteria Before Liver Transplantation (LT): A Multicenter Analysis of the "All-comers" Protocol

B. Natarajan[1], P. Tabrizian[2], M. Hoteit[3], C. Frenette[4], T. Ghaziani[5], R. Dhanasekaran[5], N. Parikh[6], J. Guy[7], A. Shui[1], S. Florman[2], F. Yao[1], N. Mehta[1], *[1]UCSF, SF, CA, [2]Mt Sinai, NY, NY, [3]U Penn, Philadelphia, PA, [4]Scripps, La Jolla, CA, [5]Stanford, Palo Alto, CA, [6]U Michigan, Ann Arbor, MI, [7]CPMC, SF, CA*

Purpose: Patients with HCC meeting UNOS-downstaging (DS) criteria (1 lesion 5.1-8 cm, 2-3 lesions at least one 3.1-5 cm and total tumor diameter (TTD) ≤8 cm, or 4-5 tumors ≤3 cm with TTD ≤8 cm) have excellent LT outcomes after successful DS. However, the likelihood of successful DS and LT-related outcomes for "all-comers" (AC) patients with tumor burden initially exceeding UNOS-DS criteria is poorly understood.

Methods: Consecutive patients with HCC meeting AC (n=82) or UNOS-DS criteria (n=230) at 7 LT centers in 4 UNOS regions were enrolled from 2015-2020 and prospectively followed to evaluate downstaging and LT outcomes.

Results: Median pre-treatment characteristics between the AC and UNOS-DS groups did not significantly differ in terms of MELD (9 vs 9), Child-Pugh (CP) score (6 vs 6), and AFP (20 vs 12 ng/mL). TTD prior to first local-regional therapy (LRT) was 10.0 cm for AC (IQR 8.3-12.9) vs 6.2 cm for UNOS-DS (IQR 5.5-7.1) (p<0.001). AC patients required more LRT to be downstaged (2 vs 1; p=0.001) and had a lower probability of successful downstaging (69% vs 85% within 12 months; p<0.001). In multivariable (MV) analysis of the AC cohort, increasing sum of largest tumor diameter plus number of lesions prior to first LRT was negatively associated with successful downstaging (HR 0.82; p=0.026). Dropout probability due to tumor progression or death was similar at 3 years (AC 52% vs UNOS-DS 45%, p=0.27) with pre-treatment CP class B/C the only factor associated with dropout in the AC cohort (HR 2.58 vs CP A; p=0.009). Intention-to-treat (ITT) survival at 3 years was 69% for UNOS-DS vs. 58% for AC (p=0.07) and reduced to 23% in AC with CP B/C cirrhosis. Probability of LT at 3 years was 42% for AC vs. 58% in UNOS-DS (p=0.11) with no differences in explant tumor stage, grade, or vascular invasion. In the combined cohort, 39% were under-staged on explant. Factors associated with under-staging in MV logistic regression included increasing sum of largest tumor diameter plus number of lesions on last imaging prior to LT (OR 1.4; p=0.006) and AFP ≥20 (OR 6.4; p=0.004). Post-LT 2-year survival was 91% for AC vs 90% for UNOS-DS (p=0.67) with HCC recurrence observed in only 5% of AC after median post-LT follow-up of 19 mo.

Conclusions: In this first prospective multi-regional comparative study on HCC downstaging, we observed an overall 70% probability of successful downstaging in AC with increasing pre-treatment tumor burden associated with unsuccessful downstaging. 3-year ITT survival in AC was nearly 60% though AC with CP B/C had poor survival. Explant pathology and 2-year post-LT outcome was similar between cohorts suggesting that LT is a reasonable goal in selected AC patients though efforts to improve under-staging are needed.

Abstract# 84

Role of Baseline PD-1 Checkpoint Inhibitor Pathway Expression in Bridge to Liver Transplant Hepatocellular Carcinoma

K. Nunez, T. Sandow, M. Hibino, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

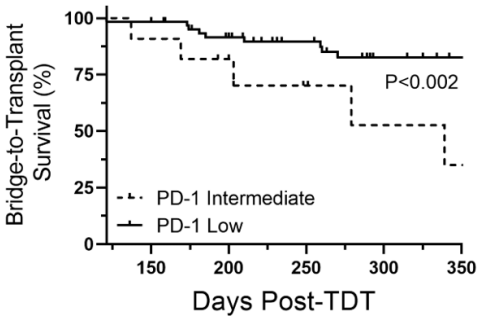
Purpose: Response to first line liver-directed therapy (LDT) in hepatocellular carcinoma (HCC) has important implications in both bridge to transplant (BTT)

success as well as post-transplant recurrence-free survival. An effective anti-tumoral T cell response following LDT is a critical barrier against tumor progression. In this study, we investigated baseline T cell count and the PD-1 checkpoint inhibitory pathway as indicators of T cell exhaustion and the role in LDT response and BTT outcome.

Methods: Treatment-naïve HCC patients receiving LDT were prospectively enrolled. Preprocedural peripheral blood was collected and T cells characterized for lineage and phenotype by flow cytometry. LDT response was assessed by mRECIST.

Results: Univariate analysis of the cohort (n=86) confirmed incomplete response to first line LDT (P=0.003, OR 7.6) was closely associated with BTT survival and waitlist tumor progression (P<0.001). We then performed univariate analysis to identify T cell-linked factors associated with an incomplete response to LDT. Pre-treatment absolute lymphocyte count (ALC) (P=0.009, OR 0.44) as well as CD4:CD8 lineage specific PD-1 expression (P=0.043, OR 3.0 and P=0.010, OR 3.3 respectively) were associated with risk of incomplete response. LDT-induced decrease in PD-1 expression in CD8 T cells in patients with elevated PD-1 at baseline (P<0.001) while a LDT-induced increase in PD-1 expression was observed in CD4 T cells in patients with low baseline PD-1 expression (P=0.018). Further, elevated PD-1 expression was associated with increased risk of BTT tumor progression (P=0.002, HR = 4.6, 95%CI 1.7-11.7). In patient's successfully bridged to liver transplantation, an elevated PD-1 expression profile at baseline or follow-up was associated with advanced tumor staging (P<0.001), with 75% of PD-1 high patients having T3-T4 TNM staging compared to 0% with intermediate/low PD-1 expression.

Conclusions: Low lymphocyte count and activation of the PD-1 checkpoint inhibitor pathway is associated with risk of incomplete response to LDT and waitlist tumor progression. Patients with impaired T cell homeostasis may benefit from adjuvant immunotherapy to improve response to LRT and improve bridge to transplant outcomes.



At Risk	0	150	200	250	300	350
PD-1 High	13	11	8	6	4	3
PD-1 Inter/Low	67	61	51	42	32	25

Abstract# 85

NASH-Related HCC is Associated with Lower Rates of Post-Transplant HCC Recurrence: A Large Database Analysis

P. J. Altshuler, R. Lamm, K. Patel, H. Dang, O. Shaheen, A. P. Shah, J. Glorioso, C. G. Ramirez, A. M. Frank, W. R. Maley, A. S. Bodzin, *Department of Surgery, Thomas Jefferson University, Philadelphia, PA*

Purpose: As incidence of hepatocellular carcinoma (HCC) and Non-Alcoholic Steatohepatitis (NASH) increase, NASH-related HCC is an increasingly common transplant indication. Large-scale studies evaluating transplantation for NASH-related HCC are limited, as are studies controlling for metabolic disturbances and systemic comorbidities characteristic of NASH patients. This study attempts to address both, comparing transplantation for NASH-related HCC to non-NASH-related HCC on a national scale.

Methods: Retrospective analysis of the Organ Procurement and Transplantation Network database identified 1342 NASH and 10,642 non-NASH patients with HCC. After propensity score matching (PSM) to address patient and tumor-related confounders 1175 of each group remained. Primary outcomes assessed were recurrence and recurrence free survival. Additional regression modeling assessed NASH as a predictor of death or recurrence.

Results: Upon PSM baseline recipient, donor, transplant and tumor characteristics were largely similar between NASH and non-NASH groups. BMI did remain higher in NASH patients (31.7 vs. 28, p<0.01) as did recipient age (65 vs. 64, p=0.02) and incidence of diabetes (72.1% vs. 31.4%, p<0.01). Recipient ethnicity also remained disparate. As demonstrated in Table 1, recurrence at 5 years was lower 5.5% in NASH vs. 8.4% in non-NASH patients (p=0.02). Recurrence-free survival at 5 years was 78.3% in NASH vs. 74.5% in non-NASH patients (p=0.08). Adjusted multivariable regression accounting for factors independently predictive of recurrence at 5 years demonstrated that NASH was protective against recurrence (HR: 0.63, p<0.01).

Conclusions: In a large-scale propensity matched analysis, HCC in NASH patients appears less likely to experience HCC recurrence at 5 years leading to improved recurrence-free survival. This is supported by NASH itself being a protective factor against cancer recurrence in adjusted regression analysis. While ongoing investigations into the biology of HCC in NASH and non-NASH are essential, this study suggests that HCC in NASH may have improved cancer outcomes after transplant.

Table 1: Propensity matched transplant outcomes by diagnosis of NASH

		NASH	Non-NASH	HR	95% CI	p-value
Number		1175	1175			
Recurrent malignancy at 5 years		5.5%	8.4%	0.62	0.42-0.92	0.02
Median time to recurrence		360 (206-742)	358 (177-724)	-	-	0.51
Recurrence free survival						
	30-day	98.0%	98.5%	1.36	0.72-2.55	0.33
	1-year	91.3%	91.4%	1.03	0.77-1.37	0.84
	5-year	78.3%	74.5%	0.83	0.68-1.02	0.08

Abstract# 86

Adjuvant Immunotherapy for Liver Transplant Recipients with Hepatocellular Carcinoma Using Donor Liver-derived Natural Killer Cells

M. Ohira[1], R. Hotta[1], Y. Imaoka[1], K. Sato[1], N. Tanimine[1], Y. Tanaka[1], S. Nishida[2], A. Tzakis[2], H. Ohdan[1], *[1]Hiroshima University, Hiroshima, Japan, [2]University of Miami, Miami, FL*

Purpose: Hepatocellular carcinoma (HCC) is one of the most common cancers worldwide and is an indication for liver transplantation (LT). Immunosuppressive regimens currently used after LT reduce the proportion of adaptive components of cellular immunity while maintaining innate components. Natural killer (NK) cells play a central role in innate immunity against neoplastic cells; therefore, their augmentation is a promising immunotherapeutic approach against HCC recurrence after LT.

Methods: We propose that adoptive transfer of IL-2-stimulated TRAIL$^+$ NK cells extracted from donor liver graft perfusate can mount an anti-tumor response without causing toxicity to intact recipient tissues.

Results: We have successfully performed NK-cell immunotherapy in 45 living donor LT (LDLT) recipients with HCC in Japan. The median follow-up period is 68 months. In the series of LDLT with HCC, among the 101 patients who met the Milan criteria (MC) on preoperative imaging (NK group n=37; control group n=64), 38 patients (37%) had HCC exceeding MC on postoperative pathology. Of these 38 patients, the recurrent free survival (RFS) rates were significantly improved in the NK group (n=16) as compared to those in the control group (n=22). Their 5 year-RFS were 75% and 48%, respectively (p=0.042). After infusion of NK cells, the NK cytotoxicity and the proportion of TRAIL$^+$ NK cells in the peripheral blood of patients increased significantly (p<0.05). The inoculated donor NK cells could be confirmed for up to 1 month through the analysis of peripheral blood chimerism. We also applied the proposed approach to the deceased donor LT (DDLT) recipients in collaboration with the US since 2009. This phase I study included 17 subjects

with a median follow-up of 96 months. No study-related adverse events were noted in either of the studies. Regarding overall survival, the high-dose group had significantly better survival than the low-dose group (p = 0.0064). In the series of DDLT with HCC, among the 17 patients who met MC on preoperative imaging, 9 patients (53%) had HCC exceeding MC on postoperative pathology. None of the patients have shown any symptom of HCC recurrence. Interestingly, the number of HLA mismatches between donor and recipient was associated with tumor recurrence after NK cell therapy.

Conclusions: In conclusion, the administration of IL-2-stimulated NK cells derived from both living and deceased donor liver allografts was safely applied and is, therefore, a potential novel adjuvant immune treatment after LT in HCC patients.

Abstract# 87

T Cell Repertoire Diversity in HCV-Associated Hepatocellular Carcinoma Patients Waitlisted for Liver Transplantation and Receiving Liver-Directed Therapy

K. Nunez, T. Sandow, A. Cohen, P. Thevenot, *Ochsner Health, New Orleans, LA*

Purpose: T cell receptor (TCR) sequencing in hepatocellular carcinoma (HCC) patients revealed a diverse TCR repertoire in hepatitis B-associated HCC-infiltrating T cells. In this study, we investigate changes in TCR diversity in both viremic and nonviremic hepatitis C-associated HCC (HCV-HCC) patients following liver-directed therapy (LDT) and links to bridge to transplant waitlist outcome.

Methods: HCV-HCC patients receiving LDT as a bridge to liver transplantation were prospectively enrolled at a high-volume transplant center. Peripheral blood T cells were characterized by flow cytometry at baseline and treatment follow-up as well as longitudinally while on the waitlist. T cell DNA isolated at each time point was sequenced and analyzed using ImmunoSeq Analyzer (Adaptive Biotechnologies). Response to LDT was assessed by mRECIST.

Results: The cohort (n=17) was stratified based on HCV status (viremic n=10 and nonviremic n=7). Only 3 TCR clonotypes were shared over the entire cohort. Viremic HCV was associated with a more diverse T cell repertoire prior to and following LDT (P=0.007 and P=0.032). LDT resulted in a treatment-dependent increase in TCR diversity (P=0.034) and unique TCR clonotypes at follow-up independent of response to LDT. TCR diversity was strongly correlated with T cell senescence (CD57) as well as the PD-1 checkpoint inhibitor pathway in both CD4 (P=0.009 and P=0.037) and CD8 T cells (P=0.016 and P=0.019), respectively. Low TCR diversity following LDT was also associated with waitlist tumor progression (P=0.015). In patients successfully bridged to liver transplantation, 2.3-10.4% of intratumoral T cell clonotypes found in explant tumors were also found in circulating T cells prior to LDT. The percentage of clonotype overlap between TILs and circulating T cells did not change following treatment.

Conclusions: The TCR repertoire is diverse in HCV-HCC patients and shifted based on viremic HCV status and LDT. HCV-HCC patients with low TCR diversity following treatment are at greater risk of tumor progression which may be mediated by T cell senescence and checkpoint inhibitory pathways. Longitudinal TCR profiling may uncover unique HCC biology or treatment pathways linked to effective neoantigen responses and improved bridge to transplant outcomes.

Abstract# 88

Living Donor Liver Transplant for Unresectable Colorectal Metastasis: A Case Series

B. Emmanuel, H. Al-Harakeh, A. Humar, C. Hughes, A. Tevar, M. Molinari, A. Ganoza, *Starzl Transplant Institute, UPMC, Pittsburgh, PA*

Purpose: Colorectal Cancer (CRC) represents the third most common malignancy worldwide. In the US, CRC lifetime risk is approximately 1 in 23 (4.4%) for men and 1 in 25 (4.1%) for women. For those with unresectable disease, survival rates are 10% for 5 years. Liver transplantation has been sought out as a treatment for such unresectable malignancies and has been explored with the SECA study from Oslo University Hospital in Norway. Their results showed overall survival at 1, 3 and 5 years were 95%, 68% and 60% respectively. Disease-free survival (DFS) was 35% at 1 year and 0% at 2 years. This case series reports the experience of living donor liver transplantation for unresectable colorectal metastasis in 5 patients.

Methods: The medical records of five patients with CRC who underwent living donor liver transplant for unresectable colorectal metastasis to the liver from 2019 to 2020 were reviewed.

Results: Our 5 patients are Caucasian males with ages ranging from 38 to 67. Mean age for 5 participants is 56. Rectal tumors were identified in 3 of the 5 patients and the remaining 2 had colonic tumors. All patients had resection of their primary tumor and completed chemotherapy regimens prior to evaluation for transplant. All patients had Liver resections for treatment of metastasis with recurrence of tumor and were deemed unresectable. Average time from initial diagnosis to transplant was 72 months with a range of 13-113 months. On day of transplant, an exploratory laparotomy was performed prior to the donor to evaluate for extrahepatic metastasis. Patients were transplanted with a right lobe allograft from a living donor. Blood transfusion were utilized intra-operatively in 2 of 5 patients, and received 1, and 3 units packed red blood cells respectively. Post operatively, all patients placed on immunosuppression regimen with IL-2R induction, and tacrolimus/mycophenolate mofetil for first 4. Post-operative complications included 1 biliary leak, 1 episode of rejection treated with appropriate steroid therapy and recovered. All patients are alive, none lost to follow up. One evidence of recurrence in the transplanted allograft occurred and is currently under treatment with RFA. Time to recurrence in this patient was 7 months. Follow-up duration ranged from 1 month to 19 months, with a mean of 10.6 months.

Conclusions: Our case series describes 5 patients treated for CRC and presenting with, or later developed liver metastasis. After treatment with appropriate chemotherapeutic agents and recurrence after surgical intervention, they were all deemed further unresectable. Liver transplantation is a viable option to treat this group of patients and is currently being used in certain areas in Eastern countries. Long term follow-up will be needed to evaluate for recurrence in the allograft in our remaining patients.

Abstract# 89

Liver Transplantation for Unresectable Colorectal Cancer Liver Metastases: A Multicenter Experience

L. I. Ruffolo[1], K. Sasaki[2], K. Tomiyama[1], A. Nair[1], M. Orloff[1], B. Al-Judaibi[3], M. Levstik[3], M. Laryea[3], K. Dokus[1], J. Errigo[1], A. Moro[2], C. Quintini[2], K. Hashimoto[2], M. Fujiki[2], K. Menon[2], C. Kwon[2], T. Diago Uso[2], R. Hernandez-Alejandro[1], F. Aucejo[2], *[1]Surgery, University of Rochester Medical Center, Rochester, NY, [2]Surgery, The Cleveland Clinic Foundation, Cleveland, OH, [3]Transplant Hepatology, University of Rochester Medical Center, Rochester, NY*

Purpose: Colorectal cancer is the third leading cause of cancer related death, unfortunately 50% of patients will develop colorectal liver metastases (CRLM), and a minority of these patients undergo resection. Unfortunately, best 5-year survival for liver-confined CRLM remains poor at ~10%. Here we present a North American experience in applying hepatectomy and orthotopic liver transplantation (LT) for CRLM.

Methods: Multidisciplinary teams reviewed available international data and developed strict criteria for evaluating liver-confined unresectable CRLM for LT. Patient and donor clinicopathologic data was prospectively collected following informed consent for inclusion into institutional registries. Experiences from two high-volume LT centers were pooled for outcome analysis.

Results: Independent protocols were established at two large volume transplant centers in the United States. Criteria between centers was similar in excluding established risk factors for recurrence including: failure to demonstrate response to chemotherapy, largest lesion exceeding 5 cm in diameter, oncogene activating mutations, and presence of extrahepatic disease during surveillance period of response. Between the two centers, 54 patients were evaluated and followed for consideration. Forty-four patients dropped out due to progression. The remaining 10 patients met criteria and underwent OLT, 8 receiving grafts from living donors, and two from donation after brain death. These patients were on average 46.3 years of age, and 40% female. Ninety-day mortality was 10%. With a median follow up

of 400 days, the cohort exhibits a 388 day median disease free survival, and 80% of patients are alive after LT. The four patients who experienced disease recurrence underwent select metastasectomy or adjuvant chemotherapy. Kaplan Meier estimate for overall survival is shown in Figure 1.

Conclusions: To date, our experience is rapidly evolving with LT for CRLM, however a clear finding is the high rate (81%) of drop out when utilizing strict selection criteria. Early followup data is encouraging with excellent overall survival and acceptable recurrence free survival. These results suggest that with strict selection criteria, good results are obtainable.

Abstract# 90

Outcomes of Liver Transplantation for Combined Hepatocellular Cholangiocarcinoma: A Single-center Experience

Y. Liu[1], C. Hanlon[1], S. Zhou[1], D. Toy[1], K. King[2], K. Zhou[3], J. Kahn[3], L. Yuan[3], *[1]Internal Medicine, USC Keck School of Medicine, Los Angeles, CA, [2]Radiology, USC Keck School of Medicine, Los Angeles, CA, [3]Internal Medicine - Gastrointestinal and Liver Disease, USC Keck School of Medicine, Los Angeles, CA*

Purpose: Combined hepatocellular cholangiocarcinoma (cHCC-CCA) is a hepatic tumor that exhibits histological features of both hepatocellular carcinoma (HCC) and cholangiocarcinoma (CCA). cHCC-CCA is often diagnosed incidentally on explant. Clinical traits associated with cHCC-CCA and predictors of transplant outcomes should be identified to best allocate organs.

Methods: 308 patients who underwent OLT for the indication of HCC as well as those with cHCC-CCA found on explant at Keck Hospital from 2002 to 2020 were reviewed. A cohort of patients with cHCC-CCA on explant was identified, and features/outcomes were compared to patients with HCC alone on explant.

Results: 15 patients were identified to have cHCC-CCA or both HCC and CCA; 1 patient had isolated CCAs on explant. HCV was the major etiology of cirrhosis in both cohorts. Three cHCC-CCA phenotypes were identified: cHCC-CCA with other HCC or CCA nodules (n=6), cHCC-CCA alone (n=5), and concurrent discrete HCC and CCA nodules (n=4). Microvascular invasion on explant was present in 31% of the cHCC-CCA cohort compared to 7% in pure HCC (p=<0.001). 3-year survival was 62% in the cHCC-CCA cohort compared to 88% for HCC (p=0.02).

Conclusions: Demographic and clinical features between HCC and cHCC-CCA are nearly identical, necessitating further modalities such as biomarkers to be developed to identify cHCC-CCA to aid transplant evaluation. Three unique phenotypes of cHCC-CCA were identified, and further identification/long-term follow up of cases should be pursued to characterize survival respectively to revise exclusion/inclusion criteria for cHCC-CCA.

Lung

How to Expect the Unexpected- Incorporating Predictors into Lung Transplant Decision Making

Abstract# 91

A Molecular Classifier Identifies Antibody-Mediated Rejection-Associated Changes in Lung Transplant Biopsies

K. S. Madill-Thomsen[1], K. M. Halloran[2], M. Parkes[1], P. F. Halloran[1], &. the INTERLUNG Study Group[3], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]University of Alberta, Edmonton, AB, Canada, [3]., ., AB, Canada*

Purpose: Identifying lung transplant antibody-mediated rejection (ABMR) has been controversial. We compared gene expression in donor-specific antibody (DSA)

positive vs. DSA negative lung transbronchial biopsies (TBBs) to determine if DSA was associated with molecular changes similar to those in rejecting kidney and heart transplant biopsies.

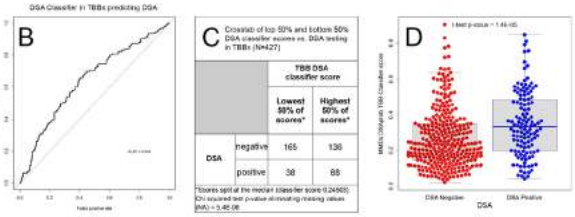
Methods: Biopsies were prospectively collected from 10 international centers in the INTERLUNG study: 635 TBBs from 532 patients and 348 third-bifurcation mucosal biopsies (3BMBs) from 307 patients. A machine learning classifier for predicting DSA positivity was trained on DSA in TBBs; scores were represented as the median of 12 estimates.

Results: Of 635 TBBs, 427 were DSA tested: 126 DSA positive (median 276 days post-transplant), and 301 DSA negative (median 303 days post-transplant). In TBBs, DSA was associated with increased expression of transcript sets representing inflammation, parenchymal dedifferentiation, and atrophy-fibrosis (Figure 1A). Transcripts increased in DSA positive TBBs included many interferon gamma (IFNG)-inducible transcripts increased in rejecting hearts and kidneys: CXCL9/10/11, IL18BP, PLA1A, SLAMF8, APOL6, HLA-DQA1, and HLA-DPB1. Transcripts associated with NK cells were not increased (e.g. KLRD1, GNY, and PRF1). A DSA probability classifier developed in TBBs predicted DSA positivity (AUC=0.64, Figure 1B). High classifier scores were strongly associated with DSA positivity in a chi-squared test (Figure 1C, p=5.4E-06) and t-test (p=1.4E-05, Figure 1D). Classifier scores were increased overall in DSA positive biopsies (Figure 1D). DSA probability classifiers developed in transplanted hearts and kidneys predicted DSA positivity in TBBs (AUC=0.60 and AUC=0.57, respectively). Many transcripts increased in DSA positive TBBs were also significantly associated with the TBB DSA classifier scores. Similar approaches in 3BMBs with available DSA testing results showed weaker signals for DSA positivity than in TBBs. There was no strong association of DSA with CLAD.

A Pathogenesis-based transcript set scores associated with DSA positivity in TBBs (N=635)

Class	Pathogenesis based transcript set scores[1]	DSA Positive (N=126) mean (p-value)	DSA Negative (N=301) mean (p-value)
Parenchymal injury	IRITD3 Injury/repair-induced transcripts	0.02 (0.05)	-0.01
	IRITD5 Injury/repair-induced transcripts	0.05 (0.01)	-0.02
Atrophy-fibrosis	COL1356 – Collagen transcripts	0.17 (0.01)	-0.05
	FICOL – Fibrillar collagen transcripts	0.19 (0.01)	-0.06
	IGT – Immunoglobulin transcripts	0.26 (0.001)	-0.08
Parenchymal	LT1 – TBB parenchymal transcripts	-0.10 (0.01)	0.11
	LT2 – TBB parenchymal transcripts (solute carriers excluded)	-0.05 (0.01)	0.06
Macrophages	AMAT1 – Alternatively activated macrophage transcripts	0.06 (0.03)	-0.06
Rejection	GRIT3 – Interferon gamma-inducible transcripts	0.06 (0.001)	-0.04
	QCAT – Cytotoxic T cell transcripts	0.05 (0.06)	-0.05
	RAT – Rejection-associated transcripts	0.07 (0.01)	-0.07

P-value from unpaired, two-sided Welch's t-test.
[1] Derived by Parkes et al. PubMed ID: 28640855



Conclusions: DSA positivity is associated with IFNG-induced and injury-related transcripts and transcript sets. DSA positivity can be used to derive a molecular classifier that identifies TBBs with antibody-mediated rejection-associated changes similar to those seen in transplanted hearts and kidneys. The functional and prognostic significance of lung ABMR changes can now be explored.

Abstract# 92

Molecular Classifiers for Chronic Lung Allograft Dysfunction Transbronchial and Mucosal Biopsies Predict Clinical CLAD and Graft Loss

M. D. Parkes[1], P. F. Halloran[2], K. M. Halloran[3], &. the INTERLUNG Study Group[4], *[1]Alberta Transplant Applied Genomics Centre, Edmonton AB, AB, Canada, [2]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [3]University of Alberta, Edmonton AB, AB, Canada, [4]., ., AB, Canada*

Purpose: Chronic lung allograft dysfunction (CLAD) portends poor outcomes yet is poorly understood. In the multi-center INTERLUNG study we measured transcripts in transbronchial biopsies (TBBs) and mucosal biopsies from the third bronchial bifurcation (3BMBs) using microarrays and documented CLAD-associated gene expression. We studied whether probabilistic gene-based estimates of CLAD are associated with risk of graft loss by 1 year post-biopsy.

Methods: We collected 498 TBBs from 423 transplants (3BMB: 324, 285) with known CLAD status. We identified CLAD-associated transcripts and gene set scores. Elastic net -regularized logistic regressions predicting CLAD were fit on 20 genes associated with CLAD after correcting for clinical confounders, time post-transplant, and MMDx T cell mediated rejection (TCMR). We fit multivariate Cox proportional hazards models on predicted CLAD probability, MMDx TCMR probability, time post-transplant, and interaction between CLAD and MMDx TCMR probabilities. TBBs represented 35 failures, 3BMBs 27.

Results: CLAD-associated gene expression changes reflected parenchymal dedifferentiation and response-to-wounding, especially atrophy/fibrosis, but some were also associated with clinical confounders and, in 3BMBs, time post-transplant. Some IFNG-inducible genes (e.g. HLA-DOA) were associated with CLAD in 3BMBs but not TBBs. CLAD and DSA were uncorrelated.

The regressions predicted CLAD with AUC 0.68 (TBB) and 0.73 (3BMB). In TBBs each 0.1 increase in CLAD probability was associated with 1.8x hazard of graft loss by 1 year post-biopsy (p=3x10^{-8}), compared to 1.4x in 3BMBs (p=0.005). The CLAD probability outperformed the clinical diagnosis in TBBs although not in 3BMBs. Each 0.1 increase in MMDx TCMR probability multiplied hazard by 1.2 in TBBs (p=0.02) and 3BMBs (p=0.08), but it did not compound hazards with the CLAD score.

Conclusions: CLAD resembles a parenchymal response to wounding that overlaps other pathologies and is better captured in 3BMBs. The CLAD classifiers agreed more closely with clinical diagnoses in 3BMBs than TBBs, but in both cases the scores reflected a CLAD-like phenotype and were associated with increased risk of graft loss by 1 year post-biopsy. Molecular detection of CLAD-like changes may aid patient management when other conditions exclude CLAD or when the diagnosis is uncertain.

Abstract# 93

Assessing the Accuracy of the Lung Allocation Score

N. Dussault[1], W. Parker[1], R. Jablonski[1], E. Garrity[1], M. Churpek[2], *[1]University of Chicago, Chicago, IL, [2]University of Wisconsin-Madison, Madison, WI*

Purpose: The Lung Allocation Score (LAS) relies on the performance of two cox proportional hazards models that estimate waitlist and post-transplant survival. These models were developed using data from 2005-2008; it is unknown if they remain accurate.

Methods: This was an observational cohort study of all lung transplant candidates and recipients greater than 12 years listed or transplanted between February, 19th 2015 to February, 19th 2019 in the Scientific Registry of Transplant Recipients database. We evaluated the discrimination of the waitlist and post-transplant models with the concordance probability estimate and the calibration of each model by comparing predicted versus observed one-year restricted mean survival times. We evaluated the overall accuracy of the LAS by comparing a non-parametric estimate of the observed LAS with the actual LAS at transplant for each recipient percentile.

Results: During the study period, 11,539 eligible candidates were listed for transplant and 9,377 eligible recipients were transplanted. The waitlist model ranked candidates in the correct risk order 72% of the time (95% CI 71 - 73%) and underestimated survival by 59 days (95% CI 57 - 61 days) on average. The miscalibration increased from 6 days of error (95% CI 4 - 9 days) in the lowest risk decile to 136 days (95% CI 107 - 164 days) in the highest risk decile. The post-transplant model ranked recipients in the correct risk order 57% of the time (95% CI 55 - 58%) and underestimated post-transplant survival by 25 days (95% CI 23 - 27 days) on average. The miscalibration increased from 10 days of error in the lowest risk decile (95% 7 - 14 days) to 70 days (95% CI 64 - 77) in the highest risk decile. Overall, a recipient's LAS at transplant explained only 56% of variation in the observed LAS.

Conclusions: The waitlist and the post-transplant models that form the backbone of the LAS are inaccurate, limiting the ability of the system to rank candidates in the correct order. The LAS should be updated using a modern cohort patient cohort.

Abstract# 94

Liver Kinase B1 Knockdown Induces Platelet-Derived Growth Factor Receptor B Expression in Human Airway Epithelial Cells: A Potential Mechanism for Development of Fibrosis Leading to Chronic Lung Allograft Dysfunction

M. Rahman, J. Lee, R. Ravichandran, T. Fleming, M. Smith, R. Bremner, T. Mohanakumar, *St. Joseph's Hospital and Medical Center, Phoenix, AZ*

Purpose: The platelet-derived growth factor and its receptor (PDGFRb) signaling pathway can be activated by epithelial mesenchymal transition which facilitates fibrosis. It is not known how PDGFRb is regulated following human transplant. We found that a tumor suppressor gene, liver kinase B1 (LKB1) knockdown induced epithelial mesenchymal transition in BEAS-2B airway epithelial cells. Furthermore, LKB1 was down regulated in lung transplant recipients diagnosed with chronic lung allograft dysfunction (CLAD). Since LKB1, a protein kinase 1, can regulate fibrosis, we investigated the role of LKB1 in the regulation of PDGFRb and, therefore, fibrosis leading to CLAD.

Methods: To investigate the relationship between LKB1 and PDGFRb signaling pathways to define the mechanisms of development of CLAD following lung transplant. LKB1 was knocked down by siRNA in an airway epithelial cell line, BEAS-2B. The effect of LKB1 knockdown on gene regulation was measured by nanoSTRING technology. Differential gene expression analysis was performed to identify genes which were up-regulated or downregulated by LKB1 siRNA or control siRNA. Further downstream analysis was done by knocking down PDGFRb using siRNA and the effect was measured by western blot analysis. We also analyzed PDGFRb expression by real-time PCR in BOS biopsies (n=5) and stable biopsies (n=5).

Results: In nanoSTRING platform, LKB1 knockdown significantly induced PDGFRb expression in BEAS-2B cells compared to the control siRNA (p=0.005). Densitometry analysis showed knocking down PDGFRb in BEAS-2B cells significantly inhibited NFκB (p=0.04), TNF-α (p=0.001), and phosphorylation of STAT3 (p=0.001). Kα1T (p=<0.05) and fibronectin (p=<0.05) expression were also significantly down-modulated following PDGFRb knockdown. We also analyzed the level of PDGFRb in human lung biopsies diagnosed as BOS and compared with biopsies from stable patients by real time PCR. We found PDGFRb expression was significantly increased in BOS biopsies when compared to stable biopsies (p=0.04).

Conclusions: We identified a novel molecular mechanism in which LKB1 knockdown induces PDGFRb expression and regulates the NFκB-TNFα-STAT3 signaling pathways. Therefore, LKB1 downregulation, can play a significant role in the pathogenesis of CLAD after lung transplant.

Abstract# 95

Allograft Discard Risk Index for Lung Transplantation

R. M. Reul, G. Loor, P. S. Garcha, A. A. Rana, *Baylor College of Medicine, Houston, TX*

Purpose: The demand for donor lungs continues to outpace the supply, yet nearly 80% of donor lungs consented for lung transplantation (LTx) are discarded.

Methods: We reviewed all deceased organ donors listed within the UNOS Deceased Donor Database between 2005 and 2015. Donors > 10 years old and consented for lung donation were included in our analysis. Univariate and multivariate analyses were run on the training set (n=80,614) with the primary outcome of lung discard, and the results were used to create a discard risk index (DSRI). Discard data was assessed at DSRI value deciles using the validation set (n=40,306), and differences in 1-year mortality were assessed using stratum-specific likelihood ratio (SSLR) analysis. Marginal donors were defined as the top 50 percentiles of DSRI values for a high-volume center analysis.

Results: Donor factors most associated with higher DSRI values included age > 65, PaO2 < 300 on 100% FiO2, HCV, and cigarette use. Factors associated with lower DSRI values included donor age < 40, and PaO2 > 400. The DSRI was a reliable predictor of donor discard, with a C-statistic of 0.870 in the training set and 0.873 in the validation set. The DSRI was not a reliable predictor of 30-day or 1-year survival following transplantation (C-statistic of 0.520 & 0.518, respectively). SSLR analysis resulted in just two 1-year mortality strata (SSLR 0.89 in the 1st DSRI value decile & 1.06 in the 2nd-10th). Analysis of high-volume centers (>10 LTx per year) revealed substantial variation in the amount of marginal donor transplants by de-identified center.

Conclusions: The factors leading to lung allograft discard are not the same as those leading to beneficial outcomes. This suggests that with proper allocation, grafts that would have been historically discarded could be used in the future donor pool with limited impact on mortality.

Abstract# 96

Perioperative Blood Transfusion is Associated with the Development of New HLA Antibodies After Adult Lung Transplantation

A. Hicks[1], A. Stoker[2], M. Cooter[2], A. Ali[3], J. Klapper[4], J. Poisson[5], D. Chen[5], J. Haney[4], K. Ghadimi[2], M. Hartwig[4], I. Welsby[2], B. Bottiger[2], *[1]Anesthesiology, Duke University Hospital, South Portland, ME, [2]Anesthesiology, Duke University Hospital, Durham, NC, [3]Pulmonology, Allergy and Critical Care Medicine, Duke University Hospital, Durham, NC, [4]Cardiothoracic Surgery, Duke University Hospital, Durham, NC, [5]Pathology, Duke University Hospital, Durham, NC*

Purpose: Lung transplant (LT) recipients who develop new antibodies to human leukocyte antigen (HLA) have associated with chronic lung allograft dysfunction and worsened outcomes. We hypothesized that perioperative transfusion is associated with new HLA antibody formation in the first post-operative year after LT.

Methods: In this single center retrospective cohort study, patients undergoing LT from September 2014 to June 2019 were included. Patients requiring multi-organ, redo LT, pre-operative extracorporeal membrane oxygenation support, or preoperative calculated panel reactive antibody screen >50% were excluded. Patient and procedural characteristics, blood products transfused within 72 hours, and HLA antibody profiles were abstracted from the medical record. The primary outcome was formation of new HLA antibodies within 12 months of transplant. Patients were grouped into those that developed new HLA antibodies ("new HLA") or those that did not change their HLA antibody profiles ("no change") and compared. Secondary outcomes included severe primary graft dysfunction (PGD grade 3), severe acute kidney injury by KDIGO (AKI). These are described by univariate analysis.

Results: Three hundred and twenty-eight patients were included, with 178 in the unchanged group and 150 in the new HLA group. Recipients in the new HLA group had more Caucasian donors, higher baseline cPRAs, different indications for transplant, slightly higher body mass indices, and more postoperative ECMO ***(Figure).*** Compared to the no change group, the new HLA group received more plasma (FFP; 1 [0,3] vs 0 [0,1], p<0.001), and cryoprecipitate (0 [0,2] vs 0 [0,1], p=0.003), while median units of red blood cells and platelets transfused were not statistically different. Total numbers of units transfused were significantly higher in the group with new HLA antibodies (4 [2, 12] vs 3 [1, 6], p=0.007). Patients in the new HLA group had a higher incidence of severe PGD (25% v 15%, p=0.015) and severe AKI (20% v 10%, p=0.019) compared to those in the no change group.

Conclusions: In lung transplant recipients, perioperative transfusion is associated with development of new HLA antibodies within the first year. Newly positive patients had a higher associated incidence of severe PGD and severe AKI.

Abstract# 97

A Randomized, Multicenter, Blinded Study Assessing the Effects of Gaseous Nitric Oxide in an Ex Vivo System of Human Lungs

M. G. Hartwig[1], J. A. Klapper[1], N. Poola[2], A. Banga[3], P. G. Sanchez[4], J. S. Murala[3], J. L. Potenziano[2], *[1]Duke University Medical Center, Durham, NC, [2]Mallinckrodt Pharmaceuticals, Bedminster, NJ, [3]University of Texas Southwestern Medical Center, Dallas, TX, [4]University of Pittsburgh Medical Center, Pittsburgh, PA*

Purpose: The effects of nitric oxide (NO) on donor lungs during ex vivo lung perfusion (EVLP) have not been studied. We assessed whether the novel use of gaseous NO (gNO) in discarded human lungs improved lung health during EVLP.

Methods: This randomized, blinded, parallel, 2-arm, proof-of-concept study compared gNO delivered via the membrane oxygenator on the XVIVO Perfusion System (XPS) (gNO + P) versus the perfusate alone (P). An additional group of lungs were administered inhaled NO (iNO) via the ventilator circuit in open-label fashion (iNO V + P). Enrolled lungs were procured from brain-dead donors that were not suitable for transplantation with or without EVLP. Primary endpoints included a novel grading system for assessing the health of EVLP lungs and total time on EVLP (duration: minimum, 6 hours; maximum, 12 hours). Secondary and exploratory endpoints included clinical assessment of lung suitability for transplantation, left atrium partial pressure of oxygen, change in lung weight, and relevant biomarkers. A Mann-Whitney test was used for between-group comparisons.
Results: A total of 20 bilateral donor lungs (blinded study, n=16; open-label study, n=4) from 3 study centers were enrolled. Overall, lung mean and median grading system scores were generally the same or higher (indicating a better lung health) in the gNO + P group (median score range [min, max], 0-3.5 [0, 7]) versus the P alone group (median score range [min, max], 0-2.0 [0, 5]; *P*>0.12 for all between-group comparisons). In the open-label study, median scores were generally lower in the lungs in the iNO V + P group compared with the gNO + P group. Median (min, max) EVLP time was longer for lungs in the gNO + P group compared with the P alone group (12.4 [8.6, 12.6] vs 10.6 [6.0, 12.4] hours, respectively; *P*=0.01). In the open-label study, median (min, max) EVLP perfusion time was 12.4 (8.7, 13.0) hours in the iNO V + P group versus 12.4 (8.6, 12.6) hours in the gNO + P group (*P*=0.81).
Conclusions: Among lungs deemed unacceptable for transplantation, the addition of gNO to the perfusate was associated with longer stability during EVLP on the XPS system. Our results support further investigation of gNO use during EVLP.

Abstract# 98

Outcomes of Cytomegalovirus Status Determining Induction Therapy in Lung Transplant

K. Heagler[1], J. Lyons[1], B. Bemiss[2], P. Stracener[1], *[1]Pharmacy, Loyola University Medical Center, Maywood, IL, [2]Loyola University Medical Center, Maywood, IL*

Purpose: At the study institution, basiliximab induction is withheld in lung transplant recipients who are cytomegalovirus (CMV) high risk due to concern for increased CMV infection. The purpose of this study was to assess the difference in rate of rejection and CMV infection between basiliximab induction compared to no induction in lung transplant recipients.
Methods: This retrospective cohort study compared adult lung transplant recipients who received basiliximab induction compared to no induction between January 1, 2015 and November 30, 2019. The primary endpoint was incidence of rejection within the first-year post-transplant. Secondary endpoints included patients with clinically significant rejection (ACR Grade A $\geq$ 2 or AMR), patients with greater than one rejection, incidence of CMV viremia, CMV disease, number of clinically significant positive cultures, and death at one-year post-transplant.
Results: A total of 140 patients were included, 97 in the basiliximab group and 43 in the no induction group. Baseline characteristics were similar between the groups as shown in Table 1. Median age was 60 years, 66% were male, and 60% received a bilateral sequential lung transplant (BSL). Primary and secondary endpoint results are displayed in Table 2. Incidence of rejection was numerically higher in the no induction group 26/43 (60.5%) compared to the basiliximab group 46/97 (47.4%) (P = 0.154). Rejection type and severity were similar between the two groups. A significantly higher number of patients had CMV viremia and disease in the no induction group compared to the basiliximab group. There was no difference between the groups in all other secondary endpoints.
Conclusions: Withholding induction therapy in lung transplant recipients due to CMV high risk status resulted in a numerically higher incidence of rejection and did not significantly impact the total number of infections. CMV viremia and disease was significantly higher in the no induction group, which is an expected finding given their CMV high risk status. Notably, a large number of patients in each group were not on prophylaxis at the time of viremia onset. These findings do not provide strong evidence to justify withholding induction based on CMV risk status. A study of direct comparison including CMV high risk patients receiving basiliximab versus no induction would be needed to better assess the impact of induction therapy on the incidence of CMV viremia and disease after lung transplant.

Table 1
Baseline Characteristics

	Basiliximab (n = 97)	No induction (n = 43)	P Value
Age, years [median (IQR)]	59.5 (52.9 – 65.9)	62.5 (53.4 – 57.6)	0.471

VCA: Basic and Clinical

Abstract# 390

A Delphi Panel to Develop Public Educational Materials About Vascular Composite Allotransplantation (VCA)

C. Sidoti[1], A. Ferzola[2], H. Sung[2], S. Rasmussen[2], E. Gordon[3], N. Anderson[3], J. Uriarte[3], C. Cooney[4], G. Brandacher[4], M. Levan[2], *[1]Department of Surgery, Johns Hopkins School of Medicine, East Islip, NY, [2]Department of Surgery, Johns Hopkins School of Medicine, Baltimore, MD, [3]Department of Surgery, Northwestern University Feinberg School of Medicine, Chicago, IL, [4]Department of Plastic and Reconstructive Surgery, Johns Hopkins School of Medicine, Baltimore, MD*

Purpose: As the field of Vascular Composite Allotransplantation (VCA) grows, so does the demand for VCA donations. The education materials about VCA and VCA donation currently accessible to the public are lacking, and there is no consensus on how to best educate the public about VCA.
Methods: We conducted an online Delphi panel with clinical and policy experts in the field of VCA to identify which topics should be presented in educational materials for the public about VCA donation in a comprehensive, relatable, and understandable manner. The modified Delphi method involved two rounds of surveys designed to facilitate consensus within a group. We developed an initial list of topics for inclusion in educational materials based on a previously reported focus group study that assessed information needs when considering VCA donation. Round one assessed the importance of different educational topics using Likert Scale questions. After presenting 29 topics to participants in the first round, we removed topics that had a mean Likert Scale response less than "neutral" and added new topics suggested by experts in the first-round survey. In round two, we presented 27 topics and corresponding educational statements and asked respondents to provide additional feedback on the importance of topics on a Likert Scale. The Likert Scale ranged from "Do Not Include" to "Definitely Include". Responses were analyzed using descriptive statistics.
Results: We received 18 and 15 responses to the first-round and second-round surveys, respectively. Participants were affiliated with institutions across the nation. At the conclusion of the second-round survey, 21 topics had a mean Likert Scale response greater than "Neutral", represented as 3.0 (Table 1). The five most important topics were: potential VCA recipients, the consent process for VCA donation, the definition of VCA, purpose of VCA, and most common VCA organs.
Conclusions: Our findings identified expert-driven topic areas for use in educational materials for the public about VCA. Future research will assess whether these

materials contribute to the public's understanding of VCA and VCA donation. Public education about the opportunity to be a VCA donor is crucial to increasing access to VCA.

Table 1: Topics to Include in Educational Materials

Topic	Mean (SD) Likert Scale Inclusion Response (1 = Do not include, 5 = Definitely Include)
Potential VCA Recipients	4.73 (.57)
Consent Process for VCA Donation	4.73 (.44)
Definition of VCA	4.47 (1.02)
Purpose of VCA	4.47 (.88)
Most Common VCA Organs Transplanted	4.47 (.62)
Authorization Process for VCA Donation	4.33 (.70)
VCA Outcomes	4.27 (1.06)
Presence of VCA in US	4.27 (.85)
VCA Success Stories	4.13 (1.31)
Functionality Return after VCA	4.00 (1.32)

Abstract# 392

Trends in Vascularized Composite Allograft (VCA) Waiting List and Transplant Activity in the U.S

J. Wainright[1], K. Swanner[2], W. Cherikh[1], D. Klassen[3], *[1]Research, UNOS, Richmond, VA, [2]Policy and Community Relations, UNOS, Richmond, VA, [3]Office of the Chief Medical Officer, UNOS, Richmond, VA*

Purpose: Vascularized Composite Allograft (VCA) transplantation has grown and changed rapidly in the past several years. This study investigates VCA waiting list and transplant trends in the U.S.

Methods: We used OPTN VCA waiting list data from July 3, 2014 through November 15, 2020 and OPTN VCA transplant data from January 1, 1998 through November 15, 2020.

Results: Since the OPTN implemented the VCA waiting list on July 3, 2014, 99 candidates have been registered on the waiting list through November 15, 2020. VCA candidates were 60.6% female, 79.8% white, and 78.8% under 45 years old, but characteristics varied by organ type. The size of the VCA waiting list increased gradually over several years, largely due to the introduction of uterus transplants. In the past year, however, existing registrations for upper limb and head and neck candidates held steady while uterus registrations declined. New registrations were notably lower in 2020, likely due to the COVID-19 crisis. As of 11/15/20, the OPTN VCA waiting list included 4 head and neck (20%), 6 upper limb (30%), 4 abdominal wall (20%), and 6 uterus (30%) candidates. Median days on the list for those waiting for a deceased donor organ on 11/15/20 was 771 days (IQR: 524.8 - 971.0) - a large increase compared with analyses at the same time in 2019. Median days on the VCA waiting list for those transplanted with a deceased donor organ was 193 days (IQR: 71.25 - 376.5). A total of 109 VCA recipients have received VCA transplants in the US, including 59 since 7/3/14: 8 bilateral upper limb, 5 unilateral upper limb, 10 face, 1 scalp, 2 abdominal wall, 31 uterus (12 deceased donor; 19 living donor), and 2 penis transplants.

Conclusions: Continued monitoring of VCA trends is needed to support VCA donation and transplantation.

Table 1. Characteristics of VCA Candidates added to OPTN VCA Waiting List between July 3, 2014 and November 15, 2020

Abstract# 393

Utility of Screening-Bead Assay in Post-Transplant Testing of Donor-Specific Antibodies (DSA) and Antibody-mediated Rejection (ABMR) in Renal Allografts

A. Agrawal[1], E. Dijke[2], A. Murray[3], P. Campbell[3], *[1]Transplant Nephrology, Mayo Clinic, Rochester, MN, [2]Lab. Medicine and Pathology, University of Alberta Hospital, Edmonton, AB, Canada, [3]Division of Nephrology, Dept. of Medicine, University of Alberta Hospital, Edmonton, AB, Canada*

Purpose: ABMR is a major cause of poor long-term graft survival. Though post-transplant monitoring of HLA DSAs can aid in risk stratification and optimizing immunosuppression, it is limited by its high cost and lack of data supporting that early detection impacts outcomes. The optimal strategy for testing for DSA is debated. Some centres use screening-bead assays before single-antigen bead (SAB) assays to assess if HLA antibodies are present, believing it is cost-effective. Others forego the screening-bead assay, using the single-antigen bead assay directly, claiming screening is not sensitive enough. We aimed to establish a testing algorithm for HLA antibodies by determining screening's clinical utility.

Methods: Sensitivity (Sn), specificity (Sp), positive/negative predictive values (PPV/NPV) and likelihood ratios (LR+/-) of screening were defined by comparing it to SAB assays as a gold standard for detecting HLA antibodies, and renal biopsies as a gold standard for ABMR. Data were collected from patients between 2013-2017. 688 screens and SABs from 585 patients and 97 screens and biopsies from 87 patients were included. As our study population contained patients investigated for allograft dysfunction, its prevalence of HLA antibodies and ABMR (48.1% and 24.2% respectively) was higher than reported in the general recipient population. Thus, PPV and NPV were extrapolated to the literature-reported prevalence of HLA antibodies (30%), *de novo* DSAs (~15%) and ABMR (~15%).

Results: Sn for HLA antibodies was 90.6% [95% CI: 87.5%, 93.8%], NPV was 75.8% and LR- was 0.345. When extrapolated, NPV was 87.1% for HLA antibodies and 94.2% for *de novo* DSAs. Sn for ABMR was 91.3% [95% CI: 79.8%, 100%], NPV was 82.0% and LR- was 0.70. When extrapolated, NPV was 89.1%. Positive screens had poor clinical utility: Sp for anti-HLA antibodies was 27.2%, 95% CI [22.6%, 31.8%], PPV was 53.6% and +LR was 1.24; Sp for ABMR was 12.5%, 95% CI [4.9% to 20.1%], PPV was 25% and +LR was 1.04.

Conclusions: High Sn and NPV of the screening-bead assay warrant its use in ruling-out anti-HLA antibodies in previously unsensitized renal transplant recipients and those with low clinical suspicion of ABMR. However, it should not be used in pre-sensitized patients or those with high clinical suspicion of ABMR.

Abstract# 394

A Multimodal Interrogation of Human Renal Allografts

D. Dadhania[1], R. Ding[1], H. Xu[2], C. Lee[1], C. Snopkowski[1], T. Salinas[1], T. Muthukumar[1], J. Lee[1], R. Woodward[2], M. Grskovic[2], S. Dholakia[2], M. Suthanthiran[1], *[1]Weill Cornell Medicine - NYPH, New York, NY, [2]CareDx, New York, NY*

Purpose: Development and validation of noninvasive biomarkers of kidney allograft rejection should improve transplant outcomes. CTOT-04 study validated urinary cell mRNA signature (CTOT04-Sig) for T-cell rejection (ACR). Plasma donor derived cell-free DNA (dd-cfDNA) levels were associated with antibody mediated rejection (ABMR) in a multicenter setting. We tested the hypothesis that a composite signature of CTOT04-Sig and plasma dd-cfDNA percentage is diagnostic of AR with high accuracy.

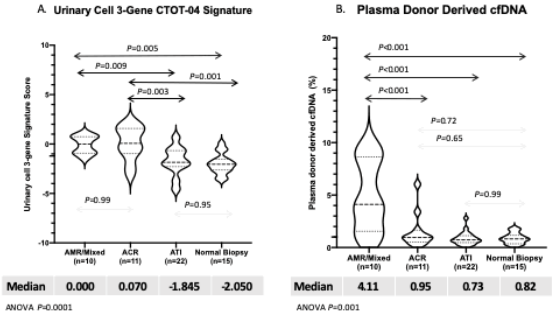
Methods: We profiled biopsy matched 58 urine & plasma specimens from 55 graft recipients: 11 ACR, 10 AMR/mixed rejection, 22 ATI & 15 normal (Nl) biopsies. RNA from urine cell pellets was reverse transcribed to cDNA and customized PCR assays were used to measure CTOT04-Sig consisting of 18S rRNA normalized CD3E mRNA and IP-10 mRNA and 18S rRNA copies. AlloSure measurements were performed by CareDx using a targeted next-generation sequencing assay consisting of 405 single-nucleotide polymorphisms.

Results:

Table 1. Clinical characteristics	AMR or Mixed Rejection (N=10)	ACR (N=11)	ATI (N=22)	Normal (N=15)	P
Patients, N	N=10	N=10	N=22	N=14	
Time since Transplant median (range)	35 (0.9, 75.8)	3.4 (1.3, 7.1)	2.1 (1.4, 5.6)	4.6 (3.3, 13.5)	0.12
Creatinine (mg/dl) at biopsy, mean ± SD	2.40 ±1.16	2.23 ±0.46	4.34 ± 2.48	1.45 ±0.42	<0.001
DSA present at biopsy, N (%)	10 (100%)	0 (0%)	2 (9%)	2 (13%)	0.65
C4d+ biopsy, N (%)	8 (80%)	0 (0%)	0 (0%)	0(0%)	n/a

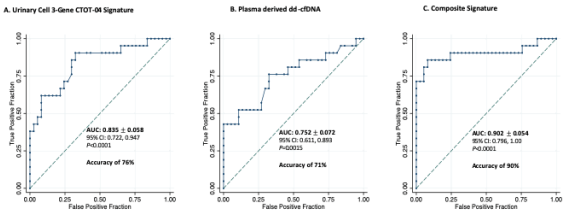
Table 1 is a summary of the study group characteristics.
Violin plots (Fig1A) show that the CTOT04-Sig score is significantly different increased in both ACR and AMR compared to ATI or Nl. dd-cfDNA is significantly increased in AMR vs. ACR, ATI or Nl (Fig1B).

Figure 1. Noninvasive Diagnosis of Acute Rejection in Kidney Allografts



The ability of the signatures to distinguish AR (TCMR + AMR + Mixed) from No AR (ATI+ Normal) was analyzed using receiver operating characteristic (ROC) curves (Fig2). The composite signature had the highest area under the ROC (Fig2C) with a diagnostic accuracy of 90%, outperforming the CTOT04-Sig (P=0.045) and dd-cfDNA (P=0.028).

Figure 2. Receiver Operator Characteristic Curves



Conclusions: Composite signature of CTOT-04 signature and dd-cfDNA allows for accurate and specific diagnosis of AR of kidney allografts and this multimodal approach should be validated in a prospective, multicenter study.

KIDNEY

Abstract# 395

A Patient-Centered Perspective on Progress in Transplantation

B. Hickner[1], N. Galvan[2], R. Cotton[2], C. O'Mahony[2], J. Goss[2], A. Rana[2], *[1]Department of Student Affairs, Baylor College of Medicine, Houston, TX, [2]Department of Surgery, Baylor College of Medicine, Houston, TX*

Purpose: This study aimed to provide a patient-centered perspective on change in transplantation outcomes through analysis of intent-to-treat survival, which accounted for donor shortages by following patients from listing to death regardless of whether a transplant was received.

Methods: The study population consisted of patients in the Organ Procurement and Transplantation Network database listed from January 1, 1990 to December 31, 2019. This included 483,523 patients listed for kidney transplant, 202,096 patients listed for liver transplant, 79,563 patients listed for heart transplant, and 48,680 patients listed for lung transplant. Patients were followed from listing until death or last known follow-up, whether on the waitlist or post-transplant. Cox proportional hazards regression was used to identify clinical and demographic factors associated with intent-to-treat survival. Factors significant in univariate analysis ($p < 0.05$) were included with decade of listing (1990-1999, 2000-2009, 2010-2019) in multivariate regression, with 2010-2019 used as the reference time period.

Results: For all organs, listing from 1990-1999 was associated with highest risk of death and listing from 2010-2019 was associated with lowest risk of death. For kidney transplant, hazard ratios (95% confidence intervals) were 1.43 (1.41-1.45) and 1.04 (1.04-1.05) for 1990-1999 and 2000-2009, respectively. Similarly, liver transplant hazard ratios were 1.30 (1.27-1.32) and 1.09 (1.08-1.10), heart transplant hazard ratios were 1.73 (1.67-1.79) and 1.14 (1.12-1.16), and lung transplant hazard ratios were 1.54 (1.49-1.60) and 1.11 (1.09-1.13). Kaplan-Meier survival curves for abdominal and thoracic organs can be seen in Figure 1 and Figure 2, respectively.

Conclusions: Intent-to-treat outcomes have improved significantly over the last three decades. While all organs displayed improvement in intent-to-treat survival, improvements were most significant in heart and lung transplant. This reflects the combined success of efforts directed at decreasing waitlist mortality, increasing post-transplant survival, and maximizing the respective pools of donor organs.

Abstract# 396

Peripheral Blood Inflammatory Chemokines Uncover Rejection in the Absence of Histological Lesions

E. Van Loon[1], T. Barba[2], B. Lamarthée[1], A. Senev[1], O. Thaunat[2], D. Schols[3], M. Naesens[1], *[1]Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium, [2]Department of Transplantation, Nephrology and Clinical Immunology, Edouard Herriot Hospital Lyon, Lyon, France, [3]Laboratory of Virology and Chemotherapy, KU Leuven, Leuven, Belgium*

Purpose: Cytokines and chemokines play a critical role in the pathophysiology of allograft rejection, but the relation of peripheral blood cytokine expression profiles to clinical kidney transplant rejection is insufficiently investigated.

Methods: Levels of 28 cytokines, chemokines and growth factors were assessed using multiplexed Luminex magnetic bead testing in 293 peripheral blood samples. Blood samples were collected between 2012 and 2016, at time of a kidney allograft biopsy for graft dysfunction within the first year after transplantation in a cohort of 192 consecutive transplants at a single kidney transplant center.

Results: Principal component analysis and hierarchical clustering uncovered two clusters, distinct in their pro-inflammatory cytokine levels (Figure a). Patients in Cluster I (N=20) had higher pro-inflammatory protein expression compared to patients in cluster II (N=172) and were hallmarked by high prevalence of donor-specific anti-HLA antibodies (HLA-DSA) (N=15/20) (Figure b), and high acute inflammatory histological lesion scores. In 30% (N= 6/20) of biopsies in cluster I, there was no histological evidence of rejection. Cluster I had worse graft survival independent of female sex, repeat transplantation, induction therapy and ongoing histological rejection (adjusted hazard ratio 3.31, 95% CI 1.09 -10.03, p=0.03). The observed inflammatory cytokine profiles were confirmed in *in vitro* models of DSA-mediated NK cell and/or monocyte activation.

Conclusions: The expression of pro-inflammatory cytokines is increased in peripheral blood of kidney transplant patients with circulating HLA-DSA, even in the absence of histopathology of rejection. These results challenge the vision that kidney transplant histology is the gold standard for identification of ongoing allo-immune processes.

Kidney

Kidney Deceased Donor Allocation 1

Abstract# 398

Donor-Recipient BSA Matching is Prognostically Significant in Solitary and En-bloc Kidney Transplantation from Pediatric Circulatory Death Donors

C. J. Little, A. A. Dick, J. D. Perkins, J. D. Reyes, *Department of Surgery, University of Washington, Seattle, WA*

Purpose: The purpose of this study was to evaluate the pernicious effects of inadequate functional nephron mass in size disparate donation after cardiac death (DCD) kidney transplantation between pediatric donors and adult recipients by characterizing the impact of donor-recipient (D-R) body surface area (BSA) mismatch on long-term graft and patient survival.

Methods: Utilizing the Organ Procurement and Transplantation Network (UNOS) database, a retrospective analysis was performed for all adult (18 years or older) recipients of pediatric (17 years or younger) DCD kidneys in the US from 1/1/2004-

3/10/2020. The primary outcomes included death-censored graft survival, all-cause graft survival, and patient survival. The cohorts were defined by D-R BSA ratios of 0.10-0.70, >0.70-0.91, and >0.91.

Results: Solitary DCD pediatric allografts transplanted between D-R pairs with a BSA ratio of 0.10-0.70 carried an increased risk of all-cause graft failure (RR 1.36; CI 1.10-1.69) and patient death (RR 1.32; CI 1.01-1.73) when compared to pairings with a ratio of >0.91. There was no difference in death-censored graft survival between these cohorts. Additionally, there was no difference in graft or patient survival between the >0.70-0.91 and >0.91 cohorts. Kaplan-Meier survival analysis revealed improved 10-year patient survival in recipients of en-bloc allografts (P = 0.02) compared to recipients of single kidneys with D-R BSA ratios of 0.10-0.70. A similar survival advantage was demonstrated in recipients of solitary allografts with D-R BSA ratios >0.70 (P = 0.02).

Conclusions: Donor-recipient size disparity is associated with inferior patient and all-cause graft survivals, which can be overcome by appropriate BSA matching or en-bloc transplantation. The deleterious effects of mismatched D-R BSA ratios are likely attributed to the well described systemic sequelae of insufficient renal functional capacity. Therefore, D-R BSA matching is prognostically significant when considering allocation strategies for DCD kidneys from pediatric donors. Specifically, a D-R BSA ratio of >0.70 represents the safe lower limit for solitary kidney transplantation, while a ratio of 0.10-0.70 serves as criteria for en-bloc allocation.

Abstract# 399

Characterizing the Early Impact of the Kidney Accelerated Placement Project on Hard-to-place Kidneys

J. D. Motter, A. Kernodle, M. Levan, D. Segev, J. Garonzik-Wang, A. Massie, *Johns Hopkins University, Baltimore, MD*

Purpose: In 2019, the OPTN implemented the Kidney Accelerated Placement Project (KAPP) in an effort to increase the utilization of kidneys with a high Kidney Donor Profile Index (KDPI, 80-100%). This one-year pilot program accelerated the national-level offers for these hard-to-place kidneys first to programs with historic likelihood of acceptance. We sought to characterize KAPP's early impact on center-level acceptance practices, cold-ischemia time (CIT), and discard rate of high KDPI kidneys.

Methods: We conducted a quasi-experimental, difference-in-differences (DID) analysis using SRTR data from 07/18/2018-07/17/2019 (pre-KAPP) and 07/18/2019-01/06/2020 (post-KAPP). We used negative binomial regression to quantify the change in center refusals for high KDPI donors across eras. We then explored changes in CIT using log-linear and hierarchical logistic regression, accounting for center- and OPO-level variation, respectively.

Results: We identified 211 centers who were offered kidneys from 4499 high KDPI donors, of whom 1601 donors were offered post-KAPP. The median number of center refusals for high KDPI donors decreased from 2 (IQR: 0,5) pre-KAPP to 1 (IQR: 0,4) post-KAPP (p<0.001) (Figure). The proportion of donors with ≥10 center refusals decreased from 11% pre-KAPP to 6% post-KAPP (p<0.001). This translated into 14% fewer (IRR: $_{0.79}0.86_{0.94}$, p=0.002) center refusals for high KDPI kidneys post-KAPP compared to pre-KAPP, and 16% fewer (DID IRR: $_{0.74}0.84_{0.95}$, p=0.004) overall refusals between eras. However, there was no evidence of change in the discard rate across eras (DID OR: $_{0.76}0.88_{1.02}$, p=0.1). Conversely, CIT for high KDPI kidneys decreased by 4% (RR: $_{0.73}0.96_{0.99}$, p=0.1) post-KAPP compared to pre-KAPP, and 4% overall (DID RR: $_{0.92}0.96_{1.00}$, p=0.03) between eras.

Conclusions: Following the implementation of KAPP, there were fewer offers of high KDPI kidneys to centers that did not want them, reducing administrative burden for centers and OPOs. However, CIT decreased slightly, and there was no change in the discard rate.

Abstract# 400

Comparison of Outcomes of Hepatitis C Virus (hcv) Nucleic Acid (nat) Positive Donor Between Hcv-naïVe and Hcv + Recpients - A Donor Mate Analysis

J. Kamal, B. Sharma, A. Doyle, A. Kumar, A. Nishio-Lucar, S. Rao, *University of Virginia, Charlottesville, VA*

Purpose: Despite a growing mismatch between organ need and supply, organs from HCV+ donors were only offered to HCV+ recipients (HCV R+) to avoid complications of de novo hepatitis. The advent of highly effective direct-acting antivirals, has ushered in a new era where kidneys from HCV+donors can be safely transplanted into HCV naïve recipients (HCV R-). We sought to evaluate the outcomes of the recipients at highest risk of HCV transmission (HCV NAT +/R-) compared to those at lowest risk (HCV NAT+/R+) by conducting a mate kidney analysis of same HCV NAT+ donors.

Methods: We analyzed data from the Organ Procurement and Transplantation Network database with transplant outcomes up till 12/2019. Sixty-two HCV NAT+ donors donated both kidneys to HCV-discrepant recipients.

Results: The first eligible donor was identified in 2017. Thereafter, a steep increase occurred in 2018 with 32 such pairs transplanted. Mean donor age was 32 ±7 y, 37% were women, and 4% were of Black race. Majority were donors after brain death (85%) with mean KDPI of 44 and optimized KDPI of 20.Recipients in the 2 groups were similar in most respects, with a mean age of 58 ± 9 y, 74% males, 47% Black and, 15% had prior transplant. Diabetes mellitus (37%) was the most common cause of end-stage kidney disease and 87% were on dialysis prior to transplant. While the dialysis vintage time was similar in both groups (2.7 y), the time of listing to transplant was shorter in the HCV R+ cohort (42 vs 604 d, p<0.001), reflecting the possible update of acceptance criteria of the HCV R- in order to avail of HCV NAT + donors. The relatively short cold ischemia time (17 hours) and the low rates of delayed graft function (4.9%) is indicative of very selective HCV NAT + donors being considered for kidney donation. Median follow-up was 216 days with similar outcomes (graft and patient survival) in both groups (Figure 1). R HCV status did not correlate with patient or graft survival.

Conclusions: Recipients who are at higher risk from HCV transmission, achieved an excellent short term patient and graft survival, similar to the HCV R+. While we were unable to analyze HCV treatment information due to the nature of the registry dataset, it is highly probable that successful HCV therapy post-transplant was the equalizing factor. The similar recipients characteristics in both cohorts reflects a uniform approach in picking eligible recipients of HCV + organs, regardless of recipient status. In conclusion, the use of HCV NAT + kidneys in HCV naive recipients appears to be a safe and should be promoted.

Abstract# 401

Centers Avoided 67% of Kidney Offers by Participating in the OPTN's Multifactorial Offer Filter Pilot Project

A. Toll, H. McGehee, D. Stewart, R. McTier, *Research, United Network for Organ Sharing, Richmond, VA*

Purpose: Evaluate if multifactorial filters can reduce unwanted kidney offers to centers, thereby reducing administrative burden and getting to the accepting candidate quicker.
Methods: 40 centers participated in the second phase of the OPTN Offer Filters Pilot which ran from August 26, 2020 to December 2, 2020. The OPTN pre loaded a set of machine learning-derived recommended filters for each center prior to the start of the pilot. Recommended filters were derived using recursive partitioning trees based on centers' 2018-2019 acceptance practices and included donor profiles for which a center received offers from at least 20 donors with 0 acceptances. Centers were also able to create their own custom multi-factorial filters to reduce unwanted kidney offers. New in this phase, centers could exclude specific candidate groups from their filters (high CPRA, 0-ABDR mismatch, age limits). Additionally this phase introduced the ability to turn filters "on" to actually avoid receiving offers meeting filter criteria.
Results: Over the course of the study OPOs attempted to send 368,508 offers from 2,983 unique donors to the 40 pilot centers. The set of recommended filters pre-loaded at the start of the pilot, had the potential to bypass 59% of those offers (48% of the donors at centers). Of the pilot centers, 26 elected to turn on bypassing for at least one filter. OPOs attempted to send 308,335 offers from 2,532 unique donors to these 26 centers. The centers' bypass filters removed 206,933 (67%) offers. Individual center impacts ranged from 0% to 94% of offers filtered. Modeling closely predicted center performance (Fig 1A) despite centers not always using the set of pre-loaded recommended filters. Success in bypassing a large volume of offers was not associated with the number of filters turned on or the origin of filters (recommended vs custom). Of the 91 filters turned on for bypassing, 49 included candidate exclusion criteria. Some centers were very effective at filtering offers even from a small percentage of donors (Fig 1B).
Conclusions: The Offer Filters Pilot demonstrated both the potential of multifactorial filters to reduce unwanted organ offers and the willingness of centers to turn these filters on for bypassing. Candidate exclusion criteria provide protections to centers hesitant to turn on filters that would apply to their entire list. A national implementation could save centers administrative time, decrease allocation time, reduce cold ischemic time, and help avoid discard.

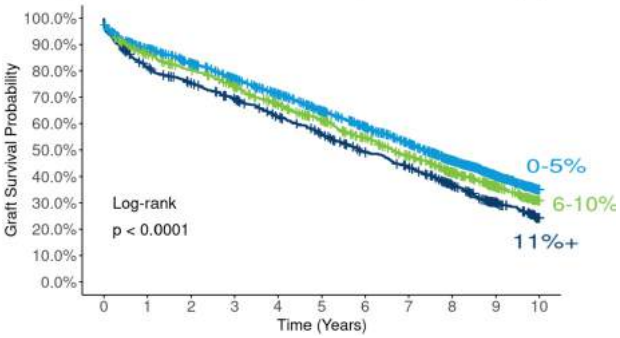
Abstract# 402

Can Procurement Biopsy Data Tell Us Anything? The Influence of Glomerulosclerosis on Long-term Kidney Graft Survival

D. Stewart[1], L. Kamal[2], J. Foutz[3], H. McGehee[3], P. Saravanane[2], S. Yu[2], R. Yousfi[2], G. Gupta[2], *[1]United Network for Organ Sharing, Richmond, VA, [2]Virginia Commonwealth University Health, Richmond, VA, [3]Research, United Network for Organ Sharing, Richmond, VA*

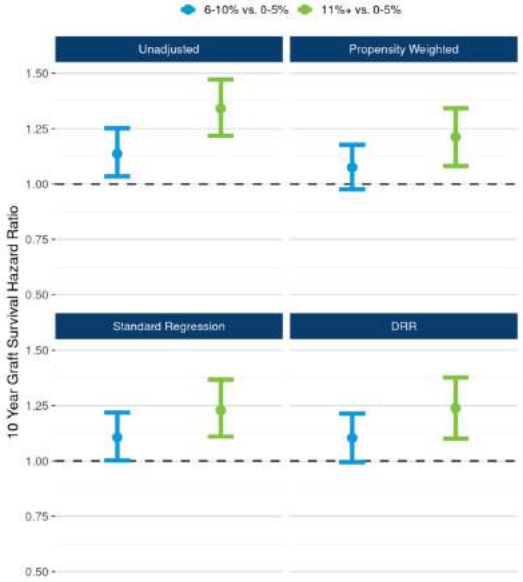
Purpose: Biopsy findings, particularly % glomerulosclerosis, have been shown to have a profound impact on kidney utilization decisions. Most studies of the association between procurement biopsy findings and kidney recipient outcomes have been limited in scale and focused on short-term survival. With a goal of aiding transplant decision-making, the "BARETO" (Biopsy, Anatomy, and Resistance Effects on Transplant Outcomes) national registry study unlocks previously trapped biopsy and anatomy data on DonorNet attachments to assess relationships between these findings and long-term renal graft outcomes.
Methods: Data were manually entered for a preliminary cohort of 4,473 ECD donor solitary kidney transplants from 2008-2011. Kaplan-Meier graft (all-cause, death-censored) and recipient survival analysis out to 10 years was stratified by degree of glomerulosclerosis (GS). Causal inference was performed using propensity-weighted, multivariable, and doubly robust regression (DRR) Cox modeling to adjust for 18 potential confounders.
Results: Survival analysis revealed an unequivocally significant ($p<0.0001$) association between GS and all-cause graft survival probability (Fig 1).

Fig 1. Ten-Year All-Cause Graft Survival by Glomerulosclerosis (%)



The graft failure hazard ratio for GS 11%+ vs. 0-5% (HR 1.34, 95% CI: 1.22, 1.47) was only moderately attenuated after DRR risk-adjustment (HR 1.24, 95% CI: 1.10, 1.38). (Fig 2)

Fig 2. All-Cause Graft Failure Hazard Ratios by Glomerulosclerosis



Considered as a linear effect, the DRR risk-adjusted graft failure hazard ratio per each 5% rise in GS was 1.02 (0.99, 1.07).
Conclusions: Despite questions about reliability and interpretation of procurement biopsies, GS as reported in DonorNet is highly associated with long-term graft outcomes. A dose-response relationship is evident, but further BARETO study data will help more precisely establish the nature of the effect beyond GS of 10%. Once established, incorporating GS as one component of a multifactorial composite donor score (e.g., KDRI) has the potential to improve organ offer decision-making and temper the impact of biopsy findings on the kidney discard rate.

Abstract# 403

Clinical Features and Outcomes of Candidemia in Patients with Left Ventricular Assist Devices

G. Krishnan, Y. Hamad, I. George, *Infectious Diseases, Washington University School of Medicine, St Louis, MO*

Purpose: Fungal infections represent an uncommon etiology of Left Ventricular Assist Device (LVAD) infections but can lead to significant morbidity and mortality. In this study, we sought to examine the clinical features and outcomes of candida blood stream infection (candidemia) in patients with LVADs.

Methods: We retrospectively analyzed all adult patients with LVAD who developed candidemia at a tertiary academic center from 01/2010 to 08/2020. Primary end points were thirty-day mortality, six-month mortality and recurrence of infections. Univariate Chi-square and Fischer's exact test were used for categorical variables and t-test for continuous variables.

Results: Among 41 LVAD patients with candidemia, 11 (26.8%) experienced the first episode of candidemia within 30 days and 21 (51.2%) had the first episode within the 100 days after LVAD placement. Sepsis with septic shock was the most common presentation (21/41, 51.2%) and C. *parapsilosis* was the most common species isolated (17/41, 41.5%). Large proportion required ICU admission (78%) and had underlying Chronic Kidney Disease (66.7%). Heartmate2 (23/41, 56.1%) was the most common LVAD in these patients followed by Heartware (9/41, 22.0%). Most patients (97.5%) had antibiotic exposure in the 30 days preceding candidemia. Micafungin was the most used initial antifungal therapy (30/41, 73.2%). Overall mortality in patients with candidemia was 80.5% with 36.6% and 53.7% mortality within 30 days and 6 months of candidemia, respectively. Among 19/41 patients who survived till 1 year, candidemia recurrence occurred in 9/19 (47.3%). Risk factors for 30-day mortality were older age (p=0.08), initial clinical presentation of sepsis with septic shock (p=0.03) or stroke with embolic phenomenon (p=0.05) and need for Intensive Care Unit (ICU) admission (p=0.02). Risk factors for 6 months mortality were older age (p=0.03), male gender (p=0.05), and diabetes mellitus (p=0.06). Chronic antifungal suppression after initial treatment was associated with lower 6 months mortality (p= 0.001). Median time to onset of candidemia from LVAD placement was 48 days among people who died at 6 months and 341 days for the survivors.

Conclusions: This is the largest single-center study analyzing candidemia in LVAD patients to date. Candidemia is associated with high mortality and high rate of recurrence in survivors. Earlier onset of candidemia after LVAD placement is associated with higher mortality. Older age, male gender and need for ICU admission are significant risk factors for candidemia-associated mortality in LVAD patients.

Abstract# 404

Significance of Repeated 1r Rejections in Heart Transplantation

C. Hsueh[1], L. Wilson[2], L. Bow[2], L. Bellumkonda[2], *[1]Yale New Haven Hospital, New Haven, CT, [2]Yale University School of Medicine, New Haven, CT*

Purpose: 1R rejection is commonly seen in routine post-transplant biopsies. While presence of occasional 1R rejection is not considered to be detrimental, the significance of repeated 1R rejection is not well studied.

Methods: We conducted a retrospective analysis of patients transplanted at our center, between July 2008 and December 2014. A total of 1,128 biopsies were performed in 69 patients. Each patient on an average had 16 biopsies.

Results: 14 patients had grade 0 on all their biopsies, 22 had grade 1 on one or two of their biopsies, 30 had grade 1 on three or more of their biopsies. Three patients had grade 2 on their initial biopsy and were excluded from the study. Baseline characteristics are summarized in the table. Compared to grade 0, presence of grade 1 rejection and repeated occurrence of grade 1 rejection, did not predict increased risk of mortality or progression to grade 2 or grade 3 rejection. Grade 1 rejection and repeated occurrence of grade 1 rejection did not predict development of de novo donor specific antibodies or graft failure as defined by decrease in ejection fraction to less than 55%.

Conclusions: Grade 1 rejection or presence of repeated grade 1R was not associated with adverse outcomes. There was no difference in subsequent grade 2 or grade 3 rejection, development of de novo donor specific antibodies, graft failure and mortality in patients with grade 1 compared to grade 0 rejection.

Abstract# 405

When is the Optimal Time to Initiate the Renal-Sparing Protocol with Calcineurin Inhibitor Withdrawal?

N. Patel, M. Kittleson, J. Patel, T. Singer-Englar, S. Kim, D. Chang, B. Azarbal, A. Nikolova, L. Czer, F. Esmailian, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

Purpose: Renal dysfunction after heart transplantation (HTx) has been associated with higher morbidity and mortality. The most common cause of this renal dysfunction is the use of calcineurin inhibitors (CNIs). Many programs will utilize a renal sparing protocol (RSP) after 6-months post-transplant whereby the CNI is tapered off with the addition of a proliferation signal inhibitor added to the pre-existing mycophenolate mofetil. It is believed that weaning RSP earlier during renal dysfunction leads to better outcome. We sought to answer this question with review of our RSP experience.

Methods: Between 1994-2017, we assessed 61 heart transplant patients with elevated creatinine. RSP was started at creatinine 1.5-2.0, 2.1-2.5, and 2.6-3.0 mg/dL. Renal function was measured by serum creatinine and glomerular filtration rate (GFR) at 6- and 12-months following initiation of RSP.

Results: RSP initiated at the lowest elevation of serum creatinine resulted in a higher GFR compared to RSP at higher ranges. However, the overall improvement from baseline was similar (change in GFR around 9 cc/min., see table). The average time between transplant and initiation of RSP was 5.3 ± 4.2 years.

Conclusions: RSP performed at earlier rising serum creatinine appears most beneficial in terms of restoring optimal kidney function.

Endpoints	Creatinine 1.5-2.0 mg/dL (n=21)	Creatinine 2.1-2.5 mg/dL (n=22)	Creatinine 2.6-3.0 mg/dL (n=18)	P-Value
Serum creatinine @ RSP initiation	1.80 ± 0.18	2.28 ± 0.13	2.75 ± 0.12	<0.001
Serum creatinine 6 months after RSP initiation	1.58 ± 0.39	1.85 ± 0.35	2.21 ± 0.52	<0.001
GFR @ RSP initiation	37.91 ± 5.40	29.28 ± 3.59	22.99 ± 2.51	<0.001
GFR 6 months after RSP initiation	46.99 ± 15.42	38.88 ± 9.98	31.24 ± 7.80	<0.001
ΔGFR (% change)	9.08 ± 13.44 (23.95%)	9.60 ± 9.19 (32.79%)	8.25 ± 7.56 (35.89%)	0.921

Abstract# 406

Are Pre-Transplant Diabetics on ACE Inhibitors at Risk for More Renal Dysfunction After Heart Transplantation?

M. Kittleson, J. Patel, D. Chang, N. Patel, S. Kim, T. Singer-Englar, R. Skorka, A. Hage, L. Czer, F. Esmailian, J. A. Kobashigawa, *Cedars-Sinai Smidt Heart Institute, Los Angeles, CA*

Purpose: Diabetic patients undergoing heart transplantation may be at greater risk of developing kidney dysfunction after heart transplantation due to calcineurin inhibitor (CNI) nephrotoxicity. It is not known whether diabetes in patients who have normal kidney function at the time of transplant are at greater risk of developing kidney dysfunction after heart transplantation compared to non-diabetic patients. Furthermore, it is not known whether the addition of angiotensin-converting enzyme inhibitors (ACEi) can ameliorate the development of proteinuria in these diabetic patients compared to those without diabetes.

Methods: Between 2010 and 2019, we assessed 34 heart transplant patients who had pre-transplant diabetes with normal kidney function (creatinine <1.3) at the time of transplant and were placed on an ACEi within 3 months of transplant for a minimum of 1 year. Comparison groups included pre-transplant non-diabetic patients on ACEi (n=66), pre-transplant diabetic patients not on ACEi (n=81), and pre-transplant non-diabetic patients not on ACEi (n=147). For all groups, renal function was measured by serum creatinine at 1 year post-transplant. 1-year freedom from proteinuria was also assessed.

Results: Pre-transplant diabetic patients not on ACEi had the greatest rise in creatinine at 1 year compared to the other groups (see table). 1-year freedom from proteinuria was not significantly different among the study groups.

Conclusions: The addition of ACEi in pre-transplant diabetic patients may be protective against CNI nephrotoxicity. Further studies will need to be done to confirm these findings.

Endpoints	Pre-Transplant Diabetic Patients on ACEi (n=34)	Pre-Transplant Non-Diabetic Patients on ACEi (n=66)	Pre-Transplant Diabetic Patients not on ACEi (n=81)	Pre-Transplant Non-Diabetic Patients not on ACEi (n=147)	P-value
Creatinine @ Transplant	1.06 ± 0.21	1.00 ± 0.24	1.08 ± 0.23	1.05 ± 0.22	0.220
Creatinine @ 1 Year	1.15 ± 0.40	1.00 ± 0.29	1.32 ± 0.93	1.08 ± 0.37	0.002
1-Year Freedom from Proteinuria	73.5% (9)	74.2% (17)	76.5% (19)	70.1% (44)	0.730

Abstract# 407

Management of Drug Interactions During Protocolized Implementation of Posaconazole Immediately Post Heart Transplant

G. Waldman, C. Rogers Marks, J. Clark, A. Woo, L. Irwin, A. Gerlach, G. D. Lewis, J. A. Fishman, *Massachusetts General Hospital, Boston, MA*

Purpose: Posaconazole (POSA) is a strong CYP3A4 inhibitor known to increase tacrolimus exposure by up to 4-fold. Initiation requires empiric tacrolimus dose adjustment and close monitoring upon discontinuation (d/c) to avoid low levels that may contribute to graft rejection. We describe our experience with a posaconazole prophylaxis protocol (PPP) in heart transplant recipients receiving tacrolimus.

Methods: All patients at our center who received an orthotopic heart transplant patients (OHT) after September 2019 were enrolled in the PPP. POSA was typically initiated within the first 3 days post-operatively with doses adjusted to maintain a target trough of 1000-2000 ng/mL for 3 months. Patients unable to swallow the oral delayed release formulation received the intravenous formulation. At the time of POSA d/c, tacrolimus doses were doubled with bi-weekly monitoring to maintain goal levels.

Results: 50 patients underwent OHT with PPP. Four patients were not initiated on POSA due to drug-drug interactions. Of the 46 patients included in analysis, 18 (39%) experienced a tacrolimus level > 15 ng/mL within the first 7 days of POSA initiation. Early discontinuation was necessary in 15% of patients (Table 1). Therapy was extended beyond 3 months in 3 patients due to rejection episodes necessitating pulse steroids. Six (15%) patients experienced ≥2R rejection within one month of POSA d/c. Half of these patients had no prior rejection episodes, while half had prior rejection with a negative biopsy immediately prior to the 2R diagnosis. Four (66%) of these patients had subtherapeutic tacrolimus levels at time of rejection. No patients have experienced fungal infections since initiation of PPP.

Conclusions: Use of PPP in the first 3 months after heart transplant can be used to prevent fungal infections; however, this practice requires close monitoring upon discontinuation to prevent low tacrolimus levels that may contribute to rejection risk.

Table 1: Results

Baseline Characteristics (N=50)

Abstract# 408

Do Pretransplant C-peptide Levels Influence Outcomes in Simultaneous Pancreas-Kidney Transplantation? A Matched Case-Control Study

K. B. Gurung, V. Gurram, J. Rogers, A. C. Farney, G. Orlando, C. L. Jay, A. Reeves-Daniel, A. Mena-Gutierrez, N. Sakhovskaya, W. Doares, S. Kaczmorski, M. D. Gautreaux, R. J. Stratta, *Abdominal Transplant Surgery, Wake Forest Baptist Medical Center, Winston-Salem, NC*

Purpose: Experience with simultaneous pancreas-kidney transplant (SPKT) in uremic patients (pts) with detectable pretransplant C-peptide (Cp) levels and a "type 2" diabetes mellitus (DM) phenotype have demonstrated survival outcomes equivalent to those with type 1 (Cp negative) DM. The study purpose was to evaluate outcomes in SPKT recipients according to presence or absence of pretransplant Cp in a case-control fashion.

Methods: Selection criteria for Cp positive (Cp+, ≥2.0 ng/ml) were similar to Cp negative (Cp-) pts. We retrospectively analyzed 215 SPKTs performed at our center between 8/02 - 5/19 and identified 41 pts who were Cp+ pretransplant (mean level 5.4 ng/ml) and compared to 41 Cp- (level undetectable) case controls matched for recipient age, gender, race, and date of SPKT. All SPKTs were performed as intent to treat with portal-enteric drainage; all pts received depleting antibody induction with FK/MMF ± steroids. Pancreas graft failure (GF) was defined as return to daily insulin therapy and kidney GF as need for dialysis.

Results: Mean follow-up was 7.8 years. The 2 groups were well-matched for numerous donor, preservation, recipient, and immunological characteristics. Mean donor (26 Cp+ vs 23 years Cp-) and recipient (both 44 years) ages were similar. Both groups had 21 males/20 females and 19 Caucasian/20 African American/2 Hispanic pts. There was one early death secondary to infection in each group. There were no other early (<6 month) kidney GFs but there were 5 other early pancreas GFs, 3 in Cp+ and 2 in Cp- pts. 5-year pt survival (PS, 93% vs 95%), kidney graft survival (GS, 73% vs 85%), and pancreas GS (68% vs 85%, p=0.11) rates were slightly lower in Cp+ vs Cp- pts, respectively. Death-censored kidney (69% vs 73%) and pancreas GS (59% vs 81%, p=0.07) rates were also slightly lower in Cp+ vs Cp- pts, respectively. The Cp+ group had fewer deaths with functioning grafts (9.8% Cp+ vs 19.5% Cp-, p=NS) but more pancreas GFs due to either insulin resistance (9.8% Cp+ vs 0 Cp-, p=0.12) or rejection (19.5% Cp+ vs 12% Cp-, p=NS). There were no differences in outcomes according to gender or race. Post-SPKT weight gain >5 kg occurred in 76% of Cp+ vs 32% of Cp- pts (p=.0001). Mean post-SPKT weight gain was 15 kg in Cp+ vs 6.5 kg in Cp- pts (p<.001). In pts with functioning grafts, mean post-SPKT Cp (4.9 vs 2.6 ng/ml), HbA1c (5.5 vs 5.2%) and serum creatinine (1.4 vs 1.2 mg/dl) levels were slightly higher in Cp+ pts whereas mean eGFR levels (61 vs 66 ml/min/1.73 m^2) were slightly lower compared to Cp- pts.

Conclusions: In this matched case-control study, medium-term survival and functional outcomes in pretransplant Cp+ pts are slightly inferior following SPKT, with more post-SPKT weight gain and pancreas GF due to either insulin resistance or rejection in Cp+ pts accounting for differences in outcomes.

Abstract# 409

Peri-covid Trends on the Intestinal Transplant Waiting List

M. L. Samoylova[1], S. Jafri[2], M. I. Fiel[3], S. Horslen[4], A. Mavis[5], T. Schiano[6], B. Summers[7], M. C. Segovia[8], *[1]Surgery, Duke University, Durham, NC, [2]Gastroenterology and Hepatology, Henry Ford Hospital, Detroit, MI, [3]Pathology, Mount Sinai, New York, NY, [4]Transplantation, Seattle Children's Hospital, Seattle, WA, [5]Pediatric Gastroenterology, Duke University, Durham, NC, [6]Hepatology, Mount Sinai Medical Center, New York, NY, [7]Pharmacy, Henry Ford Hospital, Detroit, MI, [8]Gastroenterology, Duke University, Durham, NC*

Purpose: We aim to describe the trends in intestinal and multivisceral transplant waiting list activity and outcomes before and after the COVID-19 pandemic.

Methods: We used the cohort of intestinal and multivisceral transplant candidates who were on the waiting list November 1, 2020 - June 12, 2020 as recorded in the UNOS STAR files pulled on June 12, 2020. March 1, 2020 was considered "post-COVID." We used the INTESTINE_WLHISTORY_DATA file to evaluate the frequency of waitlist additions, modifications, and removals over time. Monthly regional Expected events were calculated using the average monthly number of events February 2019-February 2020, and compared to monthly regional Observed events during March 2020-May 2020

Results: In the four months pre-COVID, 193 changes were made to the intestine waiting list, compared with 257 post-COVID. One center reported a dramatic increase in waiting list activity in May 2020, with high activation & inactivation of candidates. All other centers combined exhibited a decrease in intestinal transplant waitlist additions and activations post-COVID. Observed:Expected ratios (O:E) for waitlist activity and transplants stratified by intestine-only and multivisceral candidates are shown in **Figure 1.** Regions 6 and 7 had no recorded multivisceral waiting list additions, removals, or modifications after March 1, 2020. After March 1, 2020, most regions performed fewer transplants, with a minority increasing their monthly transplant volume. National monthly transplant rates remained stable. **Figure 2.** There were very few waiting list deaths, with only two recorded post-COVID.

Conclusions: Though most regions reduced intestinal and multivisceral transplant volumes after March 1, 2020, national transplant rates remained stable demonstrating significant regional variation in COVID-19 effect on practice.

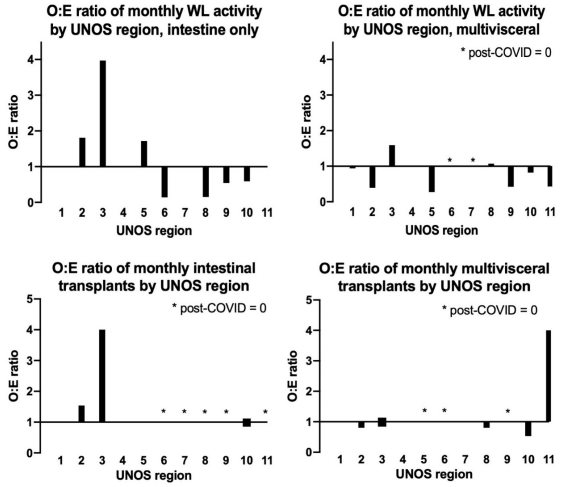

Figure 1. Observed : Expected ratios of monthly waitlist activity and transplants by UNOS region, March – May 2020.

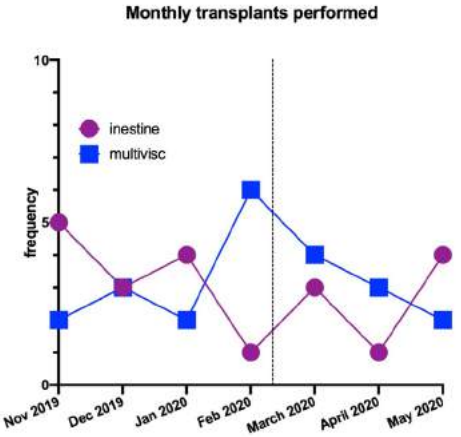

Figure 2. Monthly intestine-only and multivisceral transplants performed, November 2019 – May 2020.

Abstract# 410

Prevalence of Diabetic Changes on Kidney Allograft Biopsies of Normoglycemic Simultaneous Pancreas-Kidney Transplant Recipients

C. Mejia, G. Giannini, D. C. Brennan, A. Rosenberg, S. Alasfar, *Johns Hopkins University, Baltimore, MD*

Purpose: Small studies suggest that achieving normoglycemia with simultaneous pancreas-kidney transplant (SPK) prevents the development of diabetic nephropathy (DN) among type 1 diabetics (T1DM). However, hemodynamic pathways, profibrotic cytokines, and genetic predisposition also contribute to the pathogenesis of DN and may not be reversed by an SPK. We sought to determine if diabetic changes (DC) occur in kidney graft biopsies of normoglycemic SPK recipients.
Methods: We conducted a retrospective review of medical records of all SPK recipients at our center from 1996-2019. For our analysis, we included recipients with at least 1 kidney graft biopsy ≥ 6 months after SPK and a functioning pancreas at the time of biopsy (defined as having a hemoglobin A1c < 6.5% without oral hypoglycemic agents or chronic insulin use). Our primary outcome was the prevalence of early structural DC namely glomerular basement membrane thickening and/or mesangial matrix expansion. Secondary outcomes included kidney graft outcomes. We expressed categorical data as absolute numbers (%) and continuous data as medians (interquartile range, IQR).
Results: Of 150 T1DM SPK recipients, 43 had a kidney graft biopsy. 23 (53%) met inclusion criteria. Most of those excluded had pancreas failure. Baseline characteristics are shown in Table 1. 14/23 recipients (61%) had a biopsy showing early DC at a median of 34.5 months (18.7-101.7) after SPK. 5 (22%) had DN as part of the final pathologic diagnosis (median of 42 months after SPK, IQR 36-134). At the time of the first biopsy with DC, median serum creatinine was 1.7 mg/dl (1.35-2.24) and hemoglobin A1c was 5.4% (5.2-5.9). Median kidney graft follow-up was 102 months (60.5-159). During follow-up of the 14 recipients with DC, 8 (57%) had acute cellular rejection, 2 (14%) had antibody mediated rejection, and 8 (57%) progressed to kidney graft failure. Graph 1 shows the difference of kidney graft survival between recipients with DC versus those without.
Conclusions: This is the first study that shows that DC (61%) and DN (22%) can recur after SPK despite good glucose control and is seen relatively early after transplant. This suggests that other mechanisms contribute to the development of DN after SPK.

Table 1. Baseline recipient and donor characteristics (n= 23)

Abstract# 411

Evaluation of Preperitoneal Space as an Extrahepatic Transplant Site in Clinical Total Pancreatectomy with Islet Autotransplantation

K. Kumano, B. Naziruddin, S. Bruer, G. Saracino, M. Lawrence, G. Testa, A. Gupta, E. Beecherl, N. Onaca, *Baylor University Medical Ctr, Dallas, TX*

Purpose: Total pancreatectomy and intraportal islet autotransplantation (TPIAT) is an effective treatment for patients with refractory chronic pancreatitis. Large volume islet preparations cannot always be infused fully intraportally due to rise in portal vein (PV) pressure and risk of PV thrombosis. We previously showed that dissected preperitoneal pouch (preperitoneal space) can serve as an extrahepatic islet transplant site with long-term graft function in syngeneic mouse model. Here, we evaluated the safety of combined sites of intrahepatic and preperitoneal space in clinical TPIAT and analyzed the outcome.
Methods: Between 2019 and 2020, patients underwent TPIAT using a combined intraportal and preperitoneal pouch technique (IPV+PP) if the infused intraportal islet mass was >4,000 IEQ/kg and PV pressure was > 20mmHg during infusion. Study patients were monitored for complications, and metabolic outcome was assessed and compared with controls who received only intraportally transplanted islets (IPV) or combined intraportal and peritoneal cavity (IPV+PC).
Results: Ten patients underwent IAT into the PV and preperitoneal pouch. Baseline demographics (age, sex, BMI, pretransplant C-peptide and HbA1c, duration of symptoms) and isolation results (PV pressure, IEQ/kg) of each group are shown in Table 1. There were no serious post-operative complications in IPV+PP group during the first post-transplant admission. At 6 months after IAT, there were no significant differences in glycemic control or graft function among three groups. (Table 1)
Conclusions: The preperitoneal space is an alternative supplemental IAT site in patients who do not tolerate a full intraportal islet infusion. It is safe, easily accessible and it tolerates large volume islet preparations. Further studies are needed on a larger cohort of patients to validate our results.

Table 1. Univariate analysis of demographic characteristics of patients, islet isolation, and metabolic outcomes of TPIAT for alternative islet transplant sites

	IPV (N=86)	IPV+PC (N=23)	IPV+PP (N=10)	p-value	p.IPV vs PV+PC	p.IPV vs PV+PP	p.IPV+PC vs PV+PP	N

Abstract# 412

Simultaneous Pancreas-Kidney Transplantation in Caucasian versus African American Patients: Does Recipient Ethnicity Influence Outcomes?

J. Rogers[1], A. Farney[2], G. Orlando[2], C. Jay[2], K. Gurung[2], B. Sharda[2], A. Reeves-Daniel[3], A. Mena-Gutierrez[3], N. Sakhovskaya[3], W. Doares[4], S. Kaczmorski[4], M. Magid[4], M. Gautreaux[2], R. Stratta[2], *[1]Wake Forest Baptist Medical Center, Winston-Salem, NC, [2]Department of Surgery, Wake Forest Baptist Medical Center, Winston-Salem, NC, [3]Internal Medicine, Wake Forest Baptist Medical Center, Winston-Salem, NC, [4]Department of Pharmacy, Wake Forest Baptist Medical Center, Winston-Salem, NC*

Purpose: The influence of African American (AA) recipient ethnicity on outcomes following simultaneous pancreas-kidney transplantation (SPKT) in the modern era is uncertain.

Methods: From 11/01 to 2/19, we retrospectively studied 158 Caucasian (C) and 57 AA patients (pts) undergoing SPKT at our center. All pts received depleting antibody induction (alemtuzumab - 155, rATG - 60) with tacrolimus/mycophenolate ± steroids maintenance immunosuppression. All pts underwent SPKT with intent-to-treat portal-enteric (PE) drainage (192 PE, 23 systemic-enteric drainage).

Results: Mean follow-up was 97 months C vs 88 months AA; 80% of C and 70% of AA pts had at least 5 years f/u. Mean donor age (27 years C vs 23 AA), recipient age (44 years C vs 40 AA), and pancreas cold ischemia (15 hours) were similar between groups. Recipient gender (41% C female vs 44% AA female) was likewise similar. The AA group had fewer pts on peritoneal dialysis (30% C vs 10% AA), more pts with a longer duration (> 20 months) of dialysis (24% C vs 51% AA), more sensitized (PRA ≥ 20%) patients (6% C vs 19% AA), more 5-6 HLA mismatches (49% C vs 67% AA), more pts with pretransplant C-peptide levels ≥ 2.0 ng/ml (13% C vs 33% AA), and more pts with a shorter duration (< 20 years, 23% C vs 47% AA) and later age of onset (≥ 24 years old) of diabetes (13% C vs 30% AA, all p<0.05). The latter 3 differences suggest that a type 2 diabetes phenotype was more prevalent in the AA group. Overall patient survival (74% C vs 88% AA, p=0.04), kidney (63% C vs 67% AA), and pancreas (57% C vs 61% AA) graft survival rates (GSRs) slightly favored the AA group. Death-censored kidney (77% C vs 73% AA) and pancreas (69% C vs 66% AA) GSRs demonstrated that death with a functioning graft (DWFG) was more common in C (18%) vs AA pts (8%, p=0.05). Rates of early graft loss (usually thrombosis) were 7.6% C vs 3.5% AA whereas cumulative clinical acute rejection rates were 27% C vs 33% AA. The incidence of death-censored dual graft loss, usually due to acute and chronic rejection, was 11% C vs 23% AA (p=0.06).

Conclusions: SPKT in AA recipients is characterized by longer pretransplant dialysis duration and less peritoneal dialysis, more sensitized patients and HLA-mismatching, more patients with a type 2 diabetes phenotype, and lower mortality. AA patients are at a greater risk for dual immunological graft loss whereas C patients are at greater risk for DWFG.

Abstract# 99

Trends in Mortality Among Solid Organ Transplant Recipients Hospitalized for Covid-19 During the Course of the Pandemic

M. R. Heldman, O. S. Kates, R. M. Rakita, E. D. Lease, C. E. Fisher, A. P. Limaye, *University of Washington, Seattle, WA*

Purpose: Actual and comorbidity-adjusted mortality in hospitalized patients with COVID-19 has declined in the general population during the course of the pandemic. Whether a similar reduction has occurred in solid organ transplant recipients (SOTR) is unknown.

Methods: We used a multicenter prospective registry of SOTR with laboratory-confirmed COVID-19 to compare 28-day mortality between the early COVID-19 pandemic (3/1/20- 6/19/20) and a late (more recent) period (6/20/20-11/20/20) for those with 28 day follow-up by 11/12/20. A multivariable logistic regression model including previously identified risk factors for mortality (age >65 years, obesity, diabetes mellitus (DM), congestive heart failure (CHF), chronic lung disease, absolute lymphocyte count <0.5 x 10^9/L, and abnormal chest imaging) was used to adjust for covariates.

Results: Of 938 SOTR with COVID-19, 638 (68%) were hospitalized; 165 (26%) hospitalized cases occurred in the late (more recent) period and 472 (74%) cases occurred in the early period . The proportion hospitalized was similar in both periods [late: 165/244 (67.6%) vs. early: 472/692 (68.2%])]. The prevalence of several baseline comorbidities was lower in the late cohort: DM [74/165 (44.8%) vs. 251/472 (54.9%), p=0.01), chronic lung disease [5/165 (3.0%) vs. 47/472 (10.0%)], p=0.01), and CHF [5/165 (3.0%) vs. 37/472 (7.8%), p= 0.03). Presenting features were similar between periods (Figure 1), and treatment with remdesivir, convalescent plasma, and corticosteroids was more frequent in the late period (Figure 2). Crude 28-day mortality was lower in the late period (12.7% vs 20.8%, p=0.02), but mortality did not differ significantly from the early period after adjusting for comorbidities (crude OR 0.56 (95% CI 0.33-0.93) vs. adjusted OR 0.62, (95% CI 0.34-1.10), p=0.11.

Conclusions: There have been shifts in the demographics of SOTR hospitalized for COVID-19 during the course of the pandemic. Although crude mortality was lower in the more recent period, the comorbidity-adjusted mortality has remained constant. Advancements in management strategies shown to reduce mortality in the general population might not be applicable to SOTR.

Abstract# 100

Treg Engagement of Lymphotoxin Beta Receptor in Lymphatic Endothelial Cells is Required for Allograft Protection

V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

Purpose: Sequential migration of regulatory T cells (Treg) from graft to afferent lymphatics and lymph nodes (LN) is needed for Treg suppressive function. Migration requires Treg lymphotoxin alpha (LTα) to stimulate LT beta-receptor (LTβR) in lymphatic endothelial cells (LEC). We used three genetically distinct mouse models to test the hypothesis that Treg engagement of LTβR is required for allograft protection.
Methods: Treg engagement of LTβR was tested in germline deficient $LT\beta R^{-/-}$ and $LT\alpha^{-/-}$ mice. A conditional knockout (KO) of LTβR was made by crossing $LT\beta R^{fl/fl}$ with $Prox1\text{-}Cre\text{-}ER^{T2}$, to generate KO^{fl} mice in which LTβR is depleted in LEC after tamoxifen treatment. Treg function was analyzed by flow cytometry and histology in the islet transplant model.
Results: In vitro, Treg LTα stimulated LTβR and regulated expression and secretion of LEC CCL21, a chemokine important for T cell migration to lymphatic vessels and LN. In KO^{fl} mice, tamoxifen treatment reduced LTβR expression only in LEC, while fibroblastic reticular cells and blood vessel endothelial cells maintained expression. Depletion of LTβR in the LEC of the LN led to a marked reduction in the expression of CCL21, non-canonical NFκB kinase (NIK), chemotactic lipid sphingosine-1-phosphate (S1P) and accumulation of Foxp3+ Tregs in T cell zones. LTβR depletion did not affect overall LN architecture or composition of stromal cells, leukocytes, or innate lymphoid cells in primary or secondary lymphoid organs, suggesting normal immune system homeostasis. In an in vivo model of tissue to draining LN (dLN) lymphatic migration, Tregs migrated less well in the KO^{fl} mice, while Treg entry from blood into LN was not inhibited. In the islet allograft model, when Tregs were transferred locally with the islets, allograft survival was reduced from 25d to 13d in KO^{fl} recipient mice (p<.03), to 15d in germline $LT\beta R^{-/-}$ (p<.03) recipient mice, and to 13d in wild type mice receiving $LT\alpha^{-/-}$ Treg (p<.03). Treg migrated less well from islet allografts to the dLN in the KO^{fl} mice and in mice receiving $LT\alpha^{-/-}$ Treg. Non-migrating Tregs lost Foxp3 and CD25 expression to become exTreg.
Conclusions: Using three different genetic mouse models, Treg-LTα-LTβR-LEC interactions were characterized. Disruption of these interactions inhibits Treg accumulation and migration to LN, execution of Treg suppressive function, and conferred significant disadvantage for islet allograft protection.

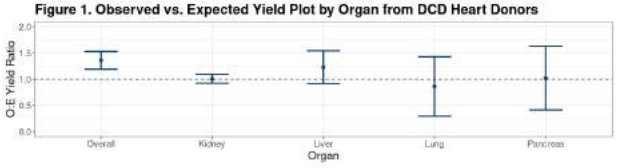
Abstract# 101

DCD Heart Donation: Impact on Organ Yield

K. Gauntt, B. Carrico, D. Klassen, *United Network for Organ Sharing, Richmond, VA*

Purpose: Recent advances in technology and recovery procedures has enabled donation after circulatory death (DCD) heart donation resulting in a significant increase in the number of patients receiving heart transplantation. There has been concern that DCD heart procurement may impair the procurement of other organs, particularly liver. We sought to examine this issue by determining if the overall and organ specific recovery and transplantation or yield of these donors' organs are impacted by these advancements.
Methods: Observed to expected (O:E) yield ratios for each organ were calculated using the OPTN data on DCD heart donors from 12/1/2019 to 8/29/2020 (9 months). Organ yield models as developed by the SRTR were used to calculate the expected organ yield for these donors.
Results: There were 94 DCD heart donors in the cohort and 84 hearts were recovered and transplanted. The procurement of hearts from DCD donors did not appear to have any significant impact on the recovery and transplantation of other organs. The observed yields of liver (O:E: 1.23 (0.91-1.54)), kidney (O:E : 1.01 (0.92-1.09)), lung (O:E: 0.86 (0.39-1.43)), and pancreas (O:E: 1.02 (0.41 - 1.63)) did not significantly differed from their expected yield (Figure 1). However, the O:E yield ratio for each organ was above one with the exception of lung. The overall organ yield of DCD heart donors was observed to be 36% higher than expected (338 vs. 249, p value < .001). The overall yield difference was primarily driven by the significant increase in heart yield.
Conclusions: The advances in DCD recovery procedures and the incorporation of thoracic and abdominal perfusion in recent years have been revolutionary, leading to a significant increase in heart and overall organ yield from these donors. There has been no impairment of the procurement of other organs based on the expected yields for these donors. The impact of these advancements has been substantial, representing a new source of heart donation while maintaining successful recovery and transplantation of other organs.

Figure 1. Observed vs. Expected Yield Plot by Organ from DCD Heart Donors



Organ	Overall	Kidney	Heart	Liver	Lung	Pancreas
Total Actual Yield	338	174	84	58	15	7
Total Expected Mean Yield	248.83	173.05	4.17	47.28	17.43	6.86
Ratio (95% CI)	1.36 (1.19 - 1.53)	1.01 (0.92 - 1.09)	20.13 (20.13 - 20.13)	1.23 (0.91 - 1.54)	0.86 (0.29 - 1.43)	1.02 (0.41 - 1.63)

Abstract# 102

Anti-CD8 Immuno-PET for Non-invasive Tracking of Early Graft Rejection in a Non-human Primate Kidney Transplant Model

K. Bruestle[1], R. Tavare[2], F. Fredriksson[1], E. Duggan[1], F. Huang[1], B. Bhola[1], J. Giurleo[2], R. Foster[2], P. Krueger[2], M. Dobosz[2], D. Ekanayake-Alper[1], H. Sakai[1], B. Piegari[1], J. Castrillion[1], S. M. Coley[1], O. Harari[2], A. Mintz[1], D. Ma[2], A. Griesemer[1], *[1]Columbia University Medical Center, New York City, NY, [2]Regeneron Pharmaceuticals, Inc, New York City, NY*

Purpose: Infiltration of CD8 T cells into solid organ grafts is an early sign of rejection. REGN5054 is a fully human monoclonal antibody that binds specifically to human and cynomolgus T cell CD8. When radiolabeled with ^{89}Zr, REGN5054 immuno-PET is a non-invasive method that may detect early graft rejection.
Methods: REGN5054 was conjugated to the bifunctional chelator p-SCN-Bn-deferoxamine (DFO) for ^{89}Zr radiolabeling to generate ^{89}Zr-DFO-REGN5054. 4 cynomolgus macaques underwent induction with splenectomy, rituximab, mycophenolate-mofetil, tacrolimus, steroids, and orthotopic kidney transplantation. The contralateral, naïve kidney served as control. An initial phase of immunosuppression (IS) was followed by a phase of simulated graft rejection by tapering down IS, and a phase of rescue by tapering up IS. At the end of each phase, antibody was injected and immuno-PET/CT images followed Day1 and Day4. Graft kidney biopsies and ultrasound were performed and plasma samples collected for immunogenicity and PK analysis.
Results: ^{89}Zr-DFO-REGN5054 showed low uptake in both graft and native kidneys during pre-rejection. Increased uptake was detected in the graft during rejection by immuno-PET (Figure 1), correlating with histologic lymphocyte infiltration and increased resistance indices in ultrasound (Figure 2). Post-rejection, uptake in the kidney grafts was incompletely reduced compared to the rejection phase, while the uptake in the native kidney remained similar.
Conclusions: Anti-CD8 Immuno-PET is a sensitive, non-invasive tool to track early graft rejection.

Abstract# 103

Changes to Adult Heart Allocation Improve Candidate Stratification

K. Bradbrook[1], K. Lindblad[1], R. R. Goff[1], R. Daly[2], S. Hall[3], *[1]Research, United Network for Organ Sharing, Richmond, VA, [2]Mayo Clinic, Rochester, MN, [3]Baylor University Medical Center, Dallas, TX*

Purpose: Historically, heart allocation has been driven by waitlist (WL) mortality rather than post-transplant survival. On 10/18/2018 the Organ Procurement and Transplantation Network (OPTN) implemented modifications to the adult heart allocation system intended to better stratify the most medically urgent candidates by WL mortality.
Methods: The impact of changes to the adult heart allocation system were assessed by comparing cohorts of WL additions and candidates transplanted pre (04/18/17-10/17/18) and post (10/18/18-04/17/20) implementation. WL mortality, median time to transplant, transplant rates and six-month survival were compared between medical urgency statuses, status criteria and era. Fine-Grey competing risks and unadjusted Kaplan Meier methods were used to estimate median days to transplant and 6-month patient survival, respectively.
Results: WL mortality was significantly higher for Status 1 vs. Status 2 and for Status 2 vs. Status 3 candidates. Criteria within medical urgency statuses had similar WL mortality rates. Median days to transplant decreased pre- to post-implementation (M_{pre}= 224, M_{post}= 105) with higher statuses having shorter wait times (Status 1 M_{post}= 5, Status 2 M_{post}= 10, Status 3 M_{post}= 28 days). Median time to transplant varied across criteria within statuses, with a maximum within-status difference of 226 days. Transplant rates were significantly higher for the most medically urgent candidates compared to each subsequent status (Status 1: 2987 [2685, 3313]; Status 2 1891 [1810, 1976]; Status 3: 305 [286, 326]; Transplants per 100 patient years). Six-month patient survival did not differ between eras (pre=93.6%, post=92.7%; p=0.24).
Conclusions: Overall, the implementation of the new adult heart allocation policy resulted in better stratification of the most medically urgent heart candidates according to risk of death on the WL with decreased median wait times, higher transplant rates and no observed adverse effect on 6-month patient survival.

Abstract# 104

Incorporation of Donor Liver Macrovesicular Steatosis Into Srtr Risk Adjustment Models for Deceased Donor Yield and Post-Transplant Outcome

A. Kwong[1], C. Wang[2], A. Wey[3], N. Salkowski[3], J. Snyder[4], J. Wetmore[2], A. Israni[2], J. Lake[4], P. Stock[5], W. Kim[1], *[1]Stanford University, Redwood City, CA, [2]Medicine, Hennepin Healthcare, Minneapolis, MN, [3]Scientific Registry of Transplant Recipients, Minneapolis, MN, [4]University of Minnesota, Minneapolis, MN, [5]University of California, San Francisco, San Francisco, CA*

Purpose: The SRTR had not traditionally included biopsy results in post-transplant risk adjustment, yet biopsy results may influence outcomes and thus decisions regarding organ acceptance. The aim of this study was to evaluate the impact of donor macrovesicular steatosis on organ yield and graft outcome after liver transplantation, and the effect of incorporating this variable into SRTR risk adjustment models for organ yield and program-specific graft outcomes.

Methods: This study used data from the Scientific Registry of Transplant Recipients, which includes all donors, waitlisted candidates, and transplant recipients in the United States. We examined the association between macrovesicular steatosis and deceased donor yield, and the relationship between macrovesicular steatosis and 1-year posttransplant graft outcome using multivariable logistic regression and Cox models with the least absolute shrinkage and selection operator (LASSO).

Results: 3.3% of donors had 31-50% macrovesicular steatosis on liver biopsy, and 1.3% with >50%. Increasing levels of steatosis on donor liver biopsy predicted lower organ yield; 31-50% and >50% macrovesicular steatosis was associated with 88 and 96% lower odds of utilization, respectively (Figure A). The risk of posttransplant graft failure with donor livers with >30% macrovesicular steatosis was 30% higher (HR 1.30), compared to those with no pre-transplant liver biopsy or those with 0-10% macrovesicular steatosis (Figure B). There was minimal change on organ procurement organization (OPO)-specific deceased donor yield or program-specific post-transplant outcome assessments when macrovesicular steatosis was added to the existing SRTR risk adjustment models.

Conclusions: Macrovesicular steatosis is associated with lower organ yield and reduced graft survival. This risk factor has been added to the SRTR risk adjustment models for OPO and program-specific assessments and may facilitate more judicious use of these higher-risk organs.

Figure. (A) Average livers transplanted per donor, and (B) 1-year post-transplant graft and patient survival by degree of macrovesicular steatosis.

Abstract# 105

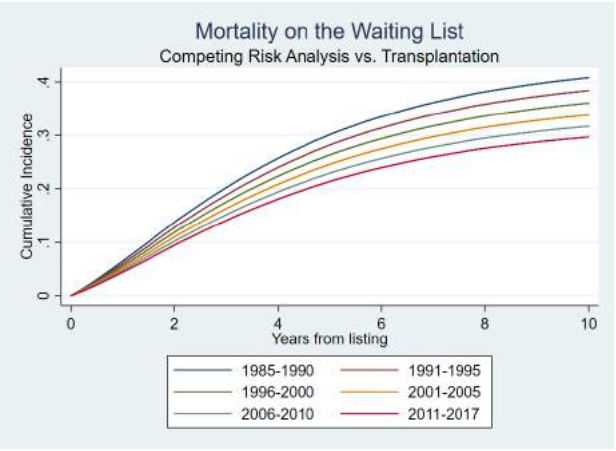
Increasing Survival on the Kidney Transplant Waiting List: A Thirty-Three Year Analysis

E. L. Godfrey[1], P. T. Kambhampati[1], J. A. Goss[2], A. Rana[2], *[1]Baylor College of Medicine, Houston, TX, [2]Division of Abdominal Transplantation, Department of Surgery, Baylor College of Medicine, Houston, TX*

Purpose: The shortage of available donor kidneys remains the greatest obstacle to transplantation, with many patients spending years on the transplant list. During this time, dialysis and comorbidity management are the standard of care. Given numerous improvements in dialysis and medical management, we sought to evaluate survival on the kidney waiting list across the modern era of transplantation. We hypothesized that survival on the waiting list has increased over time, despite increased presence of comorbid risk factors over the last three decades.

Methods: A retrospective cohort study was conducted of all adults (at least 18 years of age) listed for kidney transplant along between 1984 and 2017 in the OPTN STAR files. Single and multivariable competing risk, Kaplan-Meier survival, and Cox regression analyses were performed to assess the relationship between listing era, patient characteristics and risk factors, and the primary outcome of death prior to transplantation - measured as waiting list death or disease progression resulting in delisting.

Results: A total of 734,665 listed candidates were identified. Candidate BMI at listing increased from 24.6 in 1984-1990 to 28.1 in 2011-2017, and age from 41.2 years to 51.6. Frequency of comorbid diabetes increased from 14.6% to 42.3%, and more patients are on dialysis at the time of listing - 75.1% in the 2011-2017 era, compared to 66.1% in the 1996-2000 era. Fewer individuals are receiving transplants (57.1% in 2006-10 vs 66.5% in 1984-90) and time spent on the waiting list has increased to1039 days in 2006-10 from 660 days in 1984-90. Despite these changes, survival on the waiting list over time has increased in each successive era in single and multivariable Cox and competing risk analysis (HR = 0.857 for era, 95% CI 0.831 - 0.883). This is the case across all risk sub-groups and diagnoses, with the exception of the small number of individuals listed in poor functional status.



Conclusions: This analysis demonstrates an increase in survival on the kidney waiting list over the past three and a half decades, despite an increase in risk factors for mortality among the candidates listed in the same period.

Demographics and Clinical Characteristics of Patients listed for Kidney Transplantation by Era						
Era	1984-1990	1991-1995	1996-2000	2001-2005	2006-2010	2011-2017
Candidate age	41.3 ± 12.8	44.0± 13.0	47.0± 13.2	49.0± 13.5	50.9± 13.5	51.6± 13.7
Body Mass Index (BMI)	24.9 ±5.8	25.5 ±5.5	26.5 ± 5.6	27.4 ± 5.7	28.3 ± 5.7	28.8 ± 5.6

Abstract# 106

The Evolution of the National Liver Review Board

S. Noreen[1], J. Trotter[2], J. Pomposelli[3], M. Cafarella[1], J. Heimbach[4], *[1]UNOS, Richmond, VA, [2]BSWHealth, Dallas, TX, [3]UCHealth, Aurora, CO, [4]Mayo Clinic, Rochester, MN*

Purpose: The National Liver Review Board (NLRB) was implemented 5/14/2019, establishing a national structure for liver exceptions comprised of three specialty review boards and a scoring system based on the median score for the area of distribution. The area of distribution was revised with the implementation of Acuity Circles (AC) on 2/4/2020. The OPTN Liver Committee has been closely evaluating this policy.

Methods: OPTN exception requests and liver waitlist (WL) registrations data during 8/21/2018-5/13/2019 (RRB era), 5/14/2019-2/03/2020 (pre-AC NLRB era), and 2/04-10/26/2020 (post-AC NLRB era) were used, as well as snapshots of the WL

each month from 8/2019 - 10/2020. OPTN transplant data was used for deceased donor liver-alone transplants, divided into RRB (8/21/2018-3/18/2019), pre-AC NLRB (5/14-12/09/2019), and post-AC NLRB (2/04-8/31/2020) eras. Chi-square and Kruskal-Wallis tests assessed differences between eras.

Results: The proportion of auto-approvals significantly increased over the study period (38% post-AC NLRB, 31% pre-AC NLRB, 24% RRB eras, p<0.001). Time for reviewers to resolve cases in the post-AC NLRB era continued to decrease over time (average 4.4 days post-AC NLRB, 5.1 pre-AC NLRB, 5.8 RRB eras, p<0.001). WL dropout rates increased for exception candidates, with similar rates for non-HCC exceptions and non-exceptions post-AC NLRB era, and the relationship between non-exception and HCC exception transplant rates has reversed (Figure 1). There was a decrease in the proportion of exceptions on the WL and transplants (Figure 2).

Conclusions: More exception forms continue to be automatically approved, decreasing the burden on reviewers. Reviewers also continue to resolve cases quicker. Exception candidate priority relative to non-exception candidates has begun to decrease, particularly for HCC exception candidates, and this has allowed non-exception candidates with higher medical urgency to receive transplants while driving down the scores at which exception candidates access transplant.

Figure 1. Liver waitlist dropout rates (Panel A) and transplant rates (Panel B), by exception status and policy era

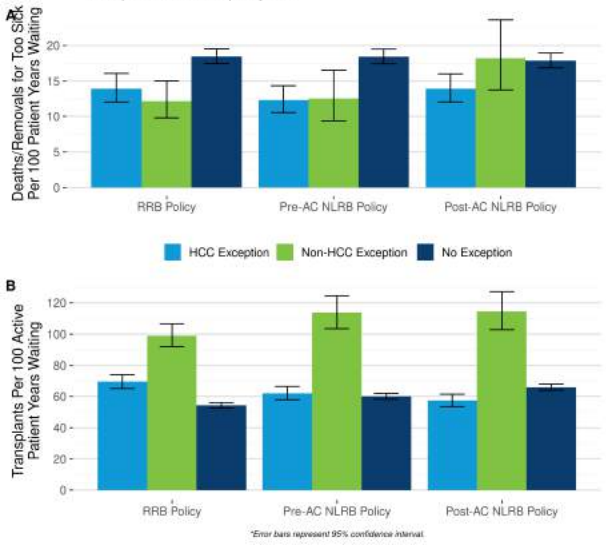

Figure 2. Percentage of the liver waiting list (Panel C) and deceased donor liver-alone transplant recipients (Panel D) with an exception by age and month

Abstract# 107

Profound Opportunities Lost: Patients with High Priority for Ideal Donor Kidneys That are Not Placed on the Kidney Transplant Waiting List

J. Schold[1], A. Huml[1], E. Poggio[1], J. Sedor[1], S. Husain[2], K. L. King[2], S. Mohan[2], *[1]Cleveland Clinic Foundation, Cleveland, OH, [2]Columbia University, New York, NY*

Purpose: The national Kidney Allocation System(KAS) prioritizes patients with high (top 20%) Estimated Post-Transplant Survival (EPTS) with expedited access to high quality deceased donor kidneys. The primary aim of this study was to evaluate the proportion and characteristics of ESKD patients that would qualify with top 20% EPTS scores but are not placed on the kidney transplant waiting list.

Methods: The study included adult (18+ years) ESKD patients in the United States Renal Data System on the waiting list or dialysis who qualify for top 20% EPTS from 12/4/2014-12/31/2016. We compared characteristics and outcomes of patients that were and were not placed on the transplant waiting list.

Results: There were 36,934 patients with top 20% EPTS score with mean age=32.0 years(std=8.0), 55% male, 38.9% non-Hispanic Caucasian, 32.0% African American and 19.9% Hispanic. Of these, 14,954(40.5%) were on the waiting list and independent factors associated with reduced likelihood of waitlist placement included diabetes(Adjusted Odds Ratio[AOR]=0.24,95%CI 0.22-0.26), African American race(AOR=0.89,95%CI 0.80-0.84), lowest residential income quintile(AOR=0.52,95%C.I.0.46-0.58), non-commercial insurance, end-stage renal networks and comorbidities. Results persisted excluding patients with any documente marginal contraindications including morbid obesity. Two-year survival for patients not on the waiting list was 95%.

Conclusions: There are substantial numbers of ESKD patients that would qualify for top 20% EPTS status not on the waiting list when they would receive prioritization to ideal donors. Non-listing for patients that are likely ideal transplant candidates were markedly reduced for African Americans, non-privately insured and patients in lower income communities. These lost opportunities may have profound impact on patients' long-term prognoses. Efforts to expedite care for qualifying candidates are needed and polices automating transplant referral for these patients should be considered.

Impact of Donor Kidney Biopsy on Kidney Yield and Post-Transplant Outcomes

C. Wang[1], J. Wetmore[1], A. Wey[2], N. Salkowski[2], J. Snyder[2], A. Israni[1], *[1]Nephrology, Hennepin County Medical Center, Minneapolis, MN, [2]Scientific Registry of Transplant Recipients, Minneapolis, MN*

Purpose: Kidney procurement biopsy findings, such as Glomerulosclerosis (GS) is frequently used to determine kidney quality, but it remains unclear the degree of GS in increasing the risk of kidney discard and graft and patient loss. We sought to investigate the impact of GS% on organ yield of organ procurement organizations (OPOs) and patient outcomes of transplant programs by including GS% in yield models and program-specific report (PSR) models.

Methods: Demographic, clinical and histological information of deceased donors from July 1, 2017 through June 30, 2019 were included in the analysis. Multivariable logistic regression and Cox models with Least absolute shrinkage and selection operator (LASSO) were used in logistic and Cox models to analyze the association of GS with organ yield and 1-year post transplant outcomes, respectively.

Results: Both maximal GS% and minimal GS% must be known to determine the overall relationship between GS and yield, so maximal GS% was plotted against kidney yield, stratified by level of minimal GS%. Shown in Figure 1, increasing level of maximal GS or minimal GS was associated with lower yield. For example, kidney yield was 1.6 when both maximal and minimal GS were <5%, but only 0.88 when both maximal and minimal GS were >20%. Only minimal GS is needed to determine transplant outcomes. Shown in Figure 2, minimal GS 16-20% was associated with increased risk graft failure (HR 1.05 with GS 16-20% and HR 1.3 with GS>20%) and minimal GS >20% was associated with increased risk mortality (HR 1.2).

Conclusions: Increased GS was associated with lower organ yield and inferior patient and graft survival after kidney transplantation. Incorporation of GS into the yield and PSR models that occurred since January 2020, likely will reassure OPOs and transplant centers pursuing kidneys with relatively high levels of GS and this approach may promote use of organs with higher levels of GS and reduce discard rates.

Abstract# 109

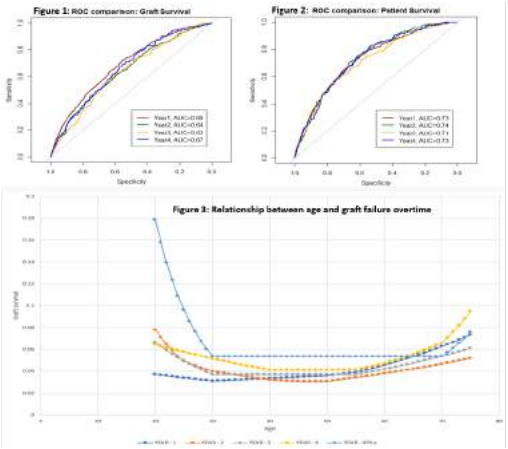
Predicting Post-transplant Death and Graft Loss Risk: Insight at Listing

N. Dzebisashvili[1], M. Schnitzler[2], K. Lentine[2], K. Venkataramani[1], S. Ghosh[1], *[1]CareDx, Brisbane, CA, [2]Saint Louis University, St. Louis, MO*

Purpose: Prognostication models for post-transplant outcomes deriving inputs from information collected on donor (DDR/LDR), candidate (TCR) and transplant recipient (TRR) registrations can provide useful information to guide risk assessment and management. Our novel machine learning approach assesses patients at listing and different points during pre-transplant phase to predict post-transplant graft and patient survival.

Methods: Organ Procurement and Transplant (OPTN) registry data for 97,963 adult kidney-only transplant recipients (2009-2019) was used to estimate 1-, 2-, 3-, and 4-year post-transplant graft (GS) and patient survival (PS). Pediatric and multi-organ transplants were excluded. Follow-up was censored at the end of study (09/08/2019). Cox models were built using LASSO regularization and shrinkage with 10-fold cross-validation. Features included listing data, co-morbidities and functional status. Waiting time was accounted for utilizing earliest of dialysis or listing dates for the listing record. To account for effect-size of covariates across time, GS and PS estimates were derived for each post-transplant year independently. For improved accuracy, variance inflation factor was used to detect multicollinearity and assign predictor weights appropriately.

Results: AUCs for 1-, 2-, 3-, and 4-year post-transplant GS were 0.68, 0.64, 0.63 and 0.67 (Figure 1), respectively. AUCs for 1-, 2-, 3-, and 4-year post-transplant PS were 0.73, 0.74, 0.71 and 0.73, respectively (Figure 2). We observed a change in relationship between age and graft survival over time (Figure 3). Risk of graft failure increased linearly with age during year 1 but was more pronounced for younger and older patients over in later years. Finally, outcomes for each post-transplant year were estimated for representative donor groups (living donor and KDPI categories) for the purpose of providing augmented intelligence for clinical practices.



Conclusions: Assessment of post-transplant outcomes using patient information collected at the time of listing demonstrated utility to assess post-transplant risk for patients on the waiting list. Machine learning models could be translated into decision support tools to standardize and optimize waitlist management.

Abstract# 110

Framing the Conceptualization of Uterus Transplantation: A Mixed Methods Study

A. Wall[1], L. Johannesson[1], M. Sok[2], A. Warren[3], E. Gordon[4], G. Testa[1], *[1]Abdominal Transplant Surgery, Baylor University Medical Center, Dallas, TX, [2]Obstetrics and Gynecology, Baylor University Medical Center, Dallas, TX, [3]Trauma and Critical Care, Baylor University Medical Center, Dallas, TX, [4]Northwestern University, Dallas, TX*

Purpose: Absolute uterine factor infertility (AUFI) affects 1-5% of women of childbearing age, and was recently the only untreatable cause of infertility. Clinical trials have demonstrated the feasibility and reproducibility of uterus transplantation (UTx) to treat UFI. Because UTx aims to enhance the quality of life among women with UFI by enabling them to experience pregnancy and child-birth, clinical feasibility is not enough to ethically justify this procedure. The experiences of women who undergo UTx must truly be life-enhancing to justify the risks of surgery and immunosuppression. This study aimed to assess the perceptions of UTx recipients regarding their experiences with infertility and UTx, and their responses to societal perceptions of UTx.

Methods: Semi-structured interviews of UTx recipients from a single center. Interviews were conducted by phone or in-person, audio recorded, transcribed, and coded independently by two analysts. Qualitative data were analyzed for themes. Quantitative demographic and transformed qualitative data were analyzed using descriptive statistics.

Results: Twenty of twenty UTx recipients consented to participate and completed interviews. Thematic saturation occurred at 12 interviews. Major themes and representative quotations are shown in the figure.

Theme	Representative quotations
Life experience with uterine factor infertility	➢ It feels like your womanhood was taken away from you. ➢ It meant every vision that I had had for my future was immediately erased from my mind and taken away from me because I had always grown up thinking like I wanted to have a big family and I couldn't wait to be pregnant and all this stuff and it was gone. ➢ When you're told at a young age that it's just not an option for you to have your own child- how that cuts into you, you can't describe that. It feels like part of you is just ripped out and completely taken away.
Experience with uterus transplant	➢ I felt like this would have been the best thing for me not only to be able to have my own biological child but to be able to experience pregnancy. And that's one of the main things that I wanted to do, too. You know I wanted to be able to look down and see my belly growing and feel my baby kick and have a baby shower and see how it felt to be pregnant. ➢ And there is now that sateen or seventeen year old finding out… that it's [UFI] getting diagnosed and now has hope for the future. Now she has options. So, was worth it? Yes. ➢ I actually had a doctor that participated in my C-section that actually came into my postpartum room and told me, "I was against these transplants until I was in the room with you. And it gets me emotional and I realized how much, why you did this." And, so, you know to hear that from a medical professional about someone who was completely against these transplants because he thought it was a waste of money and a waste of time. And then to hear my story and see my baby girl be born like people just can't put a number on that financially, and they can't say it's not worth it.
Conceptualization of the uterus transplant enterprise	➢ And that anyone that tries to make someone feel bad about a decision that they have made to start their family… it's ignorant. They don't understand everything involved in infertility and all of the emotional things that are involved, or that go into making a decision. It's such a big decision. ➢ While I do think adoption is beautiful, if your heart's not in it, your hearts not in it. You can't force it. The same goes for a surrogate or for a uterus transplant. If you don't want to do it, don't do it. ➢ Well when you're born, you know you expect to have all the pieces. If you have something, I don't want to say wrong. But if you have something wrong on the outside people fix it, and they're more than happy to fix it. If you have a club foot, a cleft lip, people are ready and willing to help you. ➢ It's not a life-saving transplant. I understand that but it's a life giving and I think it's very important to be able to give everybody that chance to give a life.
Living versus deceased donor approaches	➢ You could say from an ethical standpoint the deceased donor is better but there's just there's just there's not enough. You would never you would never have enough. ➢ A living donor was my ideal to me because it felt like good energy, because that person wanted to help. ➢ I honestly don't know that I would have any preference as long as the success rate for all of them was the same.

Conclusions: All interviewees were negatively affected by their diagnosis of AUFI and found value in uterus transplantation, even recipients with early graft failures or miscarriages. Our study reports the first insights into the personal experiences of UTx recipients, demonstrating both personal perceptions of the value of uterus transplantation and the profound effect of UFI on women who seek this option.

Abstract# 111

Development and Validation of a Novel Peripheral Blood Based Gene Signature for Acute Rejection Following Renal Transplantation

D. Zhang, Y. Wang, X. Hu, *Department of Urology, Beijing Chao-Yang Hospital, Capital Medical University, Beijing, China*

Purpose: The aim of this study is to utilize advanced machine learning methods to construct a peripheral blood-based gene signature for acute rejection following kidney transplantation.

Methods: After systematically screened the databases, two independent cohorts of high quality with blood expression profiles and biopsy-proven graft status from the Gene Expression Omnibus database were employed as training and validation cohorts. Then, two machine learning algorithms (support vector machine recursive feature elimination and random forest) were used to identify key biomarkers for acute rejection. Subsequently, the least absolute shrinkage and selector operation logistic regression method was applied to construct a gene signature for acute rejection in the training cohort. Patients were divided into high-risk and low-risk groups based on the cutoff point identified by the ROC curve. The signature was validated in an independent validation cohort with fixed formula and same cutoff point. ssGSEA was used to estimate immune cells in the blood.

Results: Combining two advanced machine learning algorithms, seven key biomarkers were filtered out. Then, using the least absolute shrinkage and selector operation logistic regression method, a novel three-gene signature was constructed. The signature had high accuracy in both training (AUC=0.968) and validation cohort (AUC=0.925). Notably, the signature had high specificity in diagnosing acute rejection (0.958 in training cohort and 0.964 in validation cohort). Additionally, these three genes were found to have significant and consistent relationships with blood immune cells in both cohorts.

Conclusions: We developed a novel blood-based three-gene signature to non-invasively diagnose renal acute rejection, which offered an accurate and convenient tool for clinical practice. Besides, the current study addressed the promising prospect of blood gene biomarkers in the field of kidney transplantation.

Abstract# 112

Multiplexed Imaging Mass Cytometry of the Alloimmune Landscape of Rejection in Clinical Liver Transplantation

J. Emamaullee, N. Ung, C. Man, J. Hoeflich, C. Goldbeck, A. Barbetta, R. Sun, N. Matasci, J. Katz, J. Lee, S. Chopra, L. Sher, S. Asgharzadeh, O. Akbari, Y. Genyk, *University of Southern California, Los Angeles, CA*

Purpose: Rejection continues to be an important cause of graft loss and failure post-liver transplant (LT). Imaging Mass Cytometry (IMC) is an emerging preclinical technique that allows for highly multiplexed simultaneous analysis of immune phenotypes within fixed tissue specimens. In this study, we developed a liver-specific IMC panel as well as an informatics-based analysis pipeline to deeply analyze the immune landscape of chronic rejection (CR) post-LT.

Methods: A retrospective review of our center identified cases of re-transplant for CR. Regions of interest were identified by our clinical pathologist. A panel of heavy metal-tagged antibodies (Collagen, CD45RA, CD45, CD20, CD3, CD8, CD66a, CD68, CD235, HLA-DR) and a nuclear tag (Iridium) were used simultaneously to label fixed tissue sections for spatial characterization using Hyperion CyTOF IMC. A post-IMC Analysis Pipeline was developed for segmentation and spatial molecular mapping via quantification and co-localization of labeled markers. A total of 18 CR and 5 normal liver (NL) cases were examined.

Results: Examples of IMC staining versus traditional immunohistochemistry (IHC) are shown in Fig. 1A. Detailed quantification of 109,245 cells was completed, of which 30,646 were some type of immune cells after identification. Single cell segmentation followed by Phenograph clustering was used to identify immune subpopulations (Fig. 1B). These clusters were then applied back to the tissue sections to understand density and spatial relationships for each immune population (1C) and quantified (1D), showing significant differences in the proportion of each population between CR and NL ($p<0.0001$ for each cluster). The entire population of patients was examined using tSNE dimensionality reduction techniques across the IMC marker panel. Modeling via principal component analysis revealed highly consistent immune phenotypes across patients with CR when compared to NL, despite the inherent heterogeneity of clinical LT patients (1E, $p=0.000036$).

Conclusions: This study highlights the power of IMC to provide high-resolution, multiplexed analysis of the intragraft immune microenvironment during clinical rejection episodes. Hepatic macrophages have not typically been considered to be involved in CR post-LT, and these data suggest that they may represent a new therapeutic target to treat CR. Further development of IMC has the potential to generate predictive models of clinical outcomes using tissue-specific immune mapping.

Abstract# 113

Hypothermic Oxygenated Machine Perfusion Protects Against Cholangiocyte and Hepatocyte Injury and Mitigates Inflammation vs Static Cold Storage: Preliminary Results from a Single Center

G. Panayotova, F. Paterno, M. McCarty, G. Dikdan, S. Simonishvili, Y. Qin, L. Brown, A. Amin, K. E. Lunsford, J. V. Guarrera, *Transplant Surgery, Rutgers NJMS, Newark, NJ*

Purpose: Hypothermic-oxygenated machine perfusion ($HMP-O_2$) is a promising preservation technique with potential to mitigate ischemia/reperfusion injury and improve graft and patient outcomes. Here we present preliminary results from a single center within the PILOT trial (NCT03484455), a prospective, multi-center randomized controlled trial comparing $HMP-O_2$ to Static Cold Storage (SCS), using the LifePort Liver Transporter (Organ Recover Systems, Itasca, IL).

Methods: 13 SCS and 7 $HMP-O_2$ cases were analyzed over a median of 10mo. Preservation fluid samples were serially collected during $HMP-O_2$ and after flush for SCS to normalize for volume of distribution. Liver and bile duct biopsies and bile fluid were collected 1hr post reperfusion. Bile analysis was performed via the iSTAT-1/$CG8^+$ system. Preservation and bile fluid cytokine/chemokine levels were measured by Luminex (Millipore). Preservation fluid FMN, a known predictive biomarker for poor outcomes post-transplant, was measured via fluorescence absorbance. A $p<0.05$ was considered significant.

Results: Donor and recipient characteristics were similar between groups. Cold time was longer for $HMP-O_2$ vs SCS (6.9 vs 5.4hrs, $p<0.01$). RBC utilization was greater following SCS vs $HMP-O_2$ (14 vs 7 units, $p=0.05$). Overall patient and graft survival was 100% for both. Patients experienced more immediate complications and more long-term post-operative adverse events after SCS vs $HMP-O_2$ (Comprehensive Complication Index, CCI, 56 vs 42, $p<0.05$), **Figure 1**. Post-reperfusion cholangiocyte injury was mitigated by perfusion, as reflected by higher bile glucose in SCS cases (156 vs 55 mg/dL, $p<0.05$). Biliary and acute liver injury-associated chemokine MIP-1β (2 vs 10 pg/mL, $p<0.05$) and perfusate FMN (0.03 vs 0.2 μg/mL, $p<0.001$) were significantly lower in preservation fluid following $HMP-O_2$ vs SCS, **Figure 1**. These markers correlate with improved post-operative graft function and decreased acute liver injury following transplant.

Conclusions: $HMP-O_2$ appears to be a safe and effective preservation method. Preliminary results demonstrate improved short-term outcomes, improved inflammatory profile, and better early graft function. Biomarkers in perfusate may provide targets for future intervention in efforts to mitigate IRI, expand the liver donor organ pool, and improve long-term patient outcomes. Further study is needed to fully characterize the benefits of $HMP-O_2$ in liver transplantation.

Abstract# 114

The Effect of the Affordable Care Act on Insurance Status, Waitlist, and Transplant Outcomes in Liver Transplantation

B. I. Shaw[1], M. L. Samoylova[1], V. Wang[2], T. Risoli Jr[3], S. Peskoe[3], K. Caddell[3], L. M. McElroy[1], *[1]Surgery, Duke University, Durham, NC, [2]Population Health Sciences, Duke University, Durham, NC, [3]Biostatistics, Duke University, Durham, NC*

Purpose: The Affordable Care Act (ACA) intended to expand Medicaid to cover all adults with income below 138% of federal poverty level. We describe the effect of the ACA on payor status and outcomes of liver transplant candidates.

Methods: We conducted a retrospective cohort study of liver transplant candidates and assessed changes in payor sources and outcomes in the years before (2007-2010), during (2011-2014), and after (2015-2018) ACA implementation. For waitlist outcomes (death/delisting and transplant), multivariable competing risks models were used to estimate sub-distribution hazard ratios (SHR), with interaction terms used to assess the changing impact of insurance over time. Poisson models were used to estimate incidence rate ratios (IRR) for inactivations within the first year. For transplant outcomes, Cox proportional hazards models were used to estimate the effect of insurance status on death and graft loss over time.

Results: In our cohort of 121,298 liver waitlisted candidates, the proportion insured by Medicaid increased over time (Table 1). Medicaid patients had higher risk of death or de-listing (SHR 1.31 95%CI 1.26-1.35, p<0.001) and lower risk of receiving transplant (SHR 0.81 95%CI 0.79-0.83, p<0.001) than those privately-insured. After 2014, the likelihood of transplant for Medicaid candidates further decreased (Figure 1). Medicaid-insured patients had a higher rate of inactivation within the first year on the waiting list than the privately insured (IRR 1.20 95%CI 1.19-1.20,p<0.001). Among those receiving liver transplant, Medicaid-insured patients had higher risk of death (HR 1.16 95% CI 1.11-1.21,p<0.001) and graft loss (HR 1.20 95%CI 1.14-1.25, p<0.001); these risks did not significantly change over time.

Conclusions: Medicaid expansion via the ACA is associated with an increase in the number of patients listed for liver transplant, but these patients continue to have inferior waitlist and post-transplant outcomes relative to the privately insured.

Table 1. Proportion of waitlist on Medicaid, by listing state ACA expansion timing and waitlist era

Characteristic	**2007-2010.** (n=38,575)	**2011-2014.** (n=39,656)	**2015-2018.** (n=43,067)	p-value
Initial Expansion	n=20,364	n=20,803	n=22,234	
Medicaid	3,625 (17.8%)	4,059 (19.5%)	5,225 (23.5%)	<0.001
Later Expansion	n=5,024	n=4,774	n=5,025	
Medicaid	739 (14.5%)	758 (15.9%)	885 (17.6%)	<0.001
No Expansion	n=12,996	n=13,843	n=15,639	
Medicaid	1,559 (12.0%)	1,751 (12.6%)	1,598 (10.2%)	<0.001

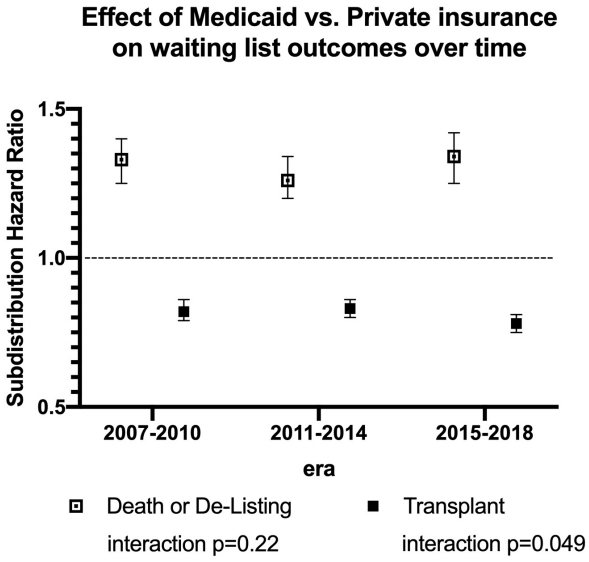

Figure 1. Effect of Medicaid vs Private insurance on liver transplant waitlist outcomes, by era.

Abstract# 115

Gain of Function Mutations in Latent Membrane Protein 1 of Epstein Barr Virus are Associated with Increased Risk of Post-Transplant Lymphoproliferative Disorder

O. M. Martinez[1], S. M. Krams[1], M. Robien[2], M. Lapasaran[1], M. Arvedson[1], K. Weinberg[1], S. Boyd[1], B. Armstrong[3], C. Twist[4], D. Gratzinger[1], B. Tan[1], A. Trickey[1], M. Sever[3], M. Brown[2], D. Bernstein[1], C. O. Esquivel[1], *[1]Stanford University Sch of Med, Stanford, CA, [2]NIAID, Rockville, MD, [3]Rho, Durham, NC, [4]Roswell Park, Buffalo, NY*

Purpose: Post-transplant lymphoproliferative disorder (PTLD) remains a serious problem in the pediatric transplant population. Clinical Trials of Organ Transplantation in Children (CTOTC)-06 is a prospective NIAID-sponsored multi-institutional study intended to identify viral and immune biomarkers of Epstein-Barr virus (EBV)-associated PTLD. Here we report analysis of the complete CTOTC-06 data set.

Methods: 944 pediatric subjects were enrolled at 7 centers in the US from 2014-18, of whom 872 received a transplant: liver (n=421), kidney (n=219), heart (n=180), or intestine (n=52). Immunosuppression and anti-viral therapy were per each center's standard protocol. Mean age at transplant was 6.7±6.3 years (range <1-21 years) with 54% males and 46% females. Over 4700 blood samples were prospectively collected at enrollment or transplant, every 3 months during the first 2 years, twice yearly thereafter, and at PTLD diagnosis. DNA was isolated from whole blood and the cytoplasmic region of the EBV oncogene LMP1 was PCR amplified, cloned and sequenced to determine the presence of G212S and S366T gain of function mutations.

Results: 34 subjects (3.9%) reached the primary endpoint of biopsy-proven EBV+ PTLD. Incidence varied by organ type: small intestine 13.5%, heart 4.4%, kidney 3.2%, and liver 2.9%. The mean time post-transplant to diagnosis of EBV+ PTLD was 564.9±525.3 days (range 51-2303) and the mean time from EBV positivity to PTLD was 384.1±526.6 days (range 0-2310). PTLD WHO subtypes were early lesion (38.2%), monomorphic (44.1%) and polymorphic (17.7%). EBV serostatus of donors (D) and recipients (R) for those who developed PTLD vs all transplanted subjects was D+R+ (26.5% vs 43%), D+R- (41.2% vs 23.7%), D-R+ (8.8% vs 11.2%), D-R- (8.8% vs 8.3%) and unknown (14.7% vs 13.8%). DNA was available for LMP1 sequencing from 32 PTLD cases and 62 matched controls. Both mutations (G212S and S366T) were present in 31 of 32 PTLD cases (96.9%) and in 45 of 62 matched controls (72.6%) (p=0.005, OR=11.7, 95% CI 1.5, 92.6). For EBV+ PTLD, the presence of both mutations had a positive predictive value of 5.1% and a negative predictive value of 99.5% with a very high sensitivity of 96.9% and a modest specificity of 27.4%.

Conclusions: In this prospective, multicenter clinical trial we demonstrate a significant association between the presence of both LMP1 mutations G212S and S336T and the development of EBV+ PTLD. Pediatric transplant recipients who lacked both mutations in LMP1 had a very high probability of not developing PTLD. Thus, determination of LMP1 mutation status post-transplant could be informative in stratifying patients for risk for PTLD development.

Abstract# 116

Clinical and Molecular Profiling Can Help in Predicting the Response to Alemtuzumab Treatment in Kidney Transplant Recipients with Severe or Glucocorticoid-Resistant Acute Rejection

D. M. Peelen[1], M. van der Zwan[1], M. C. Clahsen-van Groningen[2], D. A. Mustafa[2], C. C. Baan[1], D. A. Hesselink[1], *[1]Internal Medicine - Nephrology & Transplantation, Erasmus MC, Rotterdam, Netherlands, [2]Pathology, Erasmus MC, Rotterdam, Netherlands*

Purpose: Alemtuzumab is an effective drug for the treatment of severe or glucocorticoid-resistant acute kidney allograft rejection (AR), but can also cause severe adverse events. There is a clinical need for superior treatment stratification to assess which patients will respond to alemtuzumab treatment. This study aimed to find clinical variables and gene expression profiles related to alemtuzumab treatment response in AR.

Methods: One hundred and thirteen patients from the Erasmus MC, that were treated with alemtuzumab for severe or glucocorticoid-resistant AR in January 2012 until January 2018 were included in this retrospective study. Clinical characteristics were retrieved from electronic health records. mRNA was isolated from formalin-fixed paraffin-embedded tissues of diagnostic kidney transplant biopsies and used for targeted gene expression profiling using the Banff-Human Organ Transplant panel of NanoString®. Response to alemtuzumab treatment was defined as allograft survival plus an estimated glomerular filtration rate (eGFR) above 30 mL/min/1.73 m^2 at 1 year after alemtuzumab therapy. The advanced analysis module of nSolver software and SPSS statistics were used to analyze the data.

Results: For clinical variable analysis, data of 101 patients (50 responders and 51 non-responders) was available and for gene expression analysis mRNA samples of 58 patients (29 responders and 29 non-responders) were available. Multivariate analysis identified three clinical factors that were associated with a good response to treatment: early timing of AR (<3 months after transplantation: 64% of responders and 41% of non-responders, p=0.002), a low delta eGFR between baseline eGFR and eGFR at the moment of AR (<25%/25-50%/>50%: responders:18/15/4 and non-responders: 11/11/15, p=0.01), and glucocorticoid maintenance therapy at the time of AR (90% of responders and 65% of non-responders, p=0.002). In addition, gene expression analysis revealed that genes involved in the B-cell receptor signaling pathway were related to inferior response to therapy.

Conclusions: Alemtuzumab treatment appears to be most effective in patients with severe or refractory AR in whom the diagnosis is made less than three months after transplantation, kidney function loss is limited and those who are on glucocorticoid maintenance therapy. Moreover, patients with high expression of B-cell receptor signaling genes are less likely to respond to alemtuzumab therapy. These findings can add to the development of superior stratification of patients who will benefit from alemtuzumab treatment.

Abstract# 117

Identification of Distinct Blood Monocyte Phenotypes from Transplant Kidney Recipients Undergoing Cellular (TCMR) and Mixed Antibody Mediated Rejection (ABMR)

C. Macedo, E. Bailly, K. Louis, M. Lucas, A. Zeevi, P. Randhawa, D. Metes, *Starzl Transplantation Institute, Pittsburgh, PA*

Purpose: Monocytes play an important role in immune defense by initiating adaptive immunity. They are heterogeneous, plastic, and present different subsets: classical ($CD14^{++}CD16^{-}$), intermediate ($CD14^{+}CD16^{+}$), and non-classical ($CD14^{dim}CD16^{++}$). While recent clinical studies have demonstrated a critical role for monocytes and macrophages to allo-immunity, a comprehensive phenotypic analysis of circulating blood monocyte subsets during rejection is still lacking. Here, we hypothesize that monocytes with distinct inflammatory programs may differently contribute to TCMR or mixed-ABMR after kidney transplantation (KTx).

Methods: Peripheral blood samples from 48 KTx were analyzed using 22 multi-color panel flow cytometry. Patients were classified as: Stable (without donor-specific antibodies (DSA), TCMR and/or ABMR before or at time of sample); TCMR (without DSA, at the time of a for cause biopsy Banff ≥1A); and mixed-ABMR (with DSA , at the time of a biopsy-proven mixed-ABMR). All samples were downsized to same number of monocytes and concatenated for unsupervised analysis by viSNE and FlowSOM, enabling visualization of high dimensional single-cell data. In addition, we performed scRNA-sequencing on bead-sorted monocytes from selected patients (n=3 from each group).

Results: Our results reveal significant phenotypic heterogeneity of blood circulating monocytes among the 3 groups. Specifically, TCMR patients displayed one unique classical $CD14^{++}CD16^{-}$ cluster that expressed low checkpoint inhibitory receptors (PD1/PDL-1), intermediate levels of CD11b (adhesion), CCR2 (migration), HLA-DR (antigen presentation) and of the scavenger receptor CD36. Conversely, monocytes from patients undergoing mixed-ABMR comprised of two activated, unique intermediate $CD14^{+}CD16^{+}$ cell clusters that expressed high CD32, CD86 (both activation markers) and CCR5 (chemokine receptor), but that differed in CX3CR1 (migration) and CD163 (scavenger) expression. None of these clusters were present in stable patients. Moreover, we identified 43 differentially expressed protein coding genes between TCMR and mixed-ABMR patients' circulating monocytes, including genes related to apoptosis modulation and signaling, Toll-like receptor signaling pathways, and IL1R associated kinases genes.

Conclusions: In conclusion, our data suggest that different monocyte subsets may contribute TCMR vs mixed-ABMR, suggesting the potential need for distinct therapeutic targeting of monocytes during cellular vs humoral rejection.

Abstract# 118

Validation of a Novel Gene Expression Biomarker of Rejection Following Liver Transplantation

J. Levitsky[1], M. Kandpal[1], T. Whisenant[2], K. Guo[1], S. Kurian[3], M. Abecassis[4], *[1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]University of California San Diego, San Diego, CA, [3]Scripps Clinic, La Jolla, CA, [4]University of Arizona College of Medicine Tucson, Tucson, AZ*

Purpose: Non-invasive biomarkers distinguishing early signs of immune activation vs. quiescence could more objectively guide immunosuppression management after liver transplantation (LT). Our aim was to validate blood-based gene expression profiles that can serially detect immune activation prior to acute rejection (AR) distinct from immune quiescence (non-AR).

Methods: Gene expression results in LT recipients with AR vs. non-AR (combination of other causes of graft dysfunction and normal graft function) were analyzed from two published cohorts (Northwestern University (NU); multicenter NIAID CTOT-14). A 70:30 approach (61 AR; 162 non-AR) was used for discovery and validation. Serial sample results before AR and non-AR were available in the CTOT-14 study (all <1 year post-LT). Microarray data was normalized utilizing a liver-specific fRMA vector. Variable selection was done using a specific variance (0.5), expression (8.0) and bootstrap (0.3) threshold.

Results: Random forest modeling was used to generate a classifier on the discovery set distinguishing AR vs. non-AR (AUC 0.83; accuracy of 0.78, sensitivity 0.70, specificity 0.81, PPV 0.54, NPV 0.89; F-score .61). The final 59 probe model and locked probability threshold performed well on the validation set (accuracy of 0.72, sensitivity 0.67, specificity 0.73, PPV 0.48, NPV 0.86; F-score 0.56). The probability

score line slopes were positive preceding AR and negative preceding non-AR and following AR treatment (all p<0.001; Figs. 1 & 2) in CTOT-14; the threshold was crossed at ~120 days prior to AR. Among the top 36 pathways that were significant using IPA (p <0.01) for the 59 probes, >40% were within immune response pathways, including allograft rejection.

Conclusions: We have developed a blood-based biologically relevant genomic biomarker diagnostic for AR that can be detected prior to AR-associated graft injury and distinct from non-AR. Prospective interventional trials are needed to evaluate its utility in precision-guided immunosuppression following LT.

COVID-19 Session 2

Abstract# 119

COVID-19 Potential Donor Derived Transmission Events Investigations: Early DTAC Experience

R. La Hoz, A. Agarwal, S. Aslam, K. Dunn, J. Goldman, D. Levine, C. Marboe, G. F. Marklin, S. M. Pouch, M. Rana, R. Razonable, H. L. Stevenson, H. Te, A. E. Woolley, M. Michaels, L. Danziger-Isakov, *OPTN DTAC, Richmond, VA*

Purpose: US Solid organ transplantation rates significantly decreased during the initial wave of the COVID-19 pandemic. The concern for potential donor derived COVID-19 was one of many contributing factors. We describe the early experience of the Organ Procurement and Transplantation Network (OPTN) Disease Transmission Advisory Committee (DTAC) Coronavirus disease 2019 (COVID-19) investigations.

Methods: COVID-19 cases reported to DTAC between January 2020 and October 2020 as potential donor-derived transmission events (PPDTE) were included. All of the events were investigated by the Centers for Disease Control and Prevention and adjudicated by the DTAC based on consensus definitions.

Results: Eighteen PDTE COVID-19 events were reported during the study period. 12 PDTE reports have completed DTAC adjudication (Table 1). These included 12 donors with 44 recipients. Ten investigations were initiated by the transplant center due to recipient testing (36 total recipients). The median time to presentation in these index cases was 11 days (IQR 7-16). Nine donors in these events (35 recipients) had a prospective or retrospective pre-recovery negative SARS-CoV-2 PCR result. In all of these events, the index recipient had either a possible or confirmed community or hospital exposure. In one recipient index case (5 total recipients), the positive SARS-CoV-2 PCR result post-transplant was ultimately deemed a false positive and considered not a case by the committee. Two investigations were initiated by an OPO (8 recipients). In both events, the OPO performed SARS-CoV-2 PCR was negative, but a post-procurement nasopharyngeal SARS-CoV-2 PCR performed by the tissue collector was reported as positive and retrospectively deemed false positives. None of these recipients developed COVID-19; the events were adjudicated as not cases.

Conclusions: The initial DTAC experience reflecting the early pandemic era emphasizes the need to implement hospital prevention measures to avoid nosocomial transmission, provide patient education to avoid community exposure and to recognize the possibility of post-procurement SARS-CoV-2 false positive testing. Vigilance for the possibility of a SARS-CoV-2 donor derived event remains important as the pandemic continues.

Summary of 12 Potential Donor Derived Transmission events investigated by DTAC between January 2020

Initial Report	Donors	Recipients	Proven/ Probable	Possible	Unlikely	Excluded	Not a case
Recipient	10	36	0	3	6	18	9
Donor	2	8	0	0	0	0	8

Abstract# 120

The Impact of Covid-19 Pandemic on Living Donor Liver and Renal Transplantations in Japan: A Nationwide Survey

S. Yamanaga[1], T. Hibi[2], R. Osawa[3], K. Yuzawa[4], H. Egawa[5], K. Kuramitsu[6], *[1]General Surgery, Japanese Red Cross Kumamoto Hospital, Kumamoto, Japan, [2]Pediatric Surgery and Transplantation, Kumamoto University, Kumamoto, Japan, [3]Infectious disease, Kameda medical center, Kamogawa, Japan, [4]Transplant Surgery, Mito Medical Center, Higashiibaraki District, Japan, [5]Gastrointestinal Surgery, Tokyo Women's Medical University Hospital, Shinjyuku-ku, Japan, [6]HBP surgery, Kobe University, Kobe, Japan*

Purpose: COVID-19 brought a huge impact on the field of organ transplantation. On 6th March, the Japan Society for Transplantation (JST) COVID-19 task force published an initial statement recommending the temporal suspension of non-life-threatening living donor transplant program. Until the revised statement documenting a stepwise reopening of transplant activity was released on 29th May, many transplant

centers suspended the living donor transplant program accordingly. We aimed to investigate the actual impact of COVID-19 pandemic on living donor liver and renal transplant programs and the efficacy of safety measures to sustain transplant activities.
Methods: On behalf of the JST, we performed an internet-based survey toward living donor liver and renal transplant centers nationwide in the study period (January ~ September). The survey was disseminated via e-mail to 165 living donor transplant programs including 32 livers and 133 kidneys. Centers performing both liver and renal transplants were requested to reply respective organs. This survey was funded by the Japanese government (Health and Labor Sciences Special Research Grants).
Results: The replies were collected from a total of 155 programs including 31 livers (97% response) and 124 kidneys (93% response). Ninety-three percent of centers followed the statement of JST. A total of 1262 living donor transplantations (229 livers, 1033 kidneys) were performed in the study period. The monthly numbers of liver transplantations did not drop, while kidney dropped 55% from the average during March through June. Preoperative safety measures were taken as follows (% indicates "yes"): SARS-CoV2 screening recipients "89%"/donors "88%", Chest CT recipients "69%"/donors "58%", and Self-quarantine (7-28 days) recipients "75%"/donors "65%". Ninety-five centers performed RT-PCR test for screening and samples were taken through nasopharyngeal, saliva, and nasal in 59%, 30%, and 23%, respectively. Mortality and morbidity of the waitlist patients were reported in 6.5% centers. Postoperative adverse events related to pandemic were occurred in 2.6% centers. Thirty-nine percent of outpatient visits were postponed, and 25% of centers set up tele-medicine accordingly.
Conclusions: Most of the living donor renal transplant programs were forced to experience temporal suspension while liver was not. A certain number of waitlist and postoperative patients were affected by COVID-19 pandemic. Standardized safety measures are required to keep the living donor transplant activities in this COVID-19 era.

Abstract# 121

T-Cell Responses in Solid Organ Transplant Recipients with SARS-CoV-2 Infection

V. H. Ferreira, T. M. Marinelli, T. Ku, M. Ierullo, B. Majchrzak-Kita, I. Bahinskaya, N. Pinzon, A. Humar, D. Kumar, *University Health Network, Toronto, ON, Canada*

Purpose: Preliminary data suggest solid organ transplant (SOT) recipients may be at high-risk for developing severe COVID-19. This may be due in part to alterations in T-cell physiology owing to use of immunosuppressive agents to prevent rejection. In this study we evaluated convalescent T-cell responses against SARS-CoV-2 in SOT recipients who had COVID-19.
Methods: Peripheral blood mononuclear cells (PBMC) were isolated from peripheral blood of 20 SOT recipients and 15 non-transplant controls (NTCs), all of whom had COVID >=14 days prior (convalescent samples). A total of 10^6 PBMCs were stimulated for 16 hours with megapools of overlapping 15mer peptides corresponding to the spike (S), nucleoprotein (NP) or membrane (Mb) protein of SARS-CoV-2 (each peptide at 5 μg/mL). After incubation, flow cytometry was performed for intracellular cytokines (IFN-γ, TNF-α, IL-2) and cell-surface T-cell exhaustion markers (CTLA4, PD-1, TIM-3). Total and SARS-CoV-2 antigen-specific CD4+ and CD8+ T-cells were identified. Polyfunctional T-cells were defined as those expressing ≥ 2 of the cytokines investigated.
Results: The median age among SOT recipients was 54 years (range 24-86). The majority (15/20) were male, and kidney (12/20) transplant recipients. The majority (60.0%) of SOT recipients were hospitalized with COVID-19; three (15.0%) required ICU admission and mechanical ventilation. SOT recipients had significantly lower total CD4+ T-cells (51.6% vs. 62.2%, p=0.002) but significantly higher proportions of total CD8+ T-cells relative to NTCs (41.9% vs. 31.2% of live CD3+ cells, p=0.0016). SOT recipients also had significantly higher proportions of PD-1 on total CD4 (15.2% vs. 3.7%, p<0.0001) and CD8 T-cells (9.4% vs. 4.1% of live CD3+ cells, p=0.014). The majority of SOT recipients and NTCs generated S, NP and Mb specific CD4 and CD8 T-cells. More specifically, compared to NTCs, SOT recipients had increased proportions of IFN-γ, or IL-2 producing CD4+ T-cells, as well as polyfunctional CD4+ T-cells reactive to S peptides. SOT recipients also had increased proportions of IFN-γ, IL-2 or TNF-α producing CD4+ T-cells, and CD4+ polyfunctional T-cells reactive to NP peptides. NTCs were also characterized by lower proportions of IL-2 producing CD8+ T-cells reactive to S peptides. Hospitalization of SOT recipients (severe illness) was associated with higher proportions of total PD-1+ CD4 T-cells (22.2% vs 13.3% of CD4 T-cells, p=0.02) and low frequencies of CD8+ polyfunctional T-cells reactive to NP peptides (5.80 vs. 49.9 per 10^6 polyfunctional CD8 T-cells, p=0.014).
Conclusions: Despite immune suppression, SOT recipients mount SARS-CoV-2 reactive T-cells at magnitudes often exceeding non-transplant controls. However, perturbations in global T-cell proportions, and increased expression of T-cell exhaustion markers, such as PD-1, may compromise the SARS-CoV-2-specific immune response.

Abstract# 122

Mortality, Risk Factors, and Treatment of Covid-19 Infection in Solid Organ Transplants: A Systematic Review and Meta-analysis

S. Yin, T. Song, Q. Zhong, T. Lin, *Urology Institute and Organ Transplantation Center, West China Hospital, Chengdu, China*

Purpose: Outcomes for solid organ transplants (SOT) with COVID-19 have not been summarized, and prognostic factors for COVID-19 in SOT patients are not well established yet.
Methods: We searched PubMed, EMBASE, and Cochrane library up to November 10, 2020, to identify reports of SOT patients and COVID-19. This study was performed to estimate the risk of death and other important outcomes. Further, we also evaluated the risk factors associated with mortality and severe COVID-19 infection in SOT patients. Pooled prevalence, odds ratios (OR), and 95% confidence intervals (CI) were calculated using a random-effects model.
Results: Fifty-nine studies involving 7071 SOT patients were included. 22% of SOT patients with COVID-19 were dead (20%-25%), 48% had acute kidney injury, 39% developed severe infection, 28% needed intensive care unit (ICU) admission, 35% had acute respiratory distress syndrome, and 23% needed invasive ventilation. Univariate analysis revealed that advanced age (OR=3.01, OR=2.97), obesity (OR=1.44, OR=2.05) and diabetes (OR=2.00, OR=1.73) were associated with severe infection and mortality. Laboratory abnormalities at admission including higher C reaction protein, D-Dimer, lactate dehydrogenase, procalcitonin, and lower lymphocyte also increased the risk of death. Initial MMF use (OR=1.61) contributed to severe infection, and tacrolimus (OR=1.70) led to more deaths. Further, calcinurin inhibitors withdrawal (OR=2.62), high dose steroids (OR=2.46), Tocilizumab (OR=1.75), ICU admission (OR=5.00), and invasive ventilation (OR=7.56) were associated with mortality.
Conclusions: Our study demonstrated that SOT patients with COVID-19 had a high mortality and risk factors identification may contribute to patients stratification and management.

Abstract# 123

Propensity Matched Analysis of Death and Non-favorable Discharge Among Hospitalized Transplant Recipients with COVID-19

J. T. Swan[1], E. Rizk[2], S. L. Jones[1], N. Nwana[1], J. C. Nicolas[1], A. Tran[1], T. Nisar[1], T. Menser[1], S. G. Yi[2], L. W. Moore[1], A. O. Gaber[2], R. J. Knight[2], *[1]Houston Methodist Research Institute, Houston, TX, [2]Houston Methodist Hospital, Houston, TX*

Purpose: This study compared death and non-favorable discharge following a hospital admission for Coronavirus Disease 2019 (COVID-19) management for patients with a history of solid organ transplant (SOT) vs without (control).
Methods: All non-pregnant adults who tested positive with symptomatic or asymptomatic COVID-19 and were admitted at a multihospital health-system from March 17, 2020 through August 24, 2020 were eligible for the study. Patients were excluded if their first positive COVID-19 test occurred >7 days before admission (potentially resolved) or >7 days after admission (potentially nosocomial). Patients not taking immunosuppression immediately prior to COVID-19 diagnosis were excluded from the SOT group. Outcomes included death at 60 days after admission and non-favorable discharge (death or hospice). To adjust for confounding due to differences in baseline demographics, a propensity score was calculated using age, sex, race, body mass index, hypertension, diabetes mellitus, chronic kidney disease, underlying liver disease, month of hospital admission, and area deprivation index (a surrogate for socioeconomic status). The matched cohort was generated using 1:1 nearest neighbor matching without replacement. Outcomes were analyzed using logistic regression that accounted for matching.
Results: Among 4,562 included patients (108 SOT recipients and 4,454 controls), 60-day death occurred in 17% SOT vs 10% control (P=0.033) and non-favorable discharge in 18% SOT vs 9% control (P=0.004). Among 214 matched patients (107 SOT recipients, 107 controls), 60-day death occurred in 17% SOT vs 9% control (OR=2.0, 95%CI=0.9 to 4.4, P=0.106) and non-favorable discharge in 18% SOT vs 9% control (OR=2.1, 95%CI=1.0 to 4.6, P=0.063). As expected, propensity matching reduced confounding due to differences in baseline characteristics (Table 1). Transplanted organs included kidney (*n*=64), liver (*n*=13), lung (*n*=12), history of >1 organ (*n*=13), and heart (*n*=5).

Conclusions: Recipients of SOT had a greater risk of 60-day death and non-favorable discharge among hospitalized patients with COVID-19 using unadjusted analysis. Preliminary data from the propensity matched analysis reported similar magnitudes of association but did not find statistical significance. A larger study may be needed to clarify whether immune-suppressed SOT recipients have greater risk of death or non-favorable discharge from COVID-19.

Balance of selected covariates before and after matching				
	SOT before matching (*n*=108)	**Controls before matching (*n*=4,454)**	**SOT after matching (*n*=107)**	**Controls after matching (*n*=107)**
Age, mean ± SD	56 ± 13	59 ± 17	56 ± 13	56 ± 17
Male gender, *n* (%)	61 (56%)	2,286 (51%)	61 (57%)	62 (58%)
BMI, mean ± SD	29 ± 6	32 ± 8	29 ± 6	30 ± 8
Chronic kidney disease, *n* (%)	68 (63%)	992 (22%)	67 (63%)	70 (65%)

Abstract# 124

Covid-19 Related Deaths Across the U.S. in Kidney Transplant Recipients

K. Goli, N. T. Galvan, R. Cotton, J. A. Goss, C. A. O'Mahony, A. Rana, *Department of Abdominal Transplantation, Baylor College of Medicine, Houston, TX*

Purpose: The COVID-19 pandemic poses a unique challenge for immunosuppression patients following kidney transplantation. Studies involving a single center or few centers have suggested that kidney transplant recipients generally have multiple other co-morbidities, such as diabetes and obesity, and are at high risk of developing the COVID-19 disease and mortality. This study aims to evaluate the nationwide impact of COVID-19 on mortalities in kidney transplant recipients.

Methods: The UNOS database was queried for kidney transplant recipient deaths in the year 2020, where cause of death was known or specified. The final sample consisted of 1804 patients who died this year. Percentages of deaths caused by COVID-19 in the kidney transplant population were graphed by month from January to September and mapped by UNOS region. Risk factors associated with deaths caused by COVID-19 that were found to be significant in a univariate logistic regression analysis were then entered into a multivariate logistic regression analysis to determine odds ratios (OR). Statistical significance was determined at α=0.05. STATA Version 13.0 and R were used for this analysis.

Results: After adjusting for over 30 covariates, UNOS region 9 was associated with significantly increased risk (O.R: 5.93 [4.23 - 8.29]) for deaths in kidney transplant recipients caused by COVID-19. The distribution of percentages of deaths caused by COVID-19 across the 11 UNOS regions is shown in Figure 1. A BMI ≥ 30 (O.R: 1.70 [1.24 - 2.33]), African American ethnicity (O.R: 2.92 [2.15 - 3.97]), Hispanic ethnicity (O.R: 3.65 [2.55 - 5.23]), and functional status of 90% at follow-up (O.R: 2.21 [1.07 - 4.58]) were associated with increased risk for death caused by COVID-19 in a kidney transplant recipient. Age ≥ 65yrs (O.R: 0.59 [0.44 - 0.79]) was associated with decreased risk for death caused by COVID-19 in a kidney transplant recipient.

Conclusions: These results are consistent with the accelerated increase health disparities caused by COVID-19. Obese patients who had a kidney transplant tend to be at a higher risk because of multiple co-morbidities. Additionally, patients who have a higher functional status and are thus more active may be more likely to get exposed to COVID-19 while on immunosuppression. In contrast, the elderly who are under immunosuppression may be more likely to remain at home and limit exposure to COVID-19.

Figure 1: Percentages of deaths caused by COVID-19 distributed by UNOS region

Abstract# 125

Impact of COVID-19 on Solid Organ Transplantation

E. Sampson[1], S. Hall[2], K. Robichaux[3], A. Kumar[2], N. Kemmer[4], J. Buggs[5], *[1]Lake Erie College of Osteopathic Medicine, Tampa, FL, [2]Morsani College of Medicine, University of South Florida, Tampa, FL, [3]Honors College, University of South Florida, Tampa, FL, [4]Transplant Hepatology, Tampa General Hospital, Tampa, FL, [5]Transplant Surgery, Tampa General Hospital, Tampa, FL*

Purpose: Patterns of racial disparities have been identified throughout the history of American medicine. In December 2019, COVID-19 was first detected and has had a significant impact at a global level. Evidence suggests that racial and ethnic minorities bear a disproportionate COVID-19 burden. Since the onset of the pandemic, there has been a decrease in the number of solid organ transplants (SOT) performed. The main objective of this study was to evaluate the impact of COVID-19 on the field of solid organ transplantation.

Methods: We conducted a retrospective cohort study on consecutive solid organ transplants performed in the U.S. before and after the onset of the COVID-19 pandemic from January 2019 through June 2020. We utilized national data from the United Network for Organ Sharing (UNOS) and the Organ Procurement Transplantation Network (OPTN). Deidentified data were analyzed on patients who underwent either kidney, liver, heart, lung, or combined heart and lung transplants. The number of transplants based on UNOS regions, age, gender, and ethnicity were analyzed.

Results: Our data demonstrated significant declines in liver transplants among ethnic minorities compared to the white population ($p<0.001$). In patients under 18, liver transplants were significantly reduced ($p<0.001$), while liver and heart/lung transplants were most impacted in the 18-49 age group ($p<0.001$). When comparing the number of SOTs by UNOS region, a significant decrease in kidney transplants was observed across regions 1, 7, 8, 9, and 10 ($p<0.001$). Additionally, liver transplants were markedly decreased in region 5 ($p<0.001$), as well as regions 4 and 7 ($p<0.05$). Finally, regions 2 and 9 demonstrated a statistically significant drop in heart/lung transplants ($p<0.05$).

Conclusions: Amid the pandemic, organ transplantation has been deemed a medical emergency and yet there has been a significant decline in the number of transplants across UNOS regions, age groups, genders, organ types, and ethnicities. Despite the unique challenges brought about by COVID-19, physicians have managed to continue to carry out lifesaving transplant procedures.

Abstract# 126

Covid-19 in Solid Organ Transplantation (SOT): Results of the National Covid Cohort Collaborative (N3C)

G. Agarwal[1], A. Vinson[2], R. Dai[3], E. French[4], S. Lee[5], A. Olex[4], A. Anzalone[6], V. Madhira[7], R. B. Mannon[8], *[1]Medicine, University of Alabama at Birmingham, Birmingham, AL, [2]Medicine/Nephrology, Nova Scotia Health Authority, Halifax, NS, Canada, [3]Biostatistics, University of Nebraska Medical Center, Omaha, NE, [4]Wright Center for Clinical and Translational Research, VIrginia Commonwealth University, Richmond, VA, [5]Medicine/Infectious Disease, University of Saskatchewan, Saskatoon, SK, Canada, [6]Neurology, University of Nebraska Medical Center, Omaha, NE, [7]Palia Software, Not sure, OR, [8]Medicine/Nephrology, University of Nebraska Medical Center, Omaha, NE*

Purpose: SARS-CoV-2 infection has resulted in significant mortality in solid organ transplant (SOT) recipients based on reports from single centers or voluntary registries. The N3C Enclave was developed to facilitate analysis of patient-level data across the US for multiple conditions, consisting of weekly electronic medical record (EMR) data extraction and transmission into a federally secured platform. Herein is our report of the largest cohort of US COVID-19 positive SOT patients to date.

Methods: We identified a cohort of SOT recipients who received a positive or negative COVID-19 test (COVID$^+$ and COVID$^-$, respectively) between 01/01/2020 and 11/23/2020. In COVID$^+$ SOT, we evaluated outcomes including requirement for hospitalization, major adverse cardiac events (MACE), and graft rejection and failure occurring until study end. Significant differences between COVID$^+$ and COVID$^-$ patients were identified using t-test and chi-square testing, as indicated.

Results: 34 sites account for 2.15 million patients in the Enclave, of whom 292,226 are COVID$^+$. We identified 19,031 SOT patients, of whom 2,183 were COVID$^+$ (11.5%) with a median follow-up time of 119 days. Demographics are shown in Figure 1. Compared to COVID$^-$ SOT patients, COVID$^+$ SOT patients were more likely to have a kidney transplant and be non-white or Hispanic. Hypertension, diabetes, coronary artery disease and chronic kidney disease were common comorbidities in all SOT, but significantly more common in those who were COVID$^+$. Of COVID$^+$ SOT, 51.8% required hospital admission for a median of 1 days (range 0-114). Following COVID diagnosis, 13.7% of COVID$^+$ SOT patients experienced MACE, 3.8% had graft rejection and 3.4% had graft loss over the study period.

Conclusions: In the largest US cohort of COVID$^+$ SOT recipients to date, we identify patient factors associated with the diagnosis of COVID-19 and outcomes following infection including a relatively high incidence of MACE. This is an evolving dataset and provides novel opportunities for analyses of COVID in SOT recipients on a granular level.

Abstract# 127

Findings from the Bareto Study: Associations Between Chronic Vascular Changes and 10-year Transplant Graft Outcomes

L. Kamal[1], D. Stewart[2], J. Foutz[2], H. McGehee[2], P. Saravanane[1], S. Yu[1], R. Yusfi[1], G. Gupta[1], *[1]Virginia Commonwealth University, Richmond, VA, [2]UNOS, Richmond, VA*

Purpose: As part of a broader study on Biopsy, Anatomy, and Resistance Effects on Transplant Outcomes (BARETO), we aim to characterize the poorly understood relationship between vascular changes and long-term kidney graft survival to help inform decision making.

Methods: DonorNet anatomy attachments were manually entered into electronic format for a preliminary cohort of 3,697 solitary, biopsied, ECD kidney transplants from 2008-2011. Chronic vascular changes (arteriosclerosis) were characterized as absent/minimal, mild (1-25%), or mild-moderate (26-50%)/severe(>50%). Analyses include Kaplan-Meier all-cause graft survival and 3 types of Cox models (propensity weighted, multivariable regression, and doubly robust regression (DRR)) to adjust for 19 possible confounders.

Results: Unadjusted, 10-year graft survival was slightly worse with more severe vascular changes (p=0.016, Fig 1). However, risk adjustment suggests these observed differences may be attributable to correlations with other factors, in particular glomerulosclerosis, interstitial fibrosis, CIT, and KDPI. Nominally, the graft failure hazard ratio for mild-moderate+ vs. absent/minimal was 1.19 (1.02, 1.37) but was attenuated to 1.12 (0.91, 1.34) in DRR (Fig 2).

Conclusions: Early results suggest renal vascular changes have little or no independent effect on post-transplant outcomes in a causal inference adjusting for confounding factors.

Abstract# 128

An HLA Class II Matching Strategy That Predicts De Novo Donor-specific HLA Antibody Formation Using Low Resolution HLA Types

L. Hidalgo[1], I. Martinez Juarez[2], L. Morales Buenrostro[2], S. Shojai[3], P. Campbell[1], *[1]University of Wisconsin Madison, Madison, WI, [2]Instituto Nacional de Ciencias Medicas Y Nutricion Salvador Zubrian, Mexico City, Mexico, [3]Medicine, University of Alberta, Edmonton, AB, Canada*

Purpose: The development of de novo donor-specific HLA antibodies (dnDSA) is predominantly against HLA-Class II antigens and is a function of the degree of HLA-DQ and -DR mismatch (MM) between donor and recipient. New methods to gauge HLA MM focus on predicted epitopes or amino acid differences rather than conventional HLA MM but ideally require high resolution HLA types that limits their common application. We examined whether a modified serology-based HLA-DR and -DQ matching strategy using low resolution HLA typing could similarly assess the risk for dnDSA.

Methods: We devised an HLA Class II MM strategy that groups Class II antigens (DRB1, DRB3/4/5, and DQB1) based on serologic relation (Figure 1). The incidence of dnDSA formation was examined in 349 kidney transplant recipients with negative DSA at time of transplant. This strategy was compared to eplet calculations and conventional HLA MM for the risk to develop dnDSA.

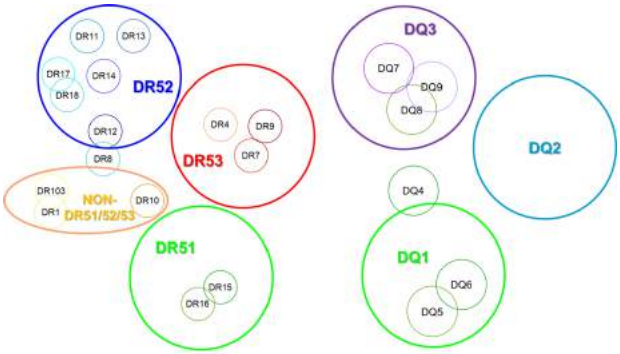

Figure 1. HLA-DR and -DQ groups used for modified, serology-based mismatch calculations.

Results: 95 patients (27.2%) developed Class II dnDSA between 0.5-32 years post-transplant. The incidence of dnDSA against HLA-DR gradually increased with the number of MMs outside of the serology-based groupings (p<0.001, Figure 2). Using a DR eplet MM threshold of 10 showed a subtler increased risk for dnDSA (p=0.019). The risk for dnDSA with DQ MMs outside serology-based groups also increased with number of MMs (p<0.006). DQ eplet MM threshold of 10 eplet MMs similarly assessed DQ dnDSA (p<0.006). Conventional antigen MM was unable to stratify dnDSA risk for DR but could stratify for DQ (p=0.004).

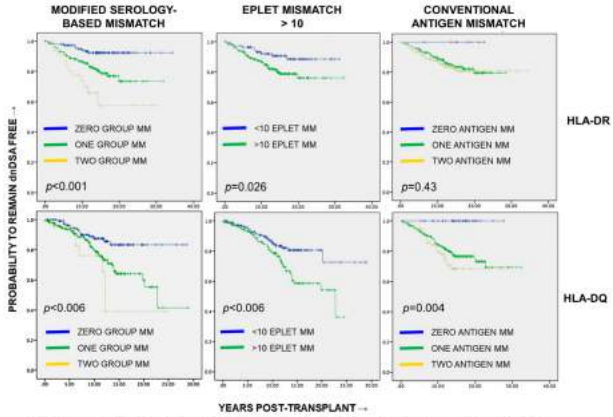

Figure 2. Comparison of three HLA mismatch assessment methods and the resulting incidence of dnDSA.

Conclusions: Our data suggest that dnDSA formation can be predicted using low resolution HLA typing and grouping of HLA antigens into serology-based groups. The associations with dnDSA were comparable to eplet mismatch calculations and better than conventional HLA matching. The simplicity of our matching strategy does not require imputations or high resolution HLA typing and may be an option for improved HLA matching from deceased donors or for programs with limited access to high resolution HLA typing resources.

Abstract# 129

Outcomes from High KDPI Kidneys Utilized for Dual Kidney Transplantation

J. Wagler[1], K. Mitchell[2], S. Ohara[3], R. Heilman[2], S. K. Reddy[2], H. Khamash[2], C. Jadlowiec[2], *[1]Mayo Clinic Arizona, Phoenix, AZ, [2]Mayo Clinic, Phoenix, AZ, [3]Valleywise Health General Surgery Residency Program, Phoenix, AZ*

Purpose: In light of the ongoing organ shortage, dual kidney transplantation (DKT), utilizing two adult kidneys from the same donor for one recipient, has been proposed as a means to expand the available donor pool. These kidneys often come from high Kidney Donor Profile Index (KDPI) donors (KDPI >85%). Data comparing outcomes of DKT with high KDPI single kidney transplants (SKT) remains limited.

Methods: We assessed 336 high KDPI kidney transplants performed at our center between 2003 to 2020. Pediatric high KDPI kidneys were excluded. Dual kidneys were selected based on biopsy findings of moderate-to-severe chronic changes, donor age ≥75 years, or kidneys coming from a small donor.

Results: Of the 336 high KDPI kidney transplant performed, 37 (11.0%) were DKT. Recipients of DKT were older in age (median 69.0 vs 67.0, p=0.02) and more likely to be diabetic (p=0.02). Donors for DKT had a higher KDPI score (median 96.0 vs. 91.0, p<0.0001) and were older in age (p<0.0001). For recipients, there were no differences in hospital length of stay (p=0.21) or rates of delayed graft function (54.1% vs. 51.5%, p=0.77). At one-year, eGFR was higher in the DKT cohort (52.7±23.9 vs 44.0±16.7, p=0.02). Time-zero biopsies had a more favorable profile for DKT kidneys. At one-year protocol biopsies were similar between DKT and SKT with DKT having more glomerulosclerosis (p=0.03) and arterial intimal thickening (p=0.01). One-year patient survival was 93.3% for DKT and 97.0% for SKT (HR 0.8, 95% CI 0.3-2.2, p=0.74); one-year graft survival was 93.3% for DKT and 91.6% SKT (HR 0.7, 95% CI 0.3-1.9, p=0.50).

Conclusions: Graft and patient survival rates with DKT are similar to those of SKT high KDPI kidneys despite the kidneys coming from donors with a higher KDPI score. DKT is a good option to help further utilize high KDPI kidneys and minimize discard. In our series, one-year eGFR with DKT was superior to that observed in solitary high KDPI kidneys.

Post-Transplant Outcomes			
	Dual Adult High KDPI n=37	**Single Adult High KPDI** n=299	***P* Value**
Hospital length of stay (median)	4.2±2.0 (4.0)	3.6±3.0 (3.0)	0.21
DGF	20 (54.1%)	154 (51.5%)	0.77
eGFR at 1 Year	52.7±23.9	44.0±16.7	0.02
eGFR <30 at 1 Year	2 (5.4%)	33 (11.0%)	0.29

Abstract# 130

Successful Outcomes from Selected Akin3 Donors Requiring Renal Replacement: Avenue for Increase in Organ Utilization

P. Budhiraja[1], R. L. Heilman[1], M. L. Smith[2], H. A. Khamash[1], L. Kodali[1], A. A. Moss[3], A. K. Mathur[3], C. Jadlowiec[3], K. S. Reddy[3], *[1]Medicine, Mayo Clinic, Phoenix, AZ, [2]Pathology, Mayo Clinic, Phoenix, AZ, [3]Surgery, Mayo Clinic, Phoenix, AZ*

Purpose: Our aim was to determine outcomes with transplanting kidneys from deceased donors with severe acute kidney injury requiring acute renal replacement therapy.

Methods: We included all patients who received deceased donor kidney transplant during 2008 to 2019. We compared the graft survival, estimated glomerular filtration rate (eGFR) and findings on surveillance biopsy in three groups of deceased donor kidneys: AKIN3 with RRT, AKIN3 without RRT, and <85% KDPI donors without AKI (AKIN 0).

Results: There were 172 recipients who received a kidney from donors with Acute Kidney injury stage 3 (AKIN3) requiring renal replacement therapy (RRT). We compared the study group to 528 recipients who received a kidney from donors with AKIN stage 3 not on RRT and 463 recipients who received Kidney Donor profile Index (KDPI)<85% AKIN stage 0 kidney. The study group donors were younger (p <0·001), and had lower KDPI (p <0·001) compared to the two control groups. The rate of Delayed Graft Function (DGF) was 91% in the AKIN 3 RRT compared to 76% in AKIN 3 no RRT group and 41% in the KDPI<85% AKIN 0 group (p=<0·001). Despite higher DGF, length of hospital stay and acute rejection within one year were similar between the groups. Primary graft failure was rare. Estimated GFR at 4 months, 1 year and 3 years were similar across the three groups. Death censored graft survival at 3 years was 93·5% in AKIN3-RRT group, 95% in the AKIN3 no RRT, and 91·7% in KDPI<85%AKIN0 (p=0·549). Interstitial fibrosis and tubular atrophy (IFTA) score ≥2 on protocol biopsy at 4 months and 1 year was similar across the three groups.

Conclusions: Transplanting selected kidneys from deceased donors with AKIN3 requiring RRT is safe and has excellent outcomes.

Abstract# 131

Outcomes of Kidney Transplant Recipients (KTRs) Comparing Brain Dead Donors' vs Donation After Cardiac Death Stratified by KDPI, Focus on Marginal Kidneys: A UNOS Database Analysis

B. Chopra[1], K. K. Sureshkumar[1], D. Rajasundaram[2], E. C. Rodrigo[3], *[1]Allegheny Health Network, Pittsburgh, PA, [2]UPMC, Pittsburgh, PA, [3]University Hospital Marqués de Valdecilla, Santander, Spain*

Purpose: In deceased donor kidney transplantation (DDKT), donation after cardiac death (DCD) is associated with increased cytokine release and renal tubular injury with consequent increase in the risk for delayed graft function (DGF). These cascade of events could increase acute rejection (AR) risk and potentially impact graft and patient survival. The impact of donation after brain death (DBD) vs DCD status on the long term outcomes following DDKT has conflicting reports in the literature especially for transplants from marginal donors. The aim of this study was to compare the outcomes of DDKT from DBD vs DCD in groups stratified by different degrees of kidney donor profile index (KDPI).

Methods: Using OPTN/UNOS database, we identified adult DDKT recipients from 2005 to 2019 who received induction followed by calcinurine inhibitor/ mycophenolate mofetil maintenance. Patients were divided into 4 KDPI groups: 0-20%, 21-50%, 51-84% and ≥85%. In each KDPI category, short and long-term outcomes including DGF, AR, adjusted overall graft, death-censored graft, and patient survivals were compared between patients who received kidneys from DBD vs DCD donors.

Results: There were 99548 DDKT recipients included in the study. Outcomes are shown in Table 1. Utilization of machine perfusion and the incidence of DGF were higher for kidneys from DCD donors across all KDPI groups (***=p <0.0001). The AR rates and patient survivals were similar for DBD vs DCD in all KDPI categories. The overall graft and death-censored graft survivals were similar in all KDPI categories except in 21-50% KDPI group, where DBD group had better outcomes (**= p<0.05). In particular, graft (over all and death-censored) and patient survivals were similar for DBD vs. DCD kidney recipients among the high KDPI (≥85%) group.

Results Table				
	KDPI (0-20%) N= 33581	KDPI (21-50%) N= 23400	KDPI (51-84%) N=33896	KDPI ≥ 85% N= 8671
	DBD= 27739 vs DCD=5842	DBD= 20900 vs DCD=2500	DBD=27,718 vs DCD=6178	DBD= 7792 vs DCD= 879
Machine perfusion (%)	24.5% vs. 46.4% ***	15.7% vs. 40.6% ***	19.3% vs. 43.4% ***	34.4% vs 48.8% ***
Delayed Graft Failure (%)	27.3% vs. 45.5% ***	14.9% vs. 32.9% ***	22.7% vs. 42.8% ***	29.9% vs. 48.2% ***
Acute Rejection (%)	6.4% vs. 6.3%	5.1% vs. 5.5%	5.8% vs. 6.4%	7.5% vs. 6.1%
Adjusted Graft Survival [HR(95%CI)]	0.99 (0.94-1.05)	1.12 (1.01-1.23) **	1.00 (0.94-1.07)	1.02 (0.94-1.07)
Adjusted Death censored Graft Survival [HR(95%CI)]	1.02 (0.94-1.1)	1.21 (1.06-1.39) **	1.02 (0.93-1.12)	1.03 (0.85-1.19)
Adjusted Patient Survival [HR(95%CI)]	1.04 (0.96-1.1)	0.94 (0.83-1.07)	1.02(0.94-1.1)	0.99 (0.86-1.15)

Conclusions: Despite the increased incidence of DGF in DCD kidney recipients, long-term graft and patient outcomes were similar between DBD and DCD groups across KDPI categories. This observation is particularly important in the highest

KDPI group where there is still higher rates of organ discard. Our findings support more robust utilization of kidneys from DCD donors for transplantation especially from the higher KDPI groups in order to alleviate existing organ shortage.

Abstract# 132

Expanding A_2 to B Kidney Transplantation: Safe and Effective Use of Recipients with High Titer Antibodies

A. Gilbert[1], S. Radomski[2], J. Verbesey[1], J. Vucci[1], M. Cooper[1], *[1]Medstar Georgetown Transplant Institute, Washington, DC, [2]Department of Surgery, Johns Hopkins Medical Center, Baltimore, MD*

Purpose: Minor ABO incompatible (ABOi) transplants from blood group A_2 or A_2B donors have increased since 2014, but virtually all centers limit recipients to having anti-A titers of 1:4 or less. We reviewed our center's experience transplanting patients with higher anti-A titers and their longer term outcomes.
Methods: This is a single center retrospective study. We reviewed all patients who received kidneys from donors across minor ABOi. At our center, these patients are transplanted using our standard protocol including induction with lymphodepleting antibodies and a maintenance regimen of tacrolimus and mycophenoloic acid. No plasmapheresis or other treatment was given to any patient regardless of titer. Recipients were classified as having either high anti-A_2 titers (1:8 or greater) or low anti A_2 titers (1:4 or less). Outcomes included graft loss and biopsy proven rejection as well as 3 month and 12 month serum creatinine. Outcomes were evaluated using Kaplan-Meier plots compared with the Mantel-Cox long rank test.
Results: Since December of 2014 we performed a total of 70 transplants across minor ABOi. These included 56 deceased donor transplants from A_2 or A_2B donors into blood group B recipients, 14 living donor A_2/A_2B to group B transplants, and 10 living donor A_2/A_2B transplants into O recipients. Of these, 22 were high titer: 1:8 (n=11), 1:16 (n=6), 1:32 (n=5) and 48 were low titer. Follow up was similar in each group with mean follow up of 20 months in the high titer group (range 3-40 months) and 21 months in the low titer group (range 3-54 months). There was no statistically significant difference in graft survival (figure 1) between the groups, nor was there a statistically significant difference in the composite endpoint of rejection or graft loss (figure 2). At 3 months, serum creatinine was similar between the groups (median 1.41 vs 1.42, mean 1.58 vs 1.52, p=ns). 12 month serum creatinine was also statistically similar (median 1.47 vs 1.27, mean 1.58 vs 1.52 p=ns).
Conclusions: With modern immunosuppression, high-titer recipients show excellent results which are fully equivalent to results in low titer recipients of minor ABOi transplants.

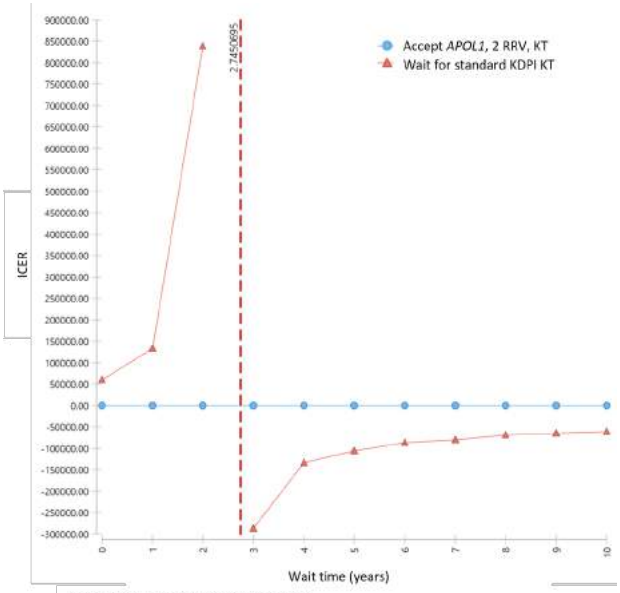
Abstract# 133

How Long is the Wait Worthwhile: Cost-Effectiveness of Accepting a Kidney from a Donor with Apolipoprotein L1 High-Risk Genotype

K. Lentine[1], D. Brennan[2], M. Wang[3], M. Schnitzler[4], H. Xiao[4], D. Axelrod[5], J. Snyder[6], K. Lentine[4], *[1]Saint Louis University, St. Louis, MO, [2]Johns Hopkins, Baltimore, MD, [3]Washington Univ, Saint Louis, MO, [4]Saint Louis Univ, Saint Louis, MO, [5]Univ of Iowa, Iowa City, IA, [6]SRTR, Minneapolis, MN*

Purpose: The Apolipoprotein *L1* (*APOL1*) Long-Term Outcomes (APOLLO) study is underway to define the impact of kidney donor renal risk variants (RRVs) on the survival of kidney transplants (KTs) from African American donors. Pending completion of APOLLO, we conducted a preliminary cost-effectiveness analysis comparing acceptance of KT allografts with high-risk (2 RRV) *APOL1* genotype versus waiting for standard Kidney Donor Profile Index (KDPI) <85% KTs.
Methods: Discrete event simulation models with a lifetime horizon were constructed from the perspective of Medicare for 100,000 patients aged 50 to 60 years. Distributions of time to graft failure, dialysis, and death were estimated from the national Scientific Registry of Transplant Recipients (SRTR) data (2010-2019) for standard KDPI KT outcomes. Published evidence available to date was used for *APOL1*, 2 RRV, KT outcomes, and costs and utilities. Costs were evaluated at the 2020 price level. Both costs and effectiveness were discounted at an annual rate of 3%. Analyses were conducted using MATLAB (R2020b, MathWorks Inc, Natick, MA).
Results: Accepting an *APOL1*, 2 RRV, KT yielded averages of 6.83 quality-adjusted life years (QALYs) and lifetime cost of $294,006 ($43,046/QALY). If standard KDPI KT were available immediately (wait time=0), standard KDPI KT would yield 8.29 QALYs and lifetime cost of $381,769 ($46,052/QALY). As the wait time for standard KDPI KT increased, average QALYs decreased, and lifetime costs increased due to longer dialysis waiting times for standard KDPI KT while facing a risk of death on the waiting list. When the wait time was longer than 2.7 years, an *APOL1* 2 RRV KT became cost-saving (higher QALYs and lower costs, see Figure).



ICER: Incremental cost-effectiveness ratio
= (Cost of standard KDPI KT-Cost of *APOL1*, 2 RRV, KT)/(QALYs for standard KDPI KT-QALYs for *APOL1*, 2 RRV, KT)

Figure. Threshold analysis for the value of accepting *APOL1*, 2 RRV KT compared to waiting for standard KDPI KT

Conclusions: Our preliminary analysis demonstrates that accepting an *APOL1* 2 RRV KTs may be cost-saving if the expected wait time for a standard KDPI kidney is longer than 3 years. The APOLLO study will enable refinement of these estimates.

Liver

Hemodynamic Consequences of Portal Hypertension Including Kidney Issues

Abstract# 134

The Rate of Hospitalization Among Patients with Cirrhosis is More Than Twice as High as Patients Over 85 Years

N. R. Mazumder[1], K. Guo[2], L. Zhao[3], A. Kho[1], K. Walters[4], T. S. Carey[4], C. Loftus[1], D. P. Ladner[1], *[1]Northwestern Memorial Hospital, Chicago, IL, [2]Biostatistics, Northwestern Memorial Hospital, Chicago, IL, [3]Biostatistcs, Northwestern Memorial Hospital, Chicago, IL, [4]University of North Carolina Chapel Hill, Chapel Hill, NC*

Purpose: Cirrhosis is a common disease however it is understudied because population data on patients with cirrhosis is lacking. While the risk of hospitalization in the general population in 2017 was 6.5% per year and in patients 85 yrs or above was 22% per year, little is known about the risk for hospitalizations in patients with cirrhosis. We used National Patient-Centered Clinical Research Network (PCORnet) data to examine this question.

Methods: PCORnet data from two centers between 2012-2018 were used and patients with cirrhosis were identified through an algorithm of ICD-9, ICD-10, or RXCUI codes. Only adult patients (>18yrs) were included. Demographics were assessed and hospitalizations were calculated.

Results: 62,580 patients with cirrhosis were identified with 87,489 patient-years of follow up. Patients mean age was 51.25 yrs, 38.2% were Female, 38.3% were White, and 51.6% were Black. The mean MELD-Na was 11.0.During the study period patients had 171,397 emergency visits and underwent 41,643 admissions, or 45.6 hospitalizations per 100 patient-years of follow up. Patients were admitted for a total of 330,469 days (904.8 patient-years) or 1.03 days admitted per 100 days of follow up. Patients with cirrhosis had a seven times higher rate of hospitalization than the general population and a 2.1 times higher rate than patients over 85 years old, the highest risk subset of the general population.

Conclusions: Hospitalizations are very frequent in patients with cirrhosis. Large datasets may provide insight into prevention of hospitalizations.

Abstract# 135

A Novel Liver Assist Device as a Bridge to Liver Transplantation in Acute on Chronic Liver Failure Patients with Multi-Organ Failure

S. Ahmad[1], I. W. Liou[1], J. Reyes[2], R. Bakthavatsalam[3], N. C. Smith[4], R. L. Carithers[1], C. Martin[1], D. Gao[5], *[1]Medicine, University of Washington, Seattle, WA, [2]Surgery, University of Washington, Seattle, WA, [3]Surgery, University of Washington, Seattle, WA, [4]Nursing, University of Washington, Seattle, WA, [5]Engineering, University of Washington, Seattle, WA*

Purpose: Acute on chronic liver failure (AOCLF) occurs in nearly 25% of patients with acutely decompensated cirrhosis, with many developing multi-organ failure requiring ventilatory, vasopressor and dialysis support, and in the most severe cases, they become unsuitable for liver transplantation. The 28-day mortality with 3 or more organ system failure is 75-90%. Trials of liver assist devices to improve clinical condition allowing transplantation have been disappointing. Purpose of the study was to improve outcome in AOCLF patients with more than 3 organ failure.

Methods: A modified hemodialysis machine with added albumin circuit (MAHD) was developed and used at University of Washington in 10 AOCLF patients with more than 3 organ failures. All patients were made inactive on the liver transplant wait list, once their encephalopathy worsened, they developed respiratory failure requiring mechanical ventilation, became hypotensive requiring vasopressors, and/or developed large fluid excess with renal failure needing hemodialysis. In all patients the MELD scores were over 40, bilirubin more than 5 mg/dL, with elevated ammonia levels and there was presence of active bleeding from various sites.

Results: With the use of the MAHD, all patients were eventually extubated, with significant improvement in encephalopathy to baseline status, discontinuation of vasopressor support, and removal of large volumes of extracellular fluid. Four patients underwent liver transplantation, and one recovered liver function and came off the transplant wait list. Five patients died while waiting for a liver, for a period ranging from 12 - 74 days. The causes of death were bleeding (n=4), sepsis (n=3), and stroke and cardiac arrest (n=1), (some patients had more than one cause of death).

Conclusions: In this limited study, the 28-day survival of 90% was better than expected, and the ability to reactivate wait list status was achieved in all patients (100%), with successful liver transplantation and one native liver recovery seen in 50% of patients (Figure). MAHD was very effective in fluid removal while traditional HD was ineffective. No complications of this treatment were encountered. Thus, MAHD appears to be successful as a bridge to transplantation in patients with AOCLF. The major limitation of the study is the small number of patients.

Abstract# 136

Rabbit Anti-thymocyte Globulin Induction is Not Associated with Improved Outcomes in Liver Transplant Recipients

P. Nguyen, N. Wilson, G. Saracino, R. Patel, S. K. Asrani, G. Testa, T. Sam, *Baylor University Medical Center, Dallas, TX*

Purpose: Controversy remains on the role of rabbit anti-thymocyte globulin (rATG) induction for calcineurin inhibitor (CNI) delay after liver transplantation (LT). We examined the effect of rATG with and without CNI delay on outcomes after LT.

Methods: We analyzed primary LT recipients from 01/2016 to 06/2020. Combined LT and cardiothoracic transplant were excluded. Analysis was performed based on rATG receipt and CNI initiation ≥ 3 days post-LT. Infection was assessed by provider notes, medications, and lab results. Rejection was defined as biopsy-proven or clinically diagnosed by lab values.

Results: Of 528 eligible patients, 110 received rATG and 418 did not. RATG group was younger, had higher MELD-Na scores, and had more females. Renal function was not different at baseline or at 1 year. Patients receiving rATG had significantly higher rates of bacterial infection (50%, vs 26%, p<0.001). However, survival and rejection rates were not different at 1 year. We examined a subset of patients that had CNI delay ≥ 3 days post-transplant. In this subset, those that received rATG had worse renal function over a year (p<0.001).

Conclusions: Use of rATG was not associated with improved patient/graft survival but resulted in more bacterial infections. In the setting of CNI delay, use of rATG resulted in significantly worse renal function. The use of rATG in renal preservation strategies above and beyond CNI delay needs to be reconsidered.

Abstract# 137

Effects of Timing of Everolimus Transition on Renal Outcomes in Liver Transplant Recipients

M. Leick[1], H. Belleau[2], T. McCashland[3], *[1]Nebraska Medicine, Omaha, NE, [2]Bryan Health, Lincoln, NE, [3]University of Nebraska Medical Center, Omaha, NE*

Purpose: The purpose of this study is to evaluate the effects of the timing of everolimus transition on renal outcomes in liver transplant recipients.
Methods: This retrospective review included adult liver transplant recipients from 01/01/2013 to 05/31/2018. Patients transitioned to everolimus were included in this subgroup analysis. Patients were separated into groups based upon timing of transition: group 1 (<90 days), group 2 (91-180 days), group 3 (181-365 days), and group 4 (>365 days). The primary outcome was renal function (creatinine clearance (CrCl) per Cockcroft-Gault equation) at 1 month post-transition compared to baseline. Secondary outcomes included renal function at 12 months post-transition and biopsy proven acute rejection (BPAR) following conversion. Paired *t*-tests were used for analysis.
Results: Of 350 adult liver transplants during the study period, eighty patients were transitioned to everolimus in combination with other immunosuppression or as monotherapy according to physician discretion. Group 1 included 25 patients, group 2 had 20, group 3 had 19, and group 4 had 16. The average age was 56.2 years; the majority were male (67.5%) and Caucasian (90%). The most common indications for transplant were nonalcoholic steatohepatitis (26.3%), hepatitis C virus (25%), and alcohol (23.8%). Hepatocellular carcinoma was present in 27.5% of patients. Average MELD and MELD-NA was 22.8 and 24.2, respectively. Renal sparing induction with antithymocyte globulin occurred in 37.5%. Group 1 had a mean CrCl 45.4 ml/min at time of transition, which significantly improved at 1 month and 12 months (69.6 and 61.6 ml/min, p=0.004 and 0.035). Group 2 had mean CrCl 43.9 ml/min at time of transition, which also significantly improved at 1 month and 12 months (60.7 and 57.5 ml/min, p=0.02 and 0.008). Group 3 had a mean CrCl 52.6 ml/min at time of transition, which significantly improved at 1 month but not at 12 months (63.8 and 55.2 ml/min, p=0.0004 and 0.43). Group 4 had a mean CrCl 54.6 ml/min at time of transition and did not show renal improvement at 1 month or 12 months (58.6 and 49.6 ml/min, p=0.2 and 0.84). BPAR occurred in 40% of group 1, 20% of group 2, 10.5% of group 3, and 6.25% of group 4. Median time to rejection (days) following transition for each group was 87.5, 108, 220.5, and 85, respectively.
Conclusions: Early everolimus conversion (less than 180 days) showed improvement in renal function in adult liver transplant recipients, while later transition did not show the same sustained renal benefit. Early transition also showed higher rates of BPAR. Our data would suggest conversion was optimal for renal function and BPAR rates 181-365 days from transplant. Timing of everolimus transition must balance the risk of rejection with the benefit of renal improvement.

Abstract# 138

Machine Perfusion of Kidney Grafts in Simultaneous Liver Kidney Transplantation: National Trends and Outcomes

A. Chang[1], M. Chen[1], P. Abt[1], T. Bittermann[2], *[1]Surgery, University of Pennsylvania, Philadelphia, PA, [2]Gastroenterology, University of Pennsylvania, Philadelphia, PA*

Purpose: In this study we analyze the SRTR liver data set to determine the trends in machine perfusion of kidney grafts prior to SLK and its effect on graft function.
Methods: This was a retrospective cohort study of 6,594 SLK recipients between 2005-2020 using the United Network for Organ Sharing database. Differences in recipient and donor characteristics according to use of kidney allograft MPP were compared. Temporal and geographic trends were assessed. Multivariable logistic regression was used to evaluate predictors of MPP. Multivariable logistic regression and Cox regression were used to assess the relationship between MPP and kidney delayed graft function (DGF) and graft survival, respectively.
Results: Overall, 17% (n=1,134) of SLK kidney allografts were placed on MPP. Nationally, the utilization of machine perfusion in SLK has increased from under 3% in 2005 to 25% in 2020 (Figure 1), however significant center variability exists. Allografts that underwent MPP were older (median 36 vs 34 years old, p<0.01), had a higher incidence of donor diabetes (6.3% vs 4.2%, p<0.01), came from DCD donors (7.9% vs 4.5%, p<0.01), and had longer cold ischemic time (12.9 vs 9.9 hours, p<0.01). However, center preference was the primary determinant of MPP use (intraclass correlation 64%; i.e., only 36% of variability in MPP use was explained by donor or recipient factors). In multivariable analysis, a possible trend towards reduced DGF with MPP was observed (OR 0.81, p=0.08), while adjusted graft survival was not different (HR 0.95, p=0.54).
Conclusions: Despite increasingly widespread use of MPP for storage of kidney allografts prior to transplantation, this technique does not appear to alter outcomes in simultaneous liver and kidney transplantation.

Abstract# 139

Outcomes of Transjugular Intrahepatic Portosystemic Shunts (TIPS) in Dialysis-Dependent ESLD Patients: The ALTA Study

J. Ge[1], J. Boike[2], M. German[3], G. J. Morelli[4], E. Spengler[3], A. Said[3], A. S. Lee[3], A. Hristov[3], A. Desai[5], T. Couri[6], S. Paul[6], C. Frenette[7], N. Christian-Miller[7], M. Laurito[8], E. Verna[8], U. Rahim[9], A. Goel[9], D. Gregory[2], L. VanWagner[2], K. P. Kolli[1], J. Lai[1], *[1]University of California, San Francisco, San Francisco, CA, [2]Northwestern Memorial Hospital, Chicago, IL, [3]University of Wisconsin, Madison, WI, [4]University of Florida Health, Gainsville, FL, [5]Indiana University School of Medicine, Indianapolis, IN, [6]University of Chicago, Chicago, IL, [7]The Scripps Clinic, La Jolla, CA, [8]Columbia University, New York, NY, [9]Stanford University, Stanford, CA*

Purpose: Data on the outcomes of patients with cirrhosis who require renal replacement therapy (RRT) at the time of transjugular intrahepatic portosystemic shunts (TIPS) is exceptionally limited. We aimed to describe the outcomes of this patient population.
Methods: Adult patients with cirrhosis who underwent TIPS in the retrospective portion of the Advancing Liver Therapeutics Approaches (ALTA) Study from 2010-2015 were included. We grouped patients based on RRT status at TIPS, defined as ≥2 RRT encounters in the 28 days prior to TIPS. We calculated the relative risks of death and transplantation and used competing risk regressions (competing event = transplantation) to estimate the subhazard of death at 1-year.
Results: Of 1,260 patients, 57 (4.5%) required RRT prior to TIPS. Of those 57, 60% (34) had RRT 2-28 days and 40% (23) had RRT within 2 days prior to TIPS. RRT patients had higher median MELD-Na (31 vs 17, p<0.01), INR (1.6 vs 1.5, p=0.04), bilirubin (2.8 vs 1.8mg/dL, p<0.01), and creatinine (2.4 vs 1.0mg/dL, p<0.01) at TIPS. RRT patients had a higher prevalence of heart failure (HF) at 19.3% vs 6.6% for the non-RRT group (p<0.01). At 1-year post-TIPS, the RRT group had substantially higher rates of death and transplant versus the non-RRT group at 51% vs 25% (p<0.01) and 19% vs 128% (p<0.01), respectively. The relative risks (RR) of death and transplantation for RRT vs. non-RTT groups were 2.7 (95%CI 2.04-3.57, p<0.01) and 2.1 (95%CI 1.29-3.36, p<0.01), respectively, at 1-year. Of those who died, median times to event were 11 days (IQR 3-32) in RRT and 42 days (IQR

13-134) in non-RRT patients. Adjusted (for age, bilirubin, INR, and HF) competing risk regression showed a subhazard ratio of 2.56 (95%CI 1.47-4.46) for death in RRT compared to non-RRT patients.
Conclusions: In one of the largest studies of patients who require RRT at the time of TIPS, we found RR of death in RRT patients was 2.7 times that of non-RRT patients. Death occurred rapidly at median of 11 days. More investigation is required to determine whether the increased risk of mortality experienced by end-stage liver disease patients who require RRT is due to the TIPS procedure or an artifact of a higher baseline mortality rate.

Abstract# 140

Home-based Liver Frailty Intervention (lift) in Liver Transplant Candidates: A Pilot Study

A. J. Thuluvath[1], K. Belfanti[1], S. Morrissey[1], O. Siddiqui[1], J. Peipert[1], A. Daud[1], J. Levitsky[1], T. Bogg[2], A. Flores[1], D. P. Ladner[1], *[1]Northwestern University Transplant Research Collaborative, Chicago, IL, [2]Department of Psychology, Wayne State University, Detroit, MI*
Purpose: Frailty is highly prevalent in patients awaiting LT and is associated with increased waitlist and post-transplant mortality, hospitalizations and LOS. While reduction of frailty is known to improve outcomes, logistically simple and affordable interventions are lacking. In this ongoing pilot study, we tested the feasibility and effectiveness of an evidence-informed home PT intervention to decrease frailty in LT candidates.
Methods: In a single-center prospective study, adult patients were enrolled starting in 10/2020. The "LIver FrailTy" (LIFT) intervention consisted of a baseline evaluation (LFI, 4-meter gait speed [4MGS]), individualized home exercise regimen (with dumbbells, exercise bands), monitoring (smart phone exercise tracking, remote LFI measurement) and check-ins (email reminders, weekly phone calls). Clinical details were extracted from the EHR. Primary outcomes reported are LFI change over time and exercise adherence.
Results: 21 LT candidates were enrolled between 10/2020-12/2020 (expecting enrollment of 150 by 5/2021). Mean age was 54.3 (±10.4) yrs, 12 (57%) were female, 76% White, 10% Black, 10% Hispanic and mean BMI was 30. Cirrhosis etiologies were Biliary (29%), NASH (19%), ETOH (14%), HCV (14%), and Other (24%). The mean MELD was 14.9 (±6.1) and 48% had decompensated cirrhosis. Mean baseline LFI was 3.65 (±0.59) with 5 (26%) robust, 13 (69%) pre-frail and 1 (5%) frail. Baseline grip strength was 27.1 (±10.1) kg and 4MGS was 2.82 (±0.64) sec. Exercise adherence was 56%. The exercise regimen was adjusted 1x for 3 patients, 2x for 1 patient and 3x for another based on patient feedback. Since enrollment (mean time 37 days), no patients developed new decompensating events, received a LT or died. Of the 8 patients who had a repeat LFI measured at 1 month after enrollment, the mean change in LFI was -0.06. LFI improved in 7 (88%) patients and worsened in 1 patient, who was hospitalized 2x during the study period including an ICU stay.
Conclusions: We demonstrate feasibility of a home-based liver frailty intervention. We aim to enroll 150 patients, follow them longitudinally by 5/2021 and present correlations with clinical outcomes (hospitalization, complications and mortality).

Abstract# 141

Kidney Transplantation Alone in Patients with Compensated Cirrhosis: A Multicenter Study

A. Kassem[1], S. Asrani[1], S. W. Biggins[2], Y. Darwish[1], M. Nadim[3], B. Fischbach[1], T. Fong[3], *[1]Baylor University Medical Center at Dallas, Dallas, TX, [2]University of Washington, Seattle, WA, [3]USC - Keck, Los Angeles, CA*
Purpose: Patients undergoing kidney transplant (KTA) often have risk factors for liver disease including viral hepatitis and non-alcoholic fatty liver disease (NAFLD). Recent European Association for the Study of the Liver (EASL) and Kidney Disease: Improving Global Outcomes (KDIGO) guidelines recommend kidney transplant alone in patients with cirrhosis without portal hypertension. However, there is limited data on long term outcomes, especially in patients without hepatitis C (HCV). We hypothesized that compensated cirrhosis patients are still at risk for liver related complications after KTA.
Methods: We performed a multi-center study (Baylor University Medical Center at Dallas, Baylor Scott & White All Saints Medical Center, Keck Hospital of University of Southern California, and University of Washington) to assess clinical outcomes in cirrhosis patients undergoing KTA. Clinical outcomes included liver decompensation, hepatocellular carcinoma (HCC), and death. Baseline patient characteristics and outcomes were evaluated over a 5-year period post-KTA.
Results: Across the four centers, 30 KTA recipients were identified to have cirrhosis before or after transplant between 1999-2019. The median age of the patient population was 57 years (IQR 48.5-61.5). 14 of the patients carried a diagnosis of cirrhosis prior to KTA, while 16 were diagnosed after-KTA. Cirrhosis etiologies included HCV (33.3%), alcohol-related liver disease (10%), and NAFLD (26.7%). In total, 6 patients had portal hypertension and grade 1 esophageal varices, with 4 of these patients having been identified prior to transplantation. Early liver decompensation as a result of kidney alone transplant was rare. Within the first year post-KTA, only one patient developed ascites and progressed to CP class B, requiring a liver transplant. 2 patients developed ascites 3-years post-KTA, while 3 patients developed ascites 5-years post-KTA. However, 2 patients developed HCC 1-year post-KTA, and one patient developed HCC 5 years post-KTA. One patient died at the 1-year time point, no patients died at the 3-year time point, and two died at the 5-year time point.
Conclusions: Diagnosis of cirrhosis is common after KTA and may be related to inadequate workup for NAFLD. KTA in compensated cirrhosis is feasible. However, complications of portal hypertension, re-transplantation, liver cancer and death were observed in 40% unique patients within 5 years after KTA. Continued vigilance and surveillance is needed, especially after introduction of recent guidance by relevant professional societies. This is especially important given the increasing burden of NAFLD in patients being evaluated for kidney transplantation.

Abstract# 142

Pregnancy Outcomes in 108 Heart Transplant Recipients

L. A. Coscia[1], A. Yusuf[1], S. Rao[2], S. Constantinescu[3], M. J. Moritz[4], *[1]Transplant Pregnancy Registry International, Philadelphia, PA, [2]University of Virginia Heath System, Charlottesville, VA, [3]Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [4]Surgery, Lehigh Valley Health Network, Allentown, PA*
Purpose: The purpose of this study was to describe 185 pregnancies in 108 heart transplant recipients.
Methods: Data regarding conceptions occurring between June 1987 and Dec 2019 were collected by the Transplant Pregnancy Registry International (TPRI) via questionnaires, telephone interviews, and medical records. There were 5 recipients included from outside of North America.
Results: The mean age at first transplant was 20±8.4 yrs (range 0.5-39.4 yrs). The transplant to conception interval was 7.7±6.1 yrs (range 0.15-26 yrs) and 44% of the pregnancies were reported as unplanned. Immunosuppression was calcineurin inhibitor-based with 20% exposed to a mycophenolic acid product (MPA). Comorbid conditions during pregnancy included: hypertension 49%, preeclampsia 29%, and diabetes requiring insulin 8%. Rejection occurred during 14 pregnancies (8%) and within 3 months post-partum in 11 pregnancies. Graft loss within 2 years of delivery occurred in 3 recipients; 1 recipient was successfully re-transplanted. Pregnancy outcomes (n=190, includes multiple births) included: 129 live births (16 with MPA exposure), 49 miscarriages (23 with MPA exposure), 8 terminations, 2 ectopic and 2 stillbirths. Of the 129 newborn the mean gestational age was 36.2 ± 3.4 wks and mean birth weight was 2586 ± 713 g; 42 children were breastfed. Birth defects were reported in 10 children and included: duodenal atresia, AV canal defect, Tetralogy of Fallot (MPA exposure); facial deformities (MPA exposure), laryngomalacia (MPA exposure), cystic hygroma, vermian hypoplasia of the cerebellum, hypospadias, undescended testicle, pectus excavatum, hydronephrosis, and tongue-tie. Seven children inherited their mother's cardiac disease; 4 children have received a heart transplant. At last follow-up, mean 8.5 ± 6.8 yrs, 36 recipients had died (average age of their 40 children at time of maternal death was 10.2 ± 6.8 yrs), 6 had reduced cardiac function, 1 lost to follow-up, and 65 recipients reported adequate transplant function.
Conclusions: This is the largest reported series of pregnancies in heart transplant recipients to date. Live births were reported in 68% of the pregnancies. MPA exposure continues to present significant concerns. Pre-pregnancy counseling should include discussion of the possibility of pregnancy, inheritable cardiac conditions, MPA avoidance, risk of rejection/graft dysfunction, and long-term maternal survival. All centers worldwide are encouraged to have their recipients participate in the TPRI.

Abstract# 143

DSA is Associated with Molecular Changes in Many Hearts with Minor Abnormalities but Not Diagnosed as Antibody-Mediated Rejection

P. Halloran[1], K. S. Madill-Thomsen[1], &. the INTERHEART Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]., ., AB, Canada*

Purpose: We previously developed a microarray-based diagnostic system (MMDx) for heart transplant endomyocardial biopsies, measuring gene expression and interpreting antibody-mediated and T cell-mediated rejection (ABMR, TCMR) using machine-learning classifiers. The present study aimed to determine whether DSA induced mild ABMR-related changes in hearts not diagnosed as rejection.

Methods: The multicenter INTERHEART study NCT02670408 included 1320 biopsies (645 patients) assessed by MMDx; 824 biopsies had DSA measured at time of biopsy. Figure 1 plots biopsies' molecular distribution using Uniform Manifold Approximation and Projection (UMAP) based on rejection-associated transcript scores as inputs, colored by various features.

Results: Using published rules, MMDx subdivided biopsies with No-rejection into Normal, Minor, and Early injury (fig 1A). DSA was associated with ABMR but was positive in many biopsies with No-Rejection (fig 1B).

A "DSAprob" molecular classifier was developed to estimate probability of DSA positivity and detect DSA-related and ABMR-related transcript changes. DSAprob predicted ABMR (AUC 0.90) better than DSA positivity (AUC 0.72) because some DSA does not produce molecular changes. DSAprob was strongly associated with ABMR-related NK cell (e.g. CCL4, KLRD1) or IFNG-inducible (e.g. TAP1, PLA1A) transcripts.

DSAprob detected a gradient of mild molecular changes in biopsies with No rejection, particularly those with Minor changes (fig 1C). DSAprob in No rejection biopsies correlated with DSA positivity.

In Table 1, DSAprob was low in pristine No rejection-Normal biopsies, even if DSA positive, but mildly increased in many No-rejection-Minor biopsies, particularly when DSA-positive (Table 1). DSAprob was also increased in histology No-rejection when they were DSA positive. DSAprob scores were highest in DSA positive biopsies with ABMR but also in TCMR (Table 1).

DSA positive biopsies with No rejection had mildly elevated transcript set scores and classifier scores related to ABMR, but not to TCMR or injury. No rejection biopsies from DSA positive patients had elevated NK and IFNG-inducible transcripts compared to DSA negative patients.

Conclusions: Thus DSA is associated with mild molecular ABMR-related changes in many hearts not currently diagnosed clinically or histologically as ABMR, particularly those with Minor changes. Thus DSA stress on the microcirculation is considerably more widespread than previously appreciated. ClinicalTrials.gov NCT02670408 (heart).

Abstract# 144

Quilty Lesions are Associated with a Tolerance Profile in Heart Allografts Biopsies

J. Torrealba, S. Moore, S. Sathirareuangchai, L. De Las Casas, Q. Cai, *Pathology, UTSW Medical Ctr, Dallas, TX*

Purpose: Previously, in 42 cardiac allograft biopsies, we demonstrated that the presence of Foxp3+ innate and TGF- β + adaptive regulatory lymphocytes in Quilty lesions are associated with higher heart allograft acceptance. In the current study, we aimed to characterize immunomodulatory pathways associated with Quilty lesions by measuring mRNA expression.

Methods: Endomyocardial biopsies of heart allograft from nine patients were included in this study, four with unremarkable endomyocardium (control group) and five with at least one Quilty lesion (Quilty group). No acute T-cell or antibody mediated rejection was present histologically in any of these specimens. Total RNA was extracted from formalin fixed paraffin embedded tissue. Multiplexed mRNA measurement was performed using the nCounter system (NanoString Technologies, Seattle, WA), and data were analyzed with nSolver software (NanoString Technologies, Seattle, WA).

Results: Of 771 gene mRNA levels measured in the NanoString Transplant Immunology Panel, 274 were upregulated in the Quilty group over the control group, with approximately one third related to adaptive immunity and 5% to innate immunity. Higher levels of mRNA expression in the Quilty group were also shown in pathways for hematopoiesis (11%), cytokine (9%), chemokine (7%), cell-extracellular matrix interaction (7%), and apoptosis & cell cycle regulation (5%). More specifically, the mRNA expression of tolerance-associated immunity markers, including FoxP3, TGF-β, and CTLA4, were higher in the Quilty group (2.82, 1.42, and 3.97 fold increase, respectively, with $p < 0.05$). Markers of rejection-associated immunity, including IL-2 and INF-γ, although lower in the quilty group, were not statistically different.

Conclusions: Heart allografts with Quilty lesions have dominant adaptive immunity related mRNA expression with significantly higher mRNA expression of tolerant immunity markers. These data suggest that Quilty lesions, far from passive bystanders, may serve an immunomodulatory role in cardiac allografts. The presence of intra-allograft regulatory T-lymphocyte related signaling in Quilty lesions may help to reduce the risk of rejection and foster allograft acceptance.

Abstract# 145

The Pathology of Heart Allograft Biopsies: Discrepancies in Interpretation Between Conventional Histology and the Molecular Microscope Diagnostic (MMDx®) System

P. Randhawa[1], A. Seitz[2], Y. Huang[1], B. Feingold[2], *[1]Department of Pathology, Pittsburgh, PA, [2]Pediatrics, University of Pittsburgh, Pittsburgh, PA*

Purpose: There is growing interest in using transcriptomics to complement histologic evaluation of allograft hearts. The present study scrutinizes discrepancies between histologic and MMDx® systems and provides a logical framework to understand the underlying reasons.

Methods: Sixty-two allograft biopsies from 22 pediatric HT recipients were clinically graded using the International Society of Heart Transplantation (ISHLT) 2005 criteria. Grade 1R biopsies were further subcategorized into grades 1A, 1B and 2, and grade 2R biopsies into grade 3A and higher, using ISHLT 1990 criteria. Antibody mediated injury was graded as pAMR (0), pAMR (1h+), pAMR (1i+) and pAMR (2). Typically, 2 fragments of tissue from each biopsy were sent for MMDx® analysis by clinical protocol among recipients with clinical concern for rejection (symptoms, new graft dysfunction, increase in DSA, or immediate prior biopsy ≥1B and/or pAMR1h+ or pAMR2-3. Histologic and gene expression findings were correlated and compared with the clinical parameters.

Results: All biopsies without histologic evidence of TCMR and ABMR were also characterized as such by MMDx® (n = 30). MMDx® reported no TCMR in 15/15 biopsies with ISHLT grade 1A and 10/12 grade 1B TCMR (see Table) . The single grade 2 TCMR biopsy in our dataset was interpreted as molecular TCMR. Amongst the 4 biopsies with grade 3A TCMR, 2 were classified as molecular TCMR, one as molecular mixed ABMR/TCMR, and one with neither TCMR nor ABMR. Amongst 36 biopsies with pAMR (0), 8 were classified as molecular ABMR and all patients had concurrent circulating DSA, despite the negative C4d staining. Among biopsies graded pAMR 1h+, 11/18 had molecular findings interpreted as ABMR. MMDx® did not classify ABMR in 5 biopsies (two patients) with pAMR 2 histology, including one with diffuse C4d staining and circulating DSA. However, these biopsies were classified as showing severe injury phenotype.

Conclusions: In this pediatric HTx cohort, MMDx® did not identify TCMR in biopsies with grade 1A, most grade 1B, and occasional grade 2 or 3A rejection. This may reflect lower sensitivity, an arbitrary threshold setting for molecular diagnosis, or misclassification by histologic grading. Detection of ABMR by MMDx® on biopsies graded pAMR0 with circulating DSA highlights the challenges of histology-based diagnosis of ABMR. While these diagnostic discrepancies demonstrate the need for further investigation, they may also suggest that histology and molecular analyses have complementary roles.

Comparison of Histologic and MMDX Diagnoses					
	#	MMDX TCMR	MMDX AMR	Histologic TCMR	Histologic AMR
Grade 1A	15	0	0	15	0
Grade 1B	12	2	0	12	0
Grade 2	1	0	1	1	0
Grade 3A	4	2	1	4	0
pAMR 0	36	1	8	11	0
pAMR 1h+	18	2	11	16	18
pAMR 2	5	0	0	1	5

Abstract# 146

Impact of Statin Intensity on the Incidence of Vascular Events and Graft Survival in Heart Transplant Recipients

E. Kim[1], I. Booth[2], R. Madathil[3], B. Ravichandran[1], M. Demehin[2], M. Plazak[2], *[1]University of Maryland School of Pharmacy, Baltimore, MD, [2]Pharmacy, University of Maryland Medical Center, Baltimore, MD, [3]University of Maryland School of Medicine, Baltimore, MD*

Purpose: Cardiac allograft vasculopathy (CAV) limits long-term graft survival of heart transplant (HT) recipients. In addition to decreased synthesis of cholesterol, statins also demonstrate immunomodulatory effects and slow progression of CAV. Few studies have assessed the effects of statin potency on long-term graft outcomes.

Methods: This single-center, retrospective, cohort study included HT recipients from 2012-2020 who were started on high-intensity statins and compared them to those started on low/moderate-intensity statins within the first six months of HT. The primary endpoint was freedom from a composite of ISHLT CAV1-3, need for percutaneous coronary intervention (PCI), graft loss, or death. Secondary endpoints included each component of the composite endpoint. Cox proportional hazards models were used for primary and secondary outcomes, and event curves were generated using the Kaplan-Meier method. Metabolic parameters were assessed using repeated measures ANOVA.

Results: Of 142 patients included, 47 received high-intensity and 95 received low/moderate-intensity statins within six months of HT. Mean follow-up was longer in the low/moderate-intensity cohort (4.4 ± 2.2 vs. 3.1 ± 1.9 years; p=0.0008). Baseline characteristics were similar between groups, aside from induction therapy and baseline triglycerides (Table 1). Aspirin use was common (97.9% high-intensity vs. 96.8% low/moderate-intensity; p=0.99); Sirolimus conversion was similar between groups (38.3% high-intensity vs. 34.7% low/moderate-intensity; p=0.82). There was no significant difference in the primary outcome (HR, 1.34; 95% CI, 0.80-2.22; p=0.26), even after controlling for induction therapy and pre-transplant hyperlipidemia. There were no significant differences in any of the secondary outcomes. After 12 months of follow-up, low-density lipoprotein marginally increased in the low/moderate-intensity cohort (0.87 ± 43.3 mg/dL high-intensity vs. 12.6 ± 32.1 mg/dL low/moderate-intensity; p=0.22).

Conclusions: This study suggests that early initiation of high-intensity statins provides no benefit in the prevention of long-term adverse vascular and graft outcomes compared to low/moderate-intensity statins. Given their increased propensity for adverse effects (e.g., myalgias), high-intensity statins may better serve HT recipients with refractory post-HT hyperlipidemia.

Abstract# 147

Assessing the Impact of Acute Major Adverse Kidney Events on Clinical Outcomes in Heart Transplant Recipients

J. E. Kelly[1], C. Perez[1], D. Taber[1], R. J. Tedford[2], B. McMahon[2], S. Alzaidi[1], H. B. Meadows[1], *[1]Pharmacy, MUSC Health, Charleston, SC, [2]Medicine, MUSC Health, Charleston, SC*

Purpose: The purpose of this study was to elucidate contributors to the Major Adverse Kidney Events at 30 days (MAKE-30) outcome in heart transplant recipients and the effect on clinical outcomes.

Methods: This was a single-center longitudinal cohort study of heart transplant recipients from 1/1/2015 to 6/30/2020. Patients less than 18 years old were excluded. MAKE-30, a composite of death, doubling serum creatinine, and renal replacement therapy requirements within the first 30 days after transplant was used to assess differences in clinical outcomes for the patient population. The primary outcome was length of stay post-transplant. Secondary outcomes included eGFR at 3 and 6 months, worsening CKD or diagnosis of ESRD at 6 months, length of ICU stay post-transplant, death within one year of transplant, and readmissions within 6 months.

Results: A total of 81 patients were included in the study. Cardiopulmonary bypass (CPB) time and the presence of right ventricular (RV) failure were higher in the patients that met the MAKE-30 criteria. Otherwise, baseline characteristics were similar between groups (Table 1). In the univariate analysis, length of stay post-transplant was significantly shorter in the patients that did not meet the MAKE-30 criteria (13.6±8.8 vs. 25.8±28.5 days; p=0.014). There was a trend towards less readmissions at 6 months with the non-MAKE-30 group (45.5% vs. 66.7%; p=0.057). eGFR was significantly better in the non-MAKE-30 population at 3 (p=0.002) and 6 months (p=0.029; Table 2). In the multivariable regression analysis, pre-transplant LVADs and the presence of RV failure were associated with a significantly increased risk of meeting the MAKE-30 outcome after controlling for CPB time, UF requirements, time to initiation of calcineurin inhibitors, dose of vancomycin, and inotropic and vasoactive-inotropic score. Less UF requirements offered protection against meeting MAKE-30, although it was not statistically significant (Table 3).

Conclusions: Length of stay was significantly shorter in patients that did not meet the MAKE-30 criteria in this study, and these patients had significantly better long-term renal function at 3 and 6 months. As shown in the multivariate analysis, having

an LVAD prior to transplant and the presence of RV failure put patients at a higher risk of meeting this outcome. As this was a small retrospective study, subsequent studies are warranted to validate these findings.

Abstract# 148

Acute Kidney Injury Requiring Dialysis in Heart Transplant Recipients is a Risk Factor for Graft Failure and Overall Mortality

M. A. Merzkani, H. Murad, A. Pottebaum, A. Java, A. Malone, J. Schilling, A. Itoh, R. Delos Santos, T. Alhamad, *Transplant, Washington University, Saint Louis, MO*

Purpose: Acute Kidney Injury (AKI) is a frequent complication of heart transplantation. However, with recent allocation changes, we have increasingly complex patients with a higher incidence of AKI requiring renal replacement therapy. In this study, we evaluate the impact of AKI requiring dialysis on heart graft survival and overall mortality.

Methods: We identified adult patients (≥ 18 years old) with a solitary heart transplant between 1/1/2000 and 9/04/2020 from the Organ Procurement Transplantation Network data. We excluded patients who were on hemodialysis prior to heart transplant. Multivariate Cox regression analysis was performed and adjusted for age, sex, Body Mass Index, length of stay, ischemic time, serum creatinine prior to transplant, previous heart transplant and rejection in the first year.

Results: A total of 40910 solitary heart transplant recipients were identified. Of these, there were 3927 (9.6%) that required dialysis after transplantation. Our cohort's mean age was 52.69 ±12.69 years, with a predominance of males (74.31%) and Caucasians (68.87%). Compared to patients without the need for dialysis, patients that developed AKI requiring dialysis had a significantly higher risk of graft failure [adjusted hazard ration (aHR 1.31 95% CI 1.095-1.57)] and patient death (aHR1.28 95% CI (1.17-1.40) over 5.82 ± 5.03 years of follow up

Conclusions: There was a significant association between AKI requiring dialysis and the risk of overall mortality and heart graft failure. Large, prospective studies will be needed to identify how to prevent severe AKI in these patients in order to improve heart graft and patient survival.

Table 1. Baseline characteristics

Clinical Characteristics	f(%) or mean ±SD
Sex recipient (Male)	30302 (74.31%)
Age (years)	52.69 ± 12.69
BMI (kg/m2)	27.14 ± 4.88
Caucasians	28171(68.87%)
Age of the donor (years)	31.85 ± 13.68
Sex donor(Male)	26970 (70.44%)
Time (min) censored (years)	5.82±5.03
Ischemic time (hours)	3.19 ± 1.05
CVD	3276 (8.32%)
Serum Creatinine baseline (mg/dl)	1.24 ± 0.60
Length of stay (days)	20.33 ±
Previous transplant	995 (2.44%)
Rejection the first year	7907 (19.32%)

Abstract# 149

Acute Dialysis, Mortality and Renal Failure After Heart Alone Transplant by Egfr and Dialysis Requirement in the United States

M. Aljuhani[1], T. Alexy[1], S. Jackson[2], C. Martin[1], R. Kandaswamy[3], S. Riad[1], *[1]Medicine, University of Minnesota, Minneapolis, MN, [2]Complex Care Analytics, Fairview Health Services, Minneapolis, MN, [3]Surgery, University of Minnesota, Minneapolis, MN*

Purpose: We examined the early acute dialysis, 90-day mortality and one-year ESRD among OHT recipients by eGFR and dialysis requirement before transplantation.

Methods: Utilizing the SRTR file, we identified all adult primary heart transplant recipients with eGFR less than 30 mL/min between 2000 and 2018. Recipients were categorized into 2 groups based on eGFR < 15 mL/min (n=127) and between 15-30 mL/min (n=901). Pre-transplant variables and post-transplant outcomes not subject to censoring were compared between the study groups using chi-square or Wilcoxon tests. For multivariable analysis, the outcomes of acute dialysis, 90-day mortality and one-year ESRD were analyzed using a generalized linear mixed model with transplant center as a random effect. Models were adjusted for age, gender, transplant indication, pre-transplant dialysis, last waitlist status and time on the waiting list.

Results: Acute dialysis post-transplant was more frequently observed in recipients with eGFR < 15 mL/min as compared to recipients with eGFR> 15 mL/min (54% vs. 32.7%, p<0.001). 90-day mortality was observed in 24.9 % of the lower eGFR group and 18.2% of the other group. Overall, the cumulative risk of mortality was higher in the lower eGFR group (Figure 1). The prevalence of renal failure among the surviving recipients was higher in recipients with eGFR< 15 mL/min as compared to those with > 15 -30 mL/min (29.3 % vs. 10.2%, p < 0.001). In the multivariable model, dialysis requirement before heart transplant alone was a strong predictor of acute dialysis, 90-day mortality and 1-year ESRD. Compared to recipients with eGFR< 15 mL/min, those with eGFR > 15-30 mL/min had lower risks of needing acute dialysis and 1-year ESRD. Recipients with congenital heart disease had a 2.6-fold increased risk of 90-day mortality than recipients with non-ischemic transplant indications.

Conclusions: Owing to the high mortality of 35% at one year, heart transplant alone does not appear to be a viable option for those with low eGFR (<15 mL/min) or requiring dialysis. In comparison, the 15-30 mL/min group had lower mortality, approaching that of the Heart-Kidney transplant, and of those who survived, the majority 90% remained free of dialysis at one year. Perhaps, heart transplant alone with a safety net (either with advanced LD or DD) should be considered in this group. Our results are limited by the lack of data on renal failure acuity, which will need to be addressed in the future.

Table 1: Post-Transplant Acute Dialysis, 90-Day Mortality and 1-year ESRD

	0-15 mL/min	>15-30 mL/min	p-value
Recipient Cardiac Output L/min	4.77 [3.30, 6.05]	4.60 [3.60, 5.70]	0.846
Post-Transplant Acute Dialysis	***67 (54.0)***	***288 (32.7)***	***<0.001***
90-Day Mortality	31 (24.4)	164 (18.2)	0.120
1-Year Mortality	***44 (34.6)***	***228 (25.3)***	***0.033***
1-Year ESRD	***24 (29.3)***	***68 (10.4)***	***<0.001***

The Metabolism Milleu: Updates in Pharmacokinetics and Pharmacogenomics

Abstract# 150

Economic and Clinical Benefit of Cmv Matching in Kidney Transplantation

D. Axelrod[1], S. Chang[2], A. Olyaei[3], D. Malinoski[3], D. Norman[3], K. Lentine[4], M. Schnitzler[4], D. Segev[5], J. Lockridge[3], *[1]Univ of Iowa, Iowa City, IA, [2]Washington Univ, Seattle, WA, [3]Oregon Health Sciences Univ, Portland, OR, [4]Saint Louis Univ, Saint Louis, MO, [5]Johns Hopkins, Baltimore, MD*

Purpose: Recently, kidney transplant (KTx) centers in Oregon collaborated to preferentially allocate cytomegalovirus-seronegative (CMV D-) kidneys to seronegative recipients (CMV R-), successfully reducing high-risk CMV D+/R- KTx by 84%. CMV R- recipients waited 5.5 months longer for KTx than those who were CMV D+. This protocol was evaluated using a decision analysis with a lifetime horizon to assess the potential clinical and economic benefits of a national policy change to reduce CMV mismatch transplant.

Methods: A Markov model was used to compare the cost and outcome of D+/R- transplant with D-/R- transplant, including 5.5 months of additional waiting time. Economic inputs included Medicare part A and B payments for dialysis-dependent waitlist patients through post-transplant. Prophylaxis cost was determined using average wholesale price for 6 months of valganciclovir with PCR monitoring (D+/R-) and 1 month valacylovir (D-/R-). Utility estimates for dialysis, KTx, and post-KTx were used to calculate quality-adjusted life years (QALYs) from UNOS graft and patient survival data, including a 3% annual discount rate. Results were applied to 2018 deceased donor KTx results.

Results: The estimated cost of KTx and lifetime post-transplant care differed significantly by donor status (D+R- $542,963 vs. D-R- $516,867 per person, P <.0001), including the cost of 5.5 months of additional waiting time. Similarly, D-R- KTx was associated with a quality-adjusted lifetime survival (D-R-: 11.7 QALYs vs. D+/R- 10.4 QALYS). These results were robust, with waiting times as long as 30 months (Figure). In 2018, 2699 D+/R- deceased KTx were performed. Reallocating D- organs from R+ to R- KTx could have saved $70,433,104 and increased survival by 3,378 QALYs.

Conclusions: A shift to a national strategy of CMV donor and recipient matching would result in decreased cost and improved survival for CMV-seronegative recipients, despite slightly longer waiting times. Because D+ could be reallocated to R+ recipients, transplant access should not be adversely affected. The allocation system could be adjusted to allow for CMV mismatch exceptions in difficult-to-match patients (eg, high PRA).

Abstract# 151

Belatacept Pharmacokinetic Analysis Comparing Belatacept Early Steroid Withdrawal Trial (BEST) with Benefit and Benefit-ext Trials

A. Bickenbach[1], M. McGowan[1], B. Miyagawa[2], T. Mizuno[2], A. Shields[3], A. Christianson[1], P. West-Thielke[4], J. Leone[5], E. Woodle[1], D. Kaufman[6], A. Wiseman[7], A. Matas[8], A. Vinks[2], *[1]U Cincinnati, Cincinnati, OH, [2]Cincinnati Childrens Med Center, Cincinnati, OH, [3]Christ Hospital, Cincinnati, OH, [4]UIC, Chicago, IL, [5]Tampa Gen, Tampa, FL, [6]U Wisconsin, Madison, WI, [7]Centura Transplant, Denver, CO, [8]U Minnesota, Minneapolis, MN*

Purpose: Belatacept(BELA) pharmacokinetic(PK) studies informed dosing in phase 3 studies where fixed mg/kg dosing compared a less intense(LI) and more intense(MI) regimen. LI was preferred over MI due to better risk/benefit profile. We compared PK parameters observed in the BELA Early Steroid withdrawal Trial (BEST) with previous reports.

Methods: Samples analyzed BELA troughs via a validated quantitative enzyme-linked immunoassay. Clearance(Cl) was estimated with Bayesian estimation using clinical software MWPharm++(Mediware). Published population PK model was employed as the Bayesian prior. Allometric scaling adjusted for body weight. Individual concentration profiles generated estimated exposure parameters; troughs, area under the curve(AUC), average concentration(Cave), cumulative AUC(cAUC), and cumulative average(cCave). PK parameters were analyzed by age ≥60, race, gender, BMI ≥30, rejection and infection.

Results: 876 BELA troughs in 191pts were analyzed. Bayesian predicted concentrations agreed with observed concentrations(R^2=0.88)**.** Figure 1 illustrates the model-based BELA concentration profiles with observations. Exposure was higher compared to previous reports (Figure 2) especially during induction phase. There were no differences in PK parameters observed based upon alemtuzumab vs r-ATG induction. The allometrically standardized Cl was comparable (0.74 vs 0.86L/day/70kg) and inter-individual variability in Cl was low (CV=22% vs 21%) in BEST and Zhou et al. Positive correlation between body weight and Cl(Figure 3) and Cavg was consistent across body weights. Significantly higher Cl was observed for patients <60 and AA. No differences in allometrically scaled Cl was observed by BMI or sex. Exposure was greater when BMI≥30 and male. There were no differences in exposure in rejecting pts, however, pts with any infection, viral, and BK had significantly higher exposure.

Conclusions: BELA PK was no different between alemtuzumab and r-ATG, but was higher than observed in trials using basiliximab and steroids. Reducing BELA exposure during the induction phase by reduced mg/kg doses or other anthropometric measures may be warranted. BELA concentration controlled trials may be considered to further optimize dosing.

Abstract# 152

Cyp3a5 Extensive Metabolizer Phenotype May be Associated with an Increase in Class 2 Donor Specific Antibodies and Antibody-Mediated Rejection

S. Mirza[1], N. Wilson[2], J. Van Zyl[2], P. Nguyen[2], T. Sam[2], S. Hall[2], M. Askar[2], R. Patel[2], *[1]Texas Tech Univeristy Health Sciences Center Jerry H. Hodge School of Pharmacy, Dallas, TX, [2]Baylor University Medical Center at Dallas, Dallas, TX*

Purpose: Tacrolimus (TAC) metabolism is highly dependent on CYP3A5, yet there is limited data on the effect of CYP3A5 genetic polymorphisms in heart transplant recipients (HT). The purpose of this study is to identify associations between CYP3A5 phenotypes and weight-normalized TAC dose at therapeutic level (TL), time to TL, time to stable TL, donor specific antibodies (DSA) development, and rejection.

Methods: We conducted a retrospective, single center review of HT transplanted 12/2018 to 08/2020. Patients were excluded if they were started on extended-release TAC, received combined organ transplant, or discharged on medications that significantly interact with TAC. TL was defined as 8-15 ng/mL and stable TL as 3 consecutive TLs. Patients were grouped by non-CYP3A5*1 carriers (poor metabolizers, PM), *1 heterozygous (intermediate metabolizers, IM), and *1 homozygous (extensive metabolizers, EM). If the patient was on sublingual TAC, the dose was reported as two-fold. All patients were on fluconazole 100 mg daily. Overall differences between metabolizer groups were assessed using Kruskal Wallis and Jonckheere Trend tests if continuous, and Chi-Square, Fisher Exact, or Cochran-Armitage Trend tests if categorical. Two group comparisons were made with Wilcoxon Rank Sum, Chi-Square, or Fisher Exact tests.

Results: Of 66 HT analyzed, 41 were CYP3A5 PM, 21 IM, and 4 EM. First therapeutic TAC doses were significantly higher in the EM and IM compared to the PM (Fig. 1A). The stable therapeutic TAC dose was significantly lower in the PM group when compared to the IM and EM (Fig. 1B). Time to TLs were similar in all groups, however a trend towards longer time to stable TL in EM was observed (Fig. 1C). Additionally, there was a trend for a higher rate of Class 2 DSA (DSA-C2) and AMR in EM (Fig. 1D).

Conclusions: We observed higher incidence of DSA-C2 and AMR in the EM group that might be related to prolonged time to stable TL. Thus, CYP3A5 phenotype testing may help identify HT who would benefit from increased DSA monitoring. These data warrant further exploration in larger cohorts.

Abstract# 153

Evaluate the Effect of Cresemba (isavuconazonium Sulfate) Capsule and Noxafil (posaconazole) Delayed Release Tablets on Tacrolimus Dose to Concentration (D/C) Ratios in Lung Transplant Recipients

H. Sweiss[1], E. Kincaide[1], D. Levine[2], R. Hall[1], *[1]University Health, San Antonio, Department of Pharmacotherapy and Pharmacy Services, The University of Texas at Austin, Pharmacotherapy Division, College of Pharmacy, San Antonio, TX, [2]University Health, San Antonio, University of Texas Health Science Center at San Antonio, San Antonio, TX*

Purpose: Evaluate the effect of Cresemba (isavuconazonium sulfate) capsule and Noxafil (posaconazole) delayed release tablet on tacrolimus dose to concentration (D/C) ratio in lung transplant.

Methods: This retrospective review included adult lung transplant recipients at University Transplant Center from 1/1/2017-10/1/2020. Patients received concomitant therapy of immediate-release tacrolimus with one of the following triazoles for antifungal prophylaxis or treatment of invasive fungal disease for a minimum of 7 days: posaconazole (PSZ) delayed release (DR) tablet or isavuconazonium sulfate (ISV) capsule. A matched pair analysis compared the following outcomes pre-triazole initiation and 7-30 days post-triazole initiation: tacrolimus trough (mg/dL), total daily dose of tacrolimus (mg), total weight-based total daily dose of tacrolimus (mg/kg), and tacrolimus D/C ratio. In addition, percentage change in tacrolimus D/C ratio was calculated pre- and post-triazole initiation.

Results: Fifty lung transplant recipients were screened for inclusion in the study, with 41 patients meeting study criteria. A total of 34/41 patients received PSZ DR

tablets (Table 1). Of these patients, 22/34 were transitioned from previous triazole therapy to PSZ DR tablets and experienced a 47% reduction in tacrolimus D/C ratio after conversion to PSZ DR tablets. Twelve patients were newly initiated (de novo initiation) on PSZ DR tablets and experienced a 50% reduction in tacrolimus D/C ratio post-triazole initiation. A 35% reduction in tacrolimus D/C ratio was observed when transitioning to ISV from previous triazole therapy (P=0.69) (Table 2).

Conclusions: This data suggests when initiating patients on PSZ DR tablets or converting from a previous triazole, a tacrolimus dose reduction of approximately 50% is required. Although there was not statistical significance, switching from a previous triazole to ISV may require less of a tacrolimus dose reduction. More patients would need to be gathered to see if this holds true. Limited evidence exists to navigate tacrolimus dose adjustments with de novo initiation and converting between triazole antifungals. This study provides guidance on management of tacrolimus dosing when initiating newer triazole antifungal agents.

Table 1. Effects of posaconazole delayed release tablets on concomitant therapy with tacrolimus (N=34)

Outcome (Median, IQR)	De Novo PSZ DR start (N=12)			Switch to PSZ DR from prior triazole (N=22)

Abstract# 154

ABCC2 Haplotypes Associations to Mycophenolic Acid Pharmacokinetics in Stable Renal Transplant Recipients

K. Tornatore[1], D. Brazeau[2], C. Meaney[3], J. Consiglio[4], A. Gundroo[5], S. Chang[6], G. Wilding[4], L. Cooper[3], *[1]Pharmacy Practice, School of Pharmacy; University at Buffalo- SUNY, Buffalo, NY, [2]Pharmacy Practice, Marshall University, Huntington, WV, [3]Pharmacy Practice, School of Pharmacy; University at Buffalo, Buffalo, NY, [4]Biostatistics, School of Public Health; University at Buffalo, Buffalo, NY, [5]Medicine, School of Medicine; Ohio State University, Columbus, OH, [6]Medicine, School of Medicine; University at Buffalo, Buffalo, NY*

Purpose: Mycophenolic acid (MPA), exhibits interpatient pharmacokinetic (PK) variability attributed to enterohepatic circulation of the glucuronide metabolite (MPAG) to MPA. This is mediated by multidrug resistance-associated protein 2(MRP2), which is encoded by *ABCC2.* MPAG conversion contributes to MPA PK variability and may be impacted by calcineurin inhibitors or transporter polymorphisms. This study investigated *ABCC2* haplotypic associations to MPA pharmacokinetics in stable renal transplant recipients receiving calcineurin inhibiters.

Methods: Pharmacogenomic analysis of prospective, cross-sectional studies evaluated 147 stable recipients receiving tacrolimus(TAC) and MPA or cyclosporine (CYA) and MPA. MPA pharmacokinetics included trough 12hr, Area Under the Concentration-Time curve 0-12 hours (AUC 0-12hr),and clearance (CL). The MPA therapeutic target exposure (AUC 0-12hr) was 30 to 60 mg•hr/L. The *ABCC2* genotypes: *ABCC2* 1249 C>T(rs2273697); *ABCC2* -24C.T (rs717620) and *ABCC2* 3972 C>T (rs3740066) were determined. Haplotype phenotypic associations were computed using THESIAS(v. 3.1) based upon the Combined Treatment groups (TAC-MPA plus CYA-MPA) with a sub-analysis based upon individual calcineurin inhibitor regimens.

Results: For the Combined Treatment analysis, 51% of all participants exhibited the wild-type (WT) haplotype, CGC, and had slower MPA CL with greater AUC 0-12hr that was in the target range compared to the 18% of recipients with the variant haplotype, CGT who achieved sub-therapeutic exposure. Similar findings are reported for the Tacrolimus-MPA regimen. No differences were found between the WT and variant haplotype with the Cyclosporine-MPA regimen. See Table below which summarizes significant results of Combined and Tacrolimus-MPA Treatment groups.

Conclusions: The variant *ABCC2* haplotype, CGT, contributes to sub-therapeutic MPA exposures and influences interpatient variability in pharmacokinetic phenotypes when compared with the WT, CGC in the Combined Treatment groups and Tacrolimus-MPA regimens.

ABCC2 Haplotype Associations to MPA Pharmacokinetic Phenotypes

		Combined Treatment N=147 (% Partici-pants)			TAC-MPA N=67 (% Partici-pants)	
MPA PK Mean (±95% Confidence Interval)	WT CGC (51%)	Variant CGT (18%)	P Value	WT CGC (52%)	Variant CGT (22%)	P Value
Trough C12hr (mg/L)	1.63 (1.39-1.87)	1.01 (0.42-1.61)	0.078	2.25 (1.87-2.63)	1.33 (0.411-2.25)	0.081
AUC 0-12hr (mg•hr/L)	31.06 (27.83-34.30)	18.03 (8.40 -27.66)	0.018	39.96 (34.59-45.32)	20.06 (4.08 -36.0)	0.031

Abstract# 155

Impact of Cypa5 Status on the Clinical and Financial Outcomes of Kidney Transplant

J. Obayemi[1], B. Keating[2], K. Lentine[3], M. Schnitzler[3], H. Xiao[3], V. Dharnidharka[4], D. Axelrod[5], *[1]Univ of Michigan, Ann Arbor, MI, [2]Univ of Pennsylvania, Philadelphia, PA, [3]Saint Louis Univ, Saint Louis, MO, [4]Washington Univ, Seattle, WA, [5]Univ of Iowa, Iowa City, IA*

Purpose: Pharmacogenetic profiling of transplant recipients has demonstrated marked variation in the metabolism of immunosuppressive medications, particularly tacrolimus. Patients of African ancestry have been found to express loss-of-function mutations in the CYP3A5 gene less often than patients of other racial backgrounds, resulting in rapid metabolism of tacrolimus. Patients with this rapid metabolism require higher dosing to achieve adequate trough levels and are exposed to a greater risk of toxicity from elevated peak levels.

Methods: The CYPA5 mutation status (*3,*6, or *7) of 286 adult AA kidney transplant (KTx) recipients (96%) was determined retrospectively using gene-wide analysis and categorized as 0 mutations (rapid metabolizers), 1 mutation (intermediate metabolizers), and 2 mutations (slow metabolizers). KTx outcomes (patient survival, kidney survival, and total Medicare spending) were determined using linked transplant registry and transplant claims data.

Results: Among the cohort, 23% were rapid, 47% were intermediate, and 30% were slow metabolizers of tacrolimus. At 3 years, the rate of death-censored graft failure and all-cause graft failure was highest in the rapid metabolizers and lowest in the intermediate metabolizers (Figure). First-year Medicare reimbursement differed significantly (rapid, $79,535; intermediate, $72,796, and slow, $79,346, *P*=0.02). After adjustment for donor and recipient characteristics, intermediate metabolizers were $4400 less expensive than rapid metabolizers (*P*=.007).

Conclusions: Pharmacogenomic assessment of AA KTx recipients may be useful to guide therapy, because CYPA5 status appears to be associated with outcome and spending after transplant.

Abstract# 156

Pharmacokinetic Analysis of Direct Acting Antiviral Use on Weight-Adjusted FK506 Trough/dose Ratios in Obese Kidney Transplant Recipients

A. Demirag[1], P. L. Lobo[2], J. Oberholzer[1], A. Kumar[2], B. Rawashdeh[1], S. L. Lennon[1], H. N. Guvener Demirag[1], A. Doyle[2], J. Geystone[3], K. L. Brayman[1], *[1]Transplantation, University of Virginia Medical Center, Charlottesville, VA, [2]Transplantation Nephrology, University of Virginia Medical Center, Charlottesville, VA, [3]Clinical Pharmacy, University of Virginia Medical Center, Charlottesville, VA*

Purpose: Using hepatitis C viremic (HCV) organs in kidney transplant recipients(KTRs) is very important to decrease the number of patients on the waiting list. Direct acting antivirals (DAA) are highly effective at curing HCV infection, but the pharmacokinetic implications of DAA use on calcineurin inhibitor therapy in KTRs are incompletely described. The aim of this study is to investigate the effects of DAA on FK506(FK) trough/dose (T/D) ratio and rejection rate in KTRs.

Methods: This is a single-center, retrospective analysis of HCV negative KTRs who received HCV kidneys followed by 12-weeks of DAA therapy. Immunosuppression(IS) was administered based on our transplant center protocol: prednisone, FK and mycophenolate. Dose of FK was adjusted to keep FK levels at desired levels based on our IS protocol. FK T/D ratio was determined while patients were on a stable dose of FK to maintain the desired steady-state T level prior to, during, and after DAA treatment. FK T levels were quantitated twice per week and a steady state was determined when the desired level was attained at three consecutive measurements.

Results: Fourty-four HCV negative organ recipients received HCV positive deceased donor kidney allografts between 3-2019 and 6-2020. Median age was 57 years (IQR 50-66). The FK T/D ratio was greater during DAA treatment (5.54, IQR 2.79-7.65) compared to before treatment (1.85, IQR 1.12-2.67) (p<0.01), after completion of treatment (2.25, IQR 1.41-2.89) (p<0.01). Six KTRs developed cellular acute rejection (ACR) post DAA treatment within the first 6 months post-transplant(p<0.01).

Conclusions: DAA treatment in kidney transplant recipients decreases FK elimination leading to a decrease, by about 40% in FK dosing during DAA therapy. Cessation of DAA therapy leads to an increase in ACR possibly because of delays in increasing the FK dose. Larger studies are warranted to validate these findings.

Abstract# 157

De-novo Use Comparison Between Extended-release Once-daily Tacrolimus (Envarsus Xr®) and Immediate-release Twice-daily Tacrolimus (Prograf®) - A Single Center's Experience

N. Singh[1], T. Le[1], M. S. Naseer[1], S. Asmil[1], A. Palermini[1], A. Qamar[1], R. Chand[1], S. Tandukar[1], D. Aultman[2], H. Shokouh-Amiri[2], G. Zibari[2], *[1]Transplant, John C. McDonald Regional Transplant Center - Willis Knighton Medical Center, Shreveport, LA, [2]Advanced Surgery, John C. McDonald Regional Transplant Center - Willis Knighton Medical Center, Shreveport, LA*

Purpose: Envarsus XR® is approved for de-novo use post-kidney transplantation at a higher starting dose (0.14mg/kg/day) as compared with Prograf® (0.1 mg/kg/day) despite better bioavailability. The goal of this study was to compare the initial dosing and pharmacokinetic profile of these two formulations at our center early post-transplantation.

Methods: We evaluated 106 Envarsus XR® patients (Aug 2016 to Jun 2020) and 109 Prograf® patients (Jun 2008 to Nov 2016). We compared the two formulations for patient demographics, initial dose, therapeutic dose, maintenance dose, and time taken for drug level to become detectable and therapeutic.

Results: Compared with Prograf®, Envarsus XR® patients received a higher initial starting dose (0.09 ± 0.03 vs. 0.06 ± 0.03 mg/kg/day, $p < 0.01$), but required lower doses to reach target level ≥ 6 ng/ml (0.12 ± 0.05 vs. 0.16 ± 0.06 mg/kg/day, $p < 0.01$) and target level ≥ 10 ng/ml (0.14 ± 0.06 vs. 0.17 ± 0.07 mg/kg/day, $p < 0.01$). Time taken for drug level to first become detectable and achieve therapeutic levels were also significantly lower in Envarsus XR® patients (Table 1). The rejection episodes, graft survival, patient survival, delayed function, and adverse events is currently being compared between the two groups.

Table 1: Results

	Envarsus (n=106)	Prograf (n=109)	P-Value
Time (d) for drug level to be first detectable, mean ± SD	2.77 ± 1.60	4.45 ± 2.12	<0.01
Time (d) to reach drug level ≥6 ng/ml, mean ± SD	4.12 ± 2.37	7.12 ± 4.82	<0.01
Time (d) to reach drug level ≥10 ng/ml, mean ± SD	6.67 ± 6.23	12.00 ± 8.72	<0.01
Initial starting dose (mg/kg), mean ± SD	0.09 ± 0.03	0.06 ± 0.03	<0.01
Therapeutic dose (mg/kg) for target level ≥6 ng/ml, mean ± SD	0.12 ± 0.05	0.16 ± 0.06	<0.01
Therapeutic dose (mg/kg) for target level ≥10 ng/ml, mean ± SD	0.14 ± 0.06	0.17 ± 0.07	<0.01
Maintenance dose (mg/kg) at Day-30, mean ± SD	0.13 ± 0.08	0.16 ± 0.07	>0.05

Conclusions: Envarsus XR® provides the advantage of reaching a therapeutic level earlier with a lower dose as compared with Prograf®.

Infections in Kidney Recipients

Abstract# 158

Posttransplant Malignancy in HIV+ Kidney Transplant Recipients

D. Sawinski[1], R. Fitzsimmons[1], J. Locke[2], J. Trofe-Clark[1], B. Shelton[2], P. Reese[1], E. Blumberg[1], *[1]Hospital of the University of Pennsylvania, Philadelphia, PA, [2]University of Alabama at Birmingham, Birmingham, AL*

Purpose: Kidney transplant recipients and people living with HIV are both at increased risk for malignancy, including cancers that are virally-mediated. Despite the recognition of malignancy as an important contributor to mortality in both populations, the impact of HIV and kidney transplantation together on post-transplant cancer rates has not been systematically studied.

Methods: We linked data from the OPTN/UNOS and USRDS to assemble a cohort of first kidney transplant recipients from 1/1/01-12/31/16 who had Medicare Part A and B claims. Using ICD-9 codes, we identified cancer outcomes via validated cancer claims from Medicare data. We used Poisson and negative binomial regression to estimate post-transplant malignancy adjusted incidence rate ratios (aIRR), by HIV and HCV sersostatus. HIV+ and HIV+/HCV+ patients were combined for analysis to improve power. Cancers were considered both individually and in groups: epithelial (breast, prostate, colon, ovary, trachea/bronchus, lung); HPV-related, tobacco-related, and infection-related.

Results: We identified 135,702 HIV-/HCV-, 6781 HCV+, 815 HIV+ and 203 HIV+/HCV+ recipients who met study criteria. 25.3% of the cohort overall had a post-transplant cancer-related Medicare claim and the median time to a cancer claim was 4.9 (1.9-8.9) years after transplant. HIV+ recipients had elevated rates of epithelial (aIRR 1.41, 95% CI 1.10-1.81), HPV (aIRR 4.03, 95% CI 2.59-6.26) and tobacco-related cancers compared to HIV-/HCV- or HCV+ recipients. Infection-related cancers were increased in both HIV+ and HCV+ recipients. Among cancers most prevalent in the general population, HIV+ recipients had elevated rates of lung and colon cancers, as well as melanoma and Non-Hodgkin's lymphoma (Table1).

Conclusions: HIV+ kidney transplant recipients experience rates of many cancers that are elevated beyond rates expected due to transplant alone. Post-transplant screening efforts in HIV+ recipients should focus on lung, colon and skin cancer screenings in addition to HPV-related malignancy surveillance.

Table 1. Adjusted incidence rate ratios among HIV+ and HCV+ kidney transplant recipients for the most common cancer types observed in the general population

Abstract# 159

Influence of Induction Therapy and Antiretroviral Regimen on Outcomes in HIV Positive Renal Transplant Recipients

C. Rogers Marks[1], C. Durand[2], J. Hand[3], M. Abidi[4], M. Malinis[5], B. Barnaba[2], H. Patel[6], C. D. Alonso[6], *[1]Massachussetts General Hospital, Boston, MA, [2]Johns Hopkins Medical Center, Baltimore, MD, [3]Ochsner Medical Center, New Orleans, LA, [4]Univ. of Colorado, Aurora, CO, [5]Yale, New Haven, CT, [6]Beth Israel Deaconess Medical Center, Boston, MA*

Purpose: Transplantation of HIV+ individuals has become more common over the past decade with increasing data supporting good outcomes. Questions remain regarding the impact of induction and antiretroviral (ARV) choice on long-term outcomes.

Methods: We performed a multicenter retrospective analysis of outcomes in HIV+ kidney transplant (KT) recipients from 2004-2019. Recipients of HIV + donors and kidneys with primary non-function were excluded. Outcomes included rejection, graft and patient survival stratified by induction immunosuppression and ARV regimen.

Results: There were 78 KT in 77 patients at 5 US transplant centers. Clinical characteristics and outcomes are shown in Table 1. Rejection at any time occurred in 38% (30/78 KT). Those with rejection were more likely to be younger, African American, and to have received a deceased donor kidney (all p<0.05). Among 78 the transplants, 29 were on a protease inhibitor (PI) at KT; 11 of 29 (37%) switched to non-PI-based ARVs. This occurred more frequently after 2009 (58.8%) compared to before 2009 (8.3%). The lowest rates of rejection and highest graft survival were seen in recipients who received Anti-thymocyte globulin (rabbit) (rATG) induction and were on non-PI-based ARVs as illustrated in Figure 1a and Figure 1b. Among those receiving rATG, there was a trend to higher rejection and graft loss in those on PI-based ARV (p=0.07). There were no differences in death-censored graft loss or patient survival.

Conclusions: Our results align with previous studies showing a benefit of rATG and non-PI-based ARVs on KT outcomes. Results from this study may influence selection of ARV regimens and induction therapy in HIV+ kidney transplant recipients.

Abstract# 160

Outcomes of Kidney Transplantation in HIV Positive Highly Sensitized Recipients

S. Karhadkar, J. Panichella, H. Resweber, K. Nguyen, A. Di Carlo, S. Karhadkar, *Temple University School of Medicine, Philadelphia, PA*

Purpose: Since the introduction of highly active antiretroviral therapy, HIV+ individuals are living longer, which has led to higher rates of end stage renal disease and kidney transplantation has become of increasing interest in this demographic. Renal allograft survival in HIV+ patients has lagged behind that of comparable cohorts and has been associated with increased rates of acute rejection. Additionally, increased rates of positive cross-matches in these recipients has impacted organ utilization. This study focuses on outcomes of kidney transplantation in HIV+ patients who are highly sensitized as described by a PRA value 90%-100% and/or with a positive cross match.

Methods: Data was gathered from the 2018 UNOS database, in which a total of 1530 HIV+ patients who received kidney transplants were selected. PRA values were grouped to create sensitization levels: non-sensitized (0%), low (1%-50%), medium (51%-89%), and highly sensitized (90%-100%). A demographics table was created to compare characteristics and outcomes between the four sensitization groups. A separate demographics table was created for non-sensitized and highly sensitized groups who also had a positive cross match. Subject characteristics were summarized using means and standard deviations or frequencies and percentages, as applicable. Significance between groups was determined by independent samples t-tests and χ^2 tests ($\alpha = 0.05$.). Death-censored graft survival for various subgroups was estimated using Kaplan-Meier with Log-Rank to assess significance. All analysis was completed using SPSS Statistics 26.

Results: The median graft survival for all 1530 patients is 792 days. The median graft survival for the non-sensitized group is 738 days while the median graft survival for the highly sensitized group is 990 days. The corresponding Kaplan-Meier graph displays no significant difference in the survival curves of the four groups; furthermore the highly sensitized group is the highest curve. The median graft survival for the non-sensitized group with a positive cross match is 2031 days while the median graft survival for the highly sensitized group with a positive cross match is 1606.5 days. The corresponding Kaplan-Meier graph displays that the survival curve of the highly sensitized group is slightly less than that of the non-sensitized group.

Conclusions: Graft survival is comparable for the highly sensitized compared to the non-sensitized group.HIV+ patients with a PRA value >= 90% should not be excluded from transplantation nor considered at higher risk when compared to non-sensitized patients. The highly sensitized HIV+ patients with a positive cross match did exhibit a lower median graft survival, however, when comparing both the non-sensitized and highly sensitized to the overall study population, both groups had significantly higher median graft survival.

Abstract# 161

Infectious Complications After Belatacept Conversion in Kidney Transplant

J. E. Marvin[1], D. Amenyedor[1], M. M. Azar[2], K. Belfield[1], V. Do[1], R. Formica[3], E. Cohen[1], *[1]Pharmacy, Yale New Haven Hospital, New Haven, CT, [2]Section of Infectious Diseases, Yale School of Medicine, New Haven, CT, [3]Section of Nephrology, Yale School of Medicine, New Haven, CT*

Purpose: Tacrolimus (tac), a calcineurin inhibitor, is associated with multiple adverse effects when used for immunosuppression following kidney transplant (KT). Belatacept (bela) is a monoclonal antibody that blocks the co-stimulatory T-cell activation pathway that has been shown to be effective with a favorable side effect profile. However, studies assessing long-term infectious complications with bela compared to tac are limited. The purpose of this study was to determine the incidence of infections in patients converted to bela compared to those maintained on tac.

Methods: In this retrospective study, KT recipients receiving bela between 2012 and 2020 were matched 1:1 to those receiving tac based on transplant date, decade of age, induction immunosuppression, and CMV mismatch. Tac patients were followed from the matched date of bela conversion. Baseline demographics collected were cause of kidney failure, bela dosage, incidence of infections, hospitalizations, biopsy-proven acute rejection (BPAR) and mortality. Patients were followed until study conclusion, death, or discontinuation of bela. The primary outcome was the incidence of an infection. Outcome data was calculated using chi-square, Fisher's exact test, or student's t-test where appropriate.

Results: A total of 328 matched patients (164 bela, 164 tacrolimus) were included in the analysis with no differences in baseline characteristics. Median time from transplantation to bela conversion was 254 days (IQR 102 - 597). Median time of overall bela exposure was 584 days (IQR 274 - 1022). 119 patients had at least one infection, 42.7% in bela vs 29.9% in tac (RR 0.7; 95% CI: 0.520 - 0.936). Median time to infection post-conversion was 304 days in bela vs 267 days in tac (p = 0.927). There were no significant differences in the incidence of infections between groups, except for bacterial pneumonia leading to hospitalization which occurred in 11 patients; 10 in bela and 1 in tac (RR 0.1; 95% CI: 0.017 - 0.595). There were 43 initial episodes of BPAR post-conversion, 65.1% in bela vs 34.9% in tac (RR 0.5; 95% CI: 0.299 - 0.954).

Conclusions: In this retrospective analysis of KT recipients, bela was associated with a higher rate of bacterial pneumonia leading to hospitalization and BPAR compared to tac.

Abstract# 162

Optimal Antimicrobial Duration for Donor Positive Cultures in Kidney Transplant Recipients

J. Ferrante, K. Schnelle, M. Palettas, S. Sarwar, H. Winters, M. Chunduru, *Pharmacy, The Ohio State University Wexner Medical Center, Columbus, OH*

Purpose: Utilization of organs from infected donors carries the risk of transmission of the donor organism to the recipient. While antimicrobials are recommended in recipients for 7 to 14 days, the optimal duration is unknown. This study compared the incidence of clinical failure in kidney transplant recipients (KTR) receiving a short (≤7 days) (SC) vs long course (>7 days) (LC) of antimicrobial therapy.

Methods: This was a retrospective single center study. Adult deceased donor KTR from 10/2011 to 11/2019 were included if the recipient was treated for a positive donor blood or urine culture. KTR were excluded if they received a multi-organ transplant, donor culture data was unavailable, or the donor had a documented complicated infection. The primary outcome was 30-day incidence of clinical failure defined as rehospitalization with receipt of antimicrobials, resumption of antimicrobials for the original donor-derived infection, all-cause mortality, or graft loss. Secondary objectives included the incidence of *Clostridioides difficile* infection (CDI), multidrug resistant organisms (MDRO), and adverse effects from antimicrobials.

Results: A total of 81 KTR were included [Table 1]. Of the donor cultures, 40 were blood, 40 were urine, and both were positive in one donor. The majority of organisms were gram positive (54%). The most commonly prescribed initial therapy was a penicillin (31%) and a fluoroquinolone (28%) was the main step-down therapy [Table 2]. No difference was detected in the clinical failure composite between the SC vs LC groups (32% vs 26%, p=0.55) and no documented transmission was detected. However, more recipients in the LC group had a CDI (14% vs 0%, p=0.021) and more recipients in the SC group developed a MDRO (26% vs 9%, p=0.048). The groups were similar for the secondary outcomes of acute kidney injury, hepatotoxicity, gastrointestinal toxicity, and rash.

Conclusions: The incidence of clinical failure was not significantly different between the SC and LC groups. However, using shorter durations of antimicrobials may minimize the incidence of CDI, while maintaining the ability to prevent donor-derived infections.

Table 1. Baseline Characteristics

	SC (n=38)	LC (n=43)	p-value
Age (years), mean ±(SD)	52.6 (13.5)	50.5 (11.2)	0.448

Abstract# 163

Treatment of Biopsy-Proven Pyelonephritis of the Transplanted Kidney is Associated with Better Graft Outcomes

F. Aziz, C. Saddler, J. Alstott, K. Swanson, S. Parajuli, N. Garg, A. Djamali, D. Mandelbrot, *University of Wisconsin, Madison, WI*

Purpose: The outcomes of treatment of pyelonephritis of the transplant kidney is not known.

Methods: From 01/1998 to 12/2019, 101 patients were found to have pyelonephritis (PN) on the transplant kidney biopsy. Patients were divided into two groups: those who had positive urine for urinary tract infection (WBC ≥10/hpf with the presence of bacteria on dipstick with squamous cells < 5) (UA+PN) and those who had negative urine for urinary tract infection (UA-PN). The groups were further subdivided into patients who received antibiotics and those who did not.

Results: The mean age at transplant was 44 ± 13 years. The mean time from transplant to diagnosis of pyelonephritis on transplant kidney biopsy was 3.3 ± 4 years. The most common reason for the biopsy in this cohort was elevated creatinine (86%). 38 (37.6%) of the patients with pyelonephritis on biopsy had a negative UA. UA+PN group had significant history of previous UTIs (p=0.004) and had more clinical symptoms of UTI (p=0.01) as compared to UA-PN group. Out of 63 patients in the UA+PN group, 55 (87.3%) received antibiotics. Only 11 of the UA-PN patients (29%) received antibiotics. In the UA+PN group, E. coli was the most common microorganism (62%), followed by klebsiella pneumonia (19%). No organisms were isolated in the UA-PN group. The use of antibiotics in both the UA+PN group (p=0.03) and UA-PN group (p=0.02) was associated with improved death censored graft survival. On multivariate analysis, being white (HR=0.31, p=0.003, 95%Cl 0.142 to 0.68) and the use of antibiotics (HR=0.22, p=0.0002, 95%Cl 0.10 to 0.48) were associated with better graft survival, but evidence of infection in urine did not reach statistical significance (HR=0.52, p=0.09, 95%Cl 0.25 to 1.10). An analysis limited to the 75 patients who had no symptoms of UTI at the time of biopsy produced similar findings, including the benefits of treating biopsy proven PN with antibiotics.

Conclusions: Treatment of this finding with antibiotics regardless of evidence of infection in the urine is associated with improved graft survival. Future studies are needed to better define the risk factors and treatment strategies for this condition.

UA+PN: patient received Abx vs patient didn't receive Abx

Abstract# 164

The Metagenomic Landscape of Renal Transplant

A. Johnson[1], G. Karadkhele[2], C. Larsen[2], *[1]Emory University, Atlanta, GA, [2]Surgery, Emory University, Atlanta, GA*

Purpose: The selective targeting of T cells in transplant immunosuppression medications leads to a high rate of viral infections. Different immunosuppression regimens have been shown to have variable effects on protective immunity. We aim to use next-generation sequencing (NGS) to characterize the microvirome of renal transplant patients and examine variance in the context of immunosuppression, rejection, and clinically apparent infection.
Methods: Plasma samples are collected at baseline and at regular intervals after kidney transplant. Three patients with a total of 21 samples were selected as a pilot cohort. These patients were selected because of known clinically significant and quantified viremias (BK and CMV). Cell-free DNA was isolated from plasma using the QIAamp Circulating Nucleic Acid Kit (Qiagen). The isolated DNA was fragmented and appended with dual-indexed bar codes using the NexteraXT DNA Library Preparation kit (Illumina). Libraries were validated by capillary electrophoresis on an Agilent 4200 TapeStation, pooled at equimolar concentrations, and sequenced on an Illumina NovaSeq 6000 at 150PE to a depth of approximately 30 million reads/sample. Low quality reads were computationally removed, and adapters trimmed. Host and contaminant reads were removed, and the remaining sequences aligned against the known virome.
Results: After removal of human, contaminant, and low-quality reads, an average of approximately 400,000 reads per sample remained, representing only 2% of overall reads. Total counts of BK virus or CMV obtained from NGS were compared to viral load levels obtained clinically. The two measurements demonstrated parallel trajectories, confirming the ability of NGS methods to detect and quantify clinically significant viremias. Aligned sequences were plotted by relative abundance over time for each sample. Two samples demonstrated notable expansion of anelloviridae during the first year after transplant. In addition to anelloviridae, herpesviridae, and polyomaviridae, samples also had significant levels of retroviridae and poxviridae.
Conclusions: The microvirome is an underutilized tool to understand protective immunity in the transplant population. We plan to expand this method to banked samples for an additional 20 kidney transplant patients to study the influence of medications and other clinical features on the microvirome. We will also use a complementary contig assembly method to strengthen the mapping of reads to the known virome.

Abstract# 165

Impact of High-Risk EBV Discordance Status on Survival Outcomes in Kidney Transplant Recipients: A Multivariable Analysis

A. Dinesh[1], S. Jackson[2], T. L. Pruett[1], S. Riad[3], *[1]Division of Transplantation, Department of Surgery, University of Minnesota, Minneapolis, MN, [2]Biostatistics, Analytics Consulting Services- Solid Organ Transplant, M Health Fairview, Minneapolis, MN, [3]Department of Medicine, University of Minnesota, Minneapolis, MN*

Purpose: High-risk EBV discordance has been linked to Post-Transplant Lymphoproliferative Disorder (PTLD) after kidney transplantation; however, the impact on recipient and graft survival is under-reported. We sought to examine the survival outcomes by EBV concordance status.
Methods: We retrospectively reviewed all primary kidney transplant recipients from 2008-2019. At our institution, we use Thymoglobulin (r-ATG) induction with early steroid withdrawal followed by CNI plus MMF maintenance. We grouped the patients according to EBV status into high-risk status recipients (EBV IgG R-/D+) (n=62) and low-risk status recipients (EBV IgG R+/D+, R+/D- or R-/D-) (n=1224). Kaplan-Meier curves were generated for recipient survival, death-censored graft survival, and EBV infection-free survival. We examined the effect of EBV high-risk status on outcomes of interest in a multivariable Cox proportional hazards model adjusted for age, gender, race, BMI, maintenance immunosuppression, and donor type. EBV-free survival was not modeled due to severe proportional hazard violations.
Results: In univariate analysis, neither patient (log-rank, p=0.466) nor death censored graft survival (log-rank, p=0.349) differed between low and high-risk groups. However, EBV-free survival was significantly lower in the high-risk group (log-rank, p<0.001). In the multivariable model, high-risk EBV status was associated with a 2.3-fold increased risk of mortality compared to low-risk status [HR 2.3, 95% C.I. (1.09, 4.76), p=0.03]. However, EBV status was not a predictor for death-censored graft survival in the adjusted model. The live-donor kidney was associated with 52% improved patient survival and 64% improved graft survival, independent of EBV status.
Conclusions: In primary kidney transplant recipients receiving r-ATG induction immunosuppression followed by CNI plus MMF maintenance with early steroid withdrawal, the incidence of post-transplant EBV viremia is significantly higher in the (R-/D+) group. As compared to low-risk status recipients, EBV high-risk status recipients had increased mortality.

Kidney

Kidney Desensitization/KPD

Abstract# 166

Desensitization Using Clazakizumab® (anti-il-6) in Highly-hla Sensitized Patients Awaiting Kidney Transplant (nct03380962)

A. A. Vo[1], N. Ammerman[1], E. Huang[1], M. Toyoda[2], S. Ge[2], A. Peng[1], R. Najjar[1], S. Sethi[1], S. Williamson[1], C. Myers[1], K. Lim[1], M. Gillespie[1], S. Jordan[1], *[1]Kidney Transplant, Cedars Sinai Medical Ctr, Los Angeles, CA, [2]Transplant Immunology Laboratory, Cedars Sinai Medical Ctr, Los Angeles, CA*

Purpose: IL-6 is a critical cytokine for plasma cell IgG production. Clazakizumab (CSL Behring LLC) is a humanized monoclonal aimed at the cytokine IL-6. Here we report on 12M follow-up of Phase I/II study of Clazakizumab for DES in highly-HLA sensitized (HS) patients.

Methods: Twenty HS patients received PLEX x5 followed by IVIg 2gm/kg X1; then claza, 25mg SC Q4W X6, with monitoring of HLA antibody and immune parameters. Study end points examined reduction in HLA MFI, rates of transplantation and DSAs pre-& post-tx. Transplanted patients received claza 25mg SC Q4W for up to 12M post-tx, induction with alemtuzumab, and maintained on tac/mmf/pred and protocol biopsy @6M.

Results: Eighteen of 20 showed reduction of HLA MFI after desensitization; 16 were transplanted. Time from dialysis to transplant was 102±54M and from last claza to transplant was 2.5±3.5M. All patients had previous transplants; 63% had cPRA 99-100%, 50% were FCMX+ and 75% were DSA+ @transplant. Figure 1A shows % reduction in MFI specificities after desensitization for CI+II of individual patient. Figure 1B shows that claza Des resulted in a mean reduction of MFI of 45±33% for CI+II HLA antibodies. Figure 2 shows reduction of DSA MFI pre ->12M post-tx. One patient had detectable DSA out to 12M post-tx. Three patients developed rejection CMR/cABMR episodes. Mean eGFR @12M was 56±30ml/min.

Conclusions: Claza treatment resulted in a significant reduction in MFI for CI&II specificities. Only 1 patient had detectable DSAs after 12M post-tx. Clazakizumab appears promising as a desensitization agent when used with PLEX+IVIg.

Abstract# 167

The Effect of Daratumumab (Dara, Humanized Anti-CD38 Monoclonal Antibody) on Immune Cells In Vitro and in a HLA-Sensitized Kidney Transplant Patient (HS KTx Pt) Desensitized (DES) with Dara

S. Ge[1], M. Chu[1], A. De Guzman[1], E. Ortiz[1], A. Vo[2], N. Ammerman[2], S. C. Jordan[2], M. Toyoda[1], *[1]Transplant Immunology Laboratory, Cedars Sinai Medical Center, Los Angeles, CA, [2]Comprehensive Transplant Center, Cedars Sinai Medical Center, Los Angeles, CA*

Purpose: Antibody-Mediated Rejection (ABMR), primarily mediated by B cells, plasma cells (PC) and antibodies (Ab), is an obstacle for successful transplantation in HS KTx Pts. Removal of those by Dara is a promising treatment for DES and ABMR. Here, we investigated the effect of Dara on immune cells (IC) in vitro and in a HS KTx Pt with Dara-DES.

Methods: CD38 expression on IC in normal control (NC) whole blood, and IC numbers in NC PBMC incubated w/ Dara (0-500μg/ml, 0-48 hrs) were measured by flow cytometry. IC profiles pre- and post-Dara (1wk post-1st and 3rd, and 1M post-4th Dara) in a HS KTx Pt with DES w/plasma-exchange + IVIG followed by weekly Dara (16 mg/kg IVPB, ×4) were tested by flow cytometry. Ab-CD16-mediated NK cell (NK) response in Pt PBMC was tested by the modified allo-CFC where Pt PBMC was stimulated with Ab-coated allo-PBMCs followed by intracellular IFNγ+ NK detection.

Results: 100% of monocytes (M), >90% of NK, 80% of B cells (B), 40-50% of T (T) cells expressed CD38. The CD38 expression level is the highest in PC and plasmablasts (PB), high in Breg, NK and M, and moderate in T and the remaining cells. After NC PBMC incubation w/ Dara, the number of M and all lymphocyte (L) cell subsets decreased at 24 & 48 hrs vs. 0 hr in a dose dependent manner. NK% in L significantly decreased, while T% & B% in L did not. A similar IC change was seen in the Dara-treated patient (Table 1); The number of M and all L cell subsets significantly decreased post-Dara. The NK% in L significantly decreased even at 1M post-4th Dara, while the change in T% & B% in L, and follicular T helper (Tfh)% and Treg% in CD4+ T (T4) was minimal. IFNγ+ cell% in NK in the modified allo-CFC decreased post-Dara (2.06, 2.32, 0.51 and 1.23, respectively), while those in NC PBMC tested as control at each time point showed similar NK response (24.8, 33.7, 31.5 and 34.9, respectively). Anti-HLA Ab Class I &II score reduced post-Dara from 619 to 513.

Conclusions: Dara significantly reduced the number of M and L, especially NK, high CD38 expressing cells, and likely PC and PB as well as anti-HLA Ab decreased post-Dara. It also reduced Ab-CD16-mediated NK activation in Dara-treated Pt. This suggests possible utility of Dara for DES or ADCC-mediated ABMR treatment in HS KTx Pts.

Patient Immnune Cell Profile Pre-& Post-Dara

Cell% in Parent Cells	In Leukocytes		In L			In T4 Cells	
	M%	L%	T3%	B%	NK%	Treg%	Tfh%

Abstract# 169

Additional Value to Participation in a National Paired Kidney Exchange Program: Exploring Characteristics of Chain End Living Donors and Waitlist Recipients

N. Osbun[1], A. Thomas[2], M. Cooper[3], S. Flechner[4], D. Segev[2], J. Veale[1], *[1]Urology, University of California Los Angeles, Los Angeles, CA, [2]Johns Hopkins University, Baltimore, MD, [3]Medstar Georgetown Transplant Institute, Washington DC, DC, [4]Cleveland Clinic, Cleveland, OH*

Purpose: Non-directed kidney donors can initiate living donor chains that end to patients on the deceased donor waitlist. While many studies of paired exchange practices focus on the whole population of transplant recipients, the characteristics and outcomes of chain end recipients may differ from other paired exchange recipients due to their history on the kidney wait list.

Methods: In this retrospective cohort study we compared 748 National Kidney Registry (NKR) chain end recipients to controls from the NKR and the Scientific Registry of Transplant Recipients between February 2008 and June 2019.

Results: : Compared to other living donor recipients, chain end recipients were more often older, black, publicly insured, and spent longer on dialysis. Black patients received chain end kidneys at a rate approaching that of receiving deceased donor kidneys (31% vs 33%, p=0.2). Chain end donors were older and had slightly lower glomerular filtration rates and higher Living Kidney Donor Profile Index (LKDPI) scores. There were 127 (17%) of chain end kidneys with a LKDPI<0, meaning they were predicted to outperform any deceased donor kidney. Chain end blood type O donors had similar characteristics to other O donors in NKR. There was a similar cumulative incidence, but an increased adjusted hazard, of graft failure among chain ends compared to other living donor recipients. No difference in mortality was seen after adjusting for recipient, donor, and transplant factors. Compared with deceased donor recipients, NKR chain end recipients had lower graft failure (5 year: 6.9% vs 12.5%, p<0.001) and mortality (5 year: 7.2% vs. 14.4%, p<0.001).

Conclusions: These findings demonstrate high donor quality at chain end. Sharing non-directed donors among a multicenter network may improve the diversity of recipients who benefit from living donation.

Table 1.

Abstract# 170

Kidney Paired Exchange in Children in the United-states

J. Hogan[1], A. G. Thomas[2], J. Verbesey[3], D. L. Segev[4], *[1]Transplant Research Center, Department of Surgery, Emory University, Atlanta, GA, [2]Department of Epidemiology, University of North Carolina, Chapel Hill, NC, [3]Department of Surgery, Medstar Georgetown Transplant Institute, Washington, DC, [4]Department of Surgery, Johns Hopkins University, Baltimore, MD*

Purpose: Kidney paired exchange (KPE) plays an increasing role in the landscape of adult living donor transplant (LDTx) in the US. LDTx is the treatment of choice in children with end-stage kidney disease. Despite the allocation of high quality transplants from deceased donors and relatively short waiting times in children, improving access to living donor transplant is of high importance. In this study, we describe the characteristics and outcomes of pediatric transplants performed through KPE.

Methods: We studied 5,022 pediatric (recipient age≤21) living donor transplants (2/2008-12/2019), including 128 National Kidney Registry (NKR) transplants, using the Scientific Registry of Transplant Recipients (SRTR) linked with the NKR database. We compared death-censored graft failure (DCGF) and mortality between NKR recipients and three control groups (1) all non-NKR SRTR living donor recipients, (2) all non-NKR unrelated SRTR living donor recipients, and (3) all non-NKR SRTR paired exchange recipients.

Results: There were 352 pediatric KPE transplants during the study period (36% participated in NKR). Among NKR pediatric recipients, 44% were female, 23% were African American (AA), 14% were Hispanic, and the median age was 16 (Figure 1). Compared to SRTR controls, NKR pediatric participants were more often AA (23% vs 9%, p<0.001), less likely to receive preemptive transplant (28% vs. 38% p=0.02), more often had a previous transplant (27% vs. 9%), and more often had a PRA>80 (23% vs. 4%, p<0.001). NKR participants experienced longer cold ischemia times (median 8 vs. 1 hour) but did not experience increased risk of delayed graft function (4% vs 3%, p=0.6), 5-year DCGF (5% vs. 0.5%, p=0.1), or 5-year mortality (1.7% vs. 1.9%, p=0.2).

Conclusions: The use of KPE to improve access to LDTx in children increased over the last decade. This especially benefited children with traditionally lower access to LDTx such as AA and highly sensitized patients and demonstrated good patients and transplant outcomes similar to non-KPE LDTx.

Abstract# 171

Right Kidneys and Kidneys with Complex Anatomy are More Likely to be Transplanted to the Waiting List in a National Kidney Paired Donation Program

N. Osbun[1], A. Thomas[2], A. Waterman[3], J. Veale[1], D. Segev[2], D. Leeser[4], *[1]Urology, University of California Los Angeles, Los Angeles, CA, [2]Johns Hopkins University, Baltimore, MD, [3]University of California Los Angeles, Los Angeles, CA, [4]East Carolina University, Greenville, NC*

Purpose: In the era of laparoscopic donor nephrectomy, there is a preference for left kidneys with a single renal artery. In paired exchange, the receiving transplant center may have less control over the donor nephrectomy and may receive a right kidney or a kidney with complex anatomy (more than one renal artery or renal vein). Despite clear evidence on adverse outcomes in living donor transplantation, these organs may be deemed less desirable and instead sent to the deceased donor waiting list at the end of a paired exchange chain.

Methods: Using data from the national transplant registry (SRTR) and the National Kidney Registry (NKR) with anatomy data, we describe the end of chain distribution and outcomes of right and complex kidneys (2/2008-12/2019). We also assessed center-level behavior in the transplantation of these organs.

Results: Out of 3,383 eligible NKR transplants, there were 431 (12%) right kidneys transplant and 857 (25%) complex kidneys transplanted. Out of 703 chain ends (transplants to the waiting list), 114 (16%) were right and 207 (28%) were complex kidneys. There were 41 (6%) chain end kidneys that were right and complex. Right, complex, and right/complex kidneys were more likely to be transplanted to the list ($p<0.001$), although the absolute difference is small. There were no statistically significant differences in delayed graft function, death-censored graft failure, or mortality when comparing NKR recipients of left/normal chain end kidneys to right and/or complex kidneys. Center-level practice varied significantly. Among 94 NKR centers, 13 never utilized a right or complex kidney. Among 73 centers receiving a chain end kidney, 39 centers used right chain end, 50 centers used a complex chain end, and 22 used a right/complex chain end.

Conclusions: Despite insignificant differences in outcomes, many NKR centers avoid right and/or anatomically complex kidneys. Right and/or complex kidneys were more likely to be sent to the waiting list instead of being used in paired exchange chain or loop. Anatomically complex and right living donor kidneys from the National Kidney Registry, and other KPD systems, are an important source of kidneys for patients on the deceased donor waiting list.

Abstract# 172

The Benefits of Sharing Non-Directed Donors Nationally Through Paired Exchange

J. Verbesey[1], A. G. Thomas[2], A. D. Waterman[3], J. Vucci[1], G. Vranic[1], A. Gilbert[1], S. Ghasemian[1], M. Cooper[1], *[1]Georgetown University Hospital, Washington, DC, [2]Johns Hopkins University School of Medicine, Baltimore, MD, [3]UCLA, Los Angeles, CA*

Purpose: Non-directed donors (NDDs) are a valuable resource that can "unlock" incompatible transplants. Recent advances in paired kidney exchange (PKE) suggest that NDDs may facilitate a greater than expected number of transplants, while receiving additional protections by PKE participation. In 2019, the largest PKE clearinghouse in the US, the National Kidney Registry (NKR), transitioned NDDs to the Family Voucher (FV) program, where living donors (LDs) can name up to 5 family members to receive vouchers for a future kidney should they need one. As a leading center in the NKR, we performed a retrospective review of our NDD/FV donors in an effort to expand the program in the future.

Methods: Retrospective cohort study of LD transplants at a single center from 1/2015 to 12/2020. Additional data on PKE transplants used NKR data. We assess clinical characteristics of NDDs, including those in the FV program and NKR Advanced Donation Program (ADP) donors who donate in advance of their intended recipient.

Results: During the study period, our center had 45 NDDs (15 in 2015-2018, 30 in 2018-2020). NDD demographics: 51% male (n=23), 97.8% Caucasian (n=44), mean age 45 years, mean BMI 25.36. NDD blood types: 48.9% O, 40% A. NDDs plus 28 ADP donors enabled 162 resultant transplants (Table 1). This included 36 highly sensitized (PRA > 80%) patients, including 15 who had PRA > 98% (Table 2), and 71 DD waitlist patients that received LD kidneys as end chain recipients (Table 3). For the highly sensitized patients, average wait time for PRA > 80% went from 4.74 years to 3.33 months, and PRA > 98% went from 4.33 years to 6 months. For the past 2 years, NDDs and FV donors represent 25-27% of the NKR donor population; since 2020 virtually all NKR NDDs are in the FV program.

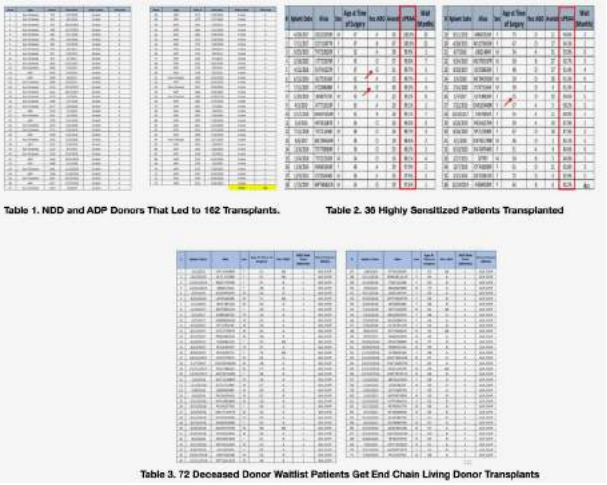

Table 1. NDD and ADP Donors That Led to 162 Transplants.

Table 2. 36 Highly Sensitized Patients Transplanted

Table 3. 72 Deceased Donor Waitlist Patients Get End Chain Living Donor Transplants

Conclusions: Our results show that a single center can see a dramatic rise in volume and decrease in wait time from full participation in a national PKE. NDDs were diverse in age and gender, although almost universally Caucasian. Since the FV program benefits future generations, centers should concentrate on exposing potential AA donors to this option. The FV program offers donors a voucher, in addition to other donor protections like travel reimbursement and insurance. Centers throughout the country should be working to educate their patients as to this option. By putting NDDs into a PKE, numerous highly sensitized patients and many on the deceased donor waitlist can receive transplants, and the addition of these donors will lead to much higher transplant rates overall.

Kidney Complications

Abstract# 173

Mapping Chronic Kidney Disease (CKD) and Acute Kidney Injury (AKI) in Kidney Transplant Biopsies Reveals Two Classes of Early AKI That Differ in Their Response-to-Wounding

P. Halloran[1], J. Reeve[1], G. Böhmig[2], O. Viklicky[3], M. Myslak[4], G. Gupta[5], &. the INTERCOMEX Study Group[6], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]Medical University of Vienna, Vienna, Austria, [3]Institute for Clinical and Experimental Medicine, Prague, Czech Republic, [4]Pomeranian Medical University, Szczecin, Poland, [5]Virginia Commonwealth University, Richmond, VA, [6]., ., AB, Canada*

Purpose: We recently analyzed injury-induced molecular changes in kidney transplant biopsies using principal component analysis (PCA) (AJT https://doi.org/10.1111/ajt.16374). PC1 reflected all injury, PC2 distinguished early AKI (negative) vs. late CKD (positive). Positive PC3 discovered a new type of injury response: increase in epithelial polarity genes (e.g. PARD3) with minimal inflammation that adversely impacted survival in early transplants. Negative PC3 reflected inflamed injury e.g. TCMR. We explored how these features could be used to classify injury in kidney transplantation.

Methods: We studied 1526 indication biopsies, using archetypal analysis of injury-induced transcripts to assign injury archetype classes to each biopsy.

Results: Six injury archetype groups emerged: 1. AKI1; 2. AKI2; 3. Minor injury; 4. CKD (atrophy-fibrosis); 5. CKD+AKI; and 6.Normal (Fig. 1A). The robustness of this classification was validated in a new independent set of 1426 biopsies (Fig. 1B). When all 1526 biopsies were distributed in UMAP and the failures were visualized by triangles, most failures were related to CKD, but AKI1 had relatively common failure (Fig.1C). In random forests comparing rejection ("R") and injury ("I") scores, injury PC1, PC3, and archetype scores were the main determinants of three-year survival (Fig.1D).

Donor age was highest in AKI1 and AKI2, and lowest in Minor and Normal, which had the best GFR. AKI and AKI2 kidneys similar rates of delayed graft function (DGF) and low GFR. After removing all rejection, AKI1 had much lower expression of molecular and histologic inflammation than AKI2, low PC1, low expression of injury-induced genes, but high PC3. Among biopsies <6 weeks post-transplant with no rejection, AKI1 kidneys had significantly worse survival than AKI2 (12/46 vs. 3/39, p<0.05), suggesting poor response-to-wounding in AKI1.

Conclusions: While many kidney transplants fail with CKD, early AKI can also lead to failure, particularly AKI1. Kidneys in the AKI1 state fail to initiate appropriate healing/recovery responses, probably related to the features annotated in injury PC3.

Abstract# 174

Oxalate Nephropathy After Kidney Transplant: Defining Histological Patterns, Contributing Factors and Graft Outcome

N. Jakob[1], A. Chuu[1], J. Ninan[1], E. Lim[1], N. Zhang[1], H. Amer[2], F. Cosio[2], H. Wadei[3], M. Ryan[1], C. Cortese[3], L. Cornell[2], M. Keddis[1], *[1]Nephrology, Mayo Clinic, Scottsdale, AZ, [2]Nephrology, Mayo Clinic, Rochester, MN, [3]Nephrology, Mayo Clinic, Jacksonville, FL*

Purpose: The objective of this study is to evaluate KTx recipients with biopsy proven oxalate nephropathy (ON) to better define risk factors, histologic patterns and graft outcome in patients without primary hyperoxaluria (PH).

Methods: All renal allograft biopsy reports from 2008 to 2018 at the three Mayo transplant centers (Arizona, Florida, Minnesota) were queried for pathologist diagnosis of ON and verified by chart review. All patients with PH diagnosis were excluded. Risk factors for enteric causes for ON, histological findings, serum and urine oxalate levels around time of biopsy, treatment, and allograft outcomes were analyzed.

Results: 36 patients were identified. Mean age at diagnosis of ON was 57.5 years, 50% were female, 83.3% white, 88.9% first KTx, and 36% were pre-emptive to Tx. Most common cause of ESRD was diabetes (36%), and 11.1% due to enteric oxalosis. 17% had pre-KTx history of kidney stones. Median baseline GFR was 43.8ml/min. Median time from KTx to ON diagnosis was 6.9 months (range 1.25-47 months). Diarrhea was the most prevalent risk factor in 42% of patients. Enteric disorders were identified in 83% of patients as shown in Figure 1. 61% of patients had stage II or III acute kidney injury (AKI) and 55.6% required dialysis at the time of biopsy. Plasma oxalate (median 15.7micromol/L, n=25), and urine oxalate (median 58.1mg/24hr, n=21) were elevated. Histological findings are described in table 1. Management included low oxalate diet education (64%), calcium supplementation with food (61%), pyridoxine (14%), and steroid treatment (81%). After a median follow-up of 33.5 months, median eGFR was 27.7ml/min, with 53% of patient with eGFR<30ml/min.

Conclusions: This is the largest case series of ON after KTx showing that enteric causes account for 83% of cases and chronic diarrhea is a common risk factor. Severe AKI and acute tubular injury are common. Despite low rates of severe inflammation or IFTA, there was a significant drop in GFR from baseline to last follow-up. Further studies need to define histologic characteristics linked with adverse outcomes.

Table 1. Histologic characteristics

Total number of glomeruli, median (range)	20 (13, 28)
Number of tubules with intratubular calcium oxalate crystals, median (range)	22 (16, 30)
Interstitial inflammation **Moderate-severe**	22 (61%) 4 (11%)
Interstitial fibrosis and tubular atrophy **Moderate-severe**	22 (61%) 4 (11%)
Acute tubular injury (ATI)	34 (94%)

KIDNEY

Abstract# 175

Kidney Donor Risk Index: Significance as a Predictor of Kidney Transplant Outcomes Beyond Allograft Survival, Analysis of 18 Adjusted Regression Models Involving Adult Deceased Donor Kidney Recipients

A. Santos, E. Bueno, M. A. Leghrouz, *University of Florida, Gainesville, FL*

Purpose: We aimed to study the role of kidney donor recipient index (KDRI) as a predictor for multiple transplant-related outcomes in adult deceased-donor (DD) kidney transplant (KT) recipients (KTR).

Methods: Using OPTN data, we used multivariable logistic regressions to analyze the 1-yr. post-kidney transplant likelihood of acute rejection (AR), delayed graft function (DGF), and hospitalization; and multivariable Cox models to analyze 5-year risks of overall graft loss (OAGL), death, and death-censored graft loss (DCGL) inDD- KTRs stratified into groups based on CPRA levels of <10%, 10%-79%, and >/=80%. In all the 18 regression analyses, we used a uniform set of 14 risk factors (RF)s including kidney donor risk index by Rao (KDRI-Rao). We used the Wald Chi-sq. P for each model in classifying RF as a significant (P<.05) and/or highly significant (P<.0001) outcome predictor.

Results: Among over sixty-two thousand DDKTRs studied, KDRI-Rao was the most highly significant risk factor (RF) with a P<.0001 for all (100%) outcomes (OAGL, death, DCGL, AR, DGF, and hospitalization) in all CPRA groups (**Fig. 1**). Ethnicity/ race of KTRs and maintenance immunosuppression regimen at discharge were significant RFs (P<.05) in 100% and highly significant RFs (P<.0001) in 89% and 67% of analyses conducted, respectively (**Fig. 1**). Induction agent, HLA mismatch (HLA-mm), and recipient age group were significant or highly significant RFs for 1-year AR in all CPRA groups (**Table 1**). Cold ischemia time is a highly significant RF for DGF and pre-transplant dialysis as well as insurance type were significant RFs for DGF and hospitalization in all CPRA groups (**Table 1**). Finally, recipient age group was a highly significant RF; while pre-transplant dialysis duration and insurance type were significant RFs for 5-year (OAGL, death, DCGL) outcomes (**Table 1**).

Conclusions: KDRI-Rao is a consistent highly significant predictor of allograft and other important outcomes after adult DDKT. Therefore, KDRI or its derivative kidney donor performance index (KDPI) should be considered in adjustments of multivariable models in adult kidney transplant studies.

Abstract# 176

The Effect of Delayed Graft Function on Early versus Late Mortality Following Kidney Transplantation

W. Irish[1], Y. Fu[2], D. B. Leeser[1], K. V. Ravindra[3], C. Haisch[1], J. Tuttle[1], *[1]Surgery, East Carolina University, Greenville, NC, [2]Mathematics, East Carolina University, Greenville, NC, [3]Surgery, Duke University, Durham, NC*

Purpose: Delayed graft function (DGF) is associated with increased risk of long-term graft survival but it's impact on patient survival has not been studied. Using data from the Organ Procurement and Transplantation Network (OPTN) database, we evaluated the effect of DGF on early versus late mortality following kidney transplantation (KTx).

Methods: Data on adult (age ≥ 18 years), solitary, primary, deceased donor KTx (2005-2015) were obtained from the OPTN. Pediatric recipients, and recipients of previous KTx or multi-organ transplants were excluded. DGF was defined as the need for dialysis within the first seven days post-transplant. Time-dependent Cox's hazard model was used to evaluate the effect of DGF on early versus late risk of mortality following KTx. Early mortality was defined as death within the first-year post-KTx. Hazard ratio (HR) and 95% confidence interval (CI) are provided as measures of strength of association and precision, respectively. Results are adjusted for donor age, kidney donor profile index, donation after cardiac death, recipient age, sex, race, and history of diabetes, and transplant year.

Results: 95,271 patients were eligible for study (mean age (SD) = 53.5 (13.0) years, 60.6% were male and 33.3% were Black). Of these, 25.8% had DGF. The prevalence of DGF ranged from 24.4% in 2005 to 29.9% in 2015. Median follow-up was 7 years. Of the 95,271 patients, 27.0% died (33.5% with DGF versus 24.7% without DGF). One-, 5- and 10-year patient survival was 93.1%, 75.9% and 47.3% with DGF, respectively, versus 96.9%, 85.1% and 62.0% without DGF (log-rank p<0.0001). For early mortality, the adjusted HR for DGF versus No DGF was 2.02 (95% CI=1.89, 2.15). For mortality after 1-year post-KTx, the adjusted HR for DGF versus No DGF was 1.42 (95% CI=1.37, 1.46). Further breakdown of the time-dependent effect of DGF on the risk of mortality is provided in Table 1.

Conclusions: DGF has a significant impact on mortality. The effect of DGF on mortality is more pronounced in the first-year post-KTx, but is still impactful even after 5-years post-KTx.

Table 1: Time-dependent Effect of DGF on Risk of Mortality Following Kidney Transplantation

Time-dependent Risk	Adjusted Hazard Ratio for DGF versus No DGF (95% CI)
<= 1 year	2.20 (1.89, 2.15)
Between 1 and 2 years	1.50 (1.37, 1.63)
Between 2 and 3 years	1.39 (1.27, 1.51)
Between 3 and 4 years	1.51 (1.40, 1.64)
Between 4 and 5 years	1.40 (1.29, 1.52)
> 5 years	1.39 (1.33, 1.45)

Abstract# 177

Outcomes of Kidney Transplant Recipients With Sickle Cell Disease: An Analysis of the 2000-2019 UNOS/OPTN Database

N. Leeaphorn[1], C. Thongprayoon[2], C. Jadlowiec[3], A. Chewcharat[4], P. Hansrivijit[5], S. Katari[1], P. Vaitla[6], L. Cummings[1], M. Cooper[7], W. Cheungpasitporn[2], *[1]Saint Luke's Health System, Kansas City, MO, [2]Mayo Clinic, Rochester, MN, [3]Mayo Clinic, Phoenix, AZ, [4]Mount Auburn Hospital, Cambridge, MA, [5]University of Pittsburgh Medical Center Pinnacle, Harrisburg, PA, [6]University of Mississippi Medical Center, Jackson, MS, [7]Medstar Georgetown Transplant Institute, Washington, DC*

Purpose: Lower patient survival has been observed in sickle cell disease (SCD) patients who go on to receive a kidney transplant. This study aimed to assess the post-transplant outcomes of SCD kidney transplant recipients in the contemporary era.

Methods: We used the OPTN/UNOS database to identify first-time kidney transplant recipients from 2010 through 2019. We compared patient and allograft survival between recipients with SCD vs. all other diagnoses (non-SCD) as the reported

cause of end-stage kidney disease. We examined whether post-transplant outcomes improved among SCD in the recent era (2010-2019), compared to the early era (2000-2009).

Results: This study included 105 SCD and 146,325 non-SCD kidney transplant recipients. SCD recipients were younger, more likely to be female, African-American, and have a lower body mass index. They were more likely to have a higher panel reactive antibody and be on dialysis at the time of transplant. Five-year death-censored graft survival in SCD was lower than non-SCD recipients (71% vs. 89%; p<0.001), whereas five-year patient survival was comparable between two groups (83% vs. 87%; p=0.12). After adjusting for differences in baseline characteristics, SCD was significantly associated with lower patient survival (HR 2.87; 95% CI 1.75-4.68, p<0.001) and death-censored graft survival (HR 1.98; 95% CI 1.30-3.01, p=0.001), compared to non-SCD recipients. When we further investigated outcomes, compared to recipients with diabetes mellitus, hypertension, and glomerular disease as a cause for their end-stage kidney disease, SCD was significantly associated with lower patient survival and death-censored graft survival. There were no differences in patient survival (p=0.61), and death-censored graft survival (p=0.38) of SCD recipients in the recent and early era.

Conclusions: Patient and allograft survival in SCD kidney recipients were worse than recipients with other diagnoses. The outcomes of SCD in the recent era did not improve from the early era. Thus, there is an urgent need for scientific research on interventions to improve post-transplant outcomes of SCD kidney transplant recipients.

Abstract# 178

Worsening Impact of Acute Kidney Rejection on Long Term Graft Survival from 2000 to 2014

D. Leeser[1], W. Irish[1], K. Ravindra[2], V. Villani[2], A. Connor[2], J. Tuttle[1], *[1]Surgery, East Carolina University, Greenville, NC, [2]Surgery, Duke University, Durham, NC*

Purpose: Acute rejection (AR) has been shown to impact graft survival after kidney transplant (KTx), however there is limited data on its impact on long term graft outcomes. We sought to study how this impact has changed over time.

Methods: Using data from the Organ Procurement and Transplantation Network (OPTN) database, we studied adult (age ≥ 18 years) recipients of an isolated, ABO-compatible, kidney transplant in the period between January 2000 and December 2014. Patients were divided in two groups: AR group and no rejection group (NR), based on the presence of both an AR episode and treatment recorded on the OPTN database at one-year post-KTx. Patients lost to follow-up within one year, or whose rejection status was unknown were excluded. A multivariable Cox's hazards model was used to evaluate the association between AR and the risk of death-censored graft failure (DCGF). Hazard ratio (HR) and 95% confidence interval (CI) are provided as measures of strength of association and precision, respectively. Results are adjusted for donor age and donor type, recipient age, gender, race and diabetes status at transplant, total HLA mismatches at the A,B,DR loci, calculated panel reactive antibodies, delayed graft function and maintenance immunosuppression at one-year post-KTx.

Results: 154,399 patients were included in the study (60%/40% deceased/living donor); of these 10.3% had AR. There was a decrease in AR over time, from 17.6% in 2000 to 6.0% in 2014. Median follow-up was 7 years. Cumulative incidence of DCGF at 7 years post-KTx was 26.6% in the AR group versus 12.9% in the NR group (HR 1.77, 95% CI 1.71-1.83). AR HR increased over time, from 1.34 (95% CI 1.22-1.47) in 2000 to 3.44 (95% CI 2.32-5.10) in 2014. (Figure 1).

Conclusions: Despite the steady decline in the prevalence of AR, AR has a clinically significant impact on long term graft survival. This impact has worsened from 2000 to 2014 which suggest AR seen now may be much worse than in the past - likely due to selection of higher immunological risk patients with increased use of induction immunosuppression and a higher proportion of antibody mediated rejection. AR is still a clinically relevant event and strategies to minimize its occurrence are needed to mitigate long-term graft loss.

Abstract# 179

Angiotensin II Type-1 Receptor Antibodies are Associated with Inferior Renal Allograft Survival

P. Martin, E. Santos, N. Gunby, M. Willicombe, *Renal Department, Imperial College Healthcare NHS Trust, London, United Kingdom*

Purpose: AT1R-antibodies have been implicated in antibody-mediated vascular rejection in the absence of detectable HLA donor specific antibody (DSA), in addition to cardiovascular diseases. Transplant renal artery stenosis (TRAS) or macrovascular disease has also been shown to be associated with rejection. We aim to investigate the prevalence and outcomes of AT1R antibodies in patients undergoing angiography for suspected TRAS with biopsy proven rejection.

Methods: 82 patients with no HLA DSA were identified and serum at the time of angiography was tested for AT1R-Abs using an enzyme-linked immunosorbent assay technique. A threshold of >17u/ml was considered a positive result. Prospectively collected outcomes up to 5 years were obtained from our unit's transplant registry.

Results: The prevalence of AT1R-Abs was high at 21/82 (26%). 49/82 (59.8%) of patients were found to have significant TRAS at the time of angiography, 13/49 (26.5%) of patients with TRAS had Abs compared with 8/33 (24.2%) of patients with no TRAS, p=0.82. There was no difference in gender, ethnicity, donor type, cause of ESKD, total HLA mismatch in the Ab positive versus Ab negative groups. However, Ab+ patients were more likely to be younger than Ab- patients, 46.9±12.2 versus 54.4±12.0 respectively, p=0.017. AT1R-Ab+ patients at the time of angiography had an inferior 5-year allograft survival compared with Ab- patients, p=0.017 (fig. 1). Outcome by TRAS and Ab status, showed that TRAS+Ab+ patients had significantly worse outcomes than either TRAS+Ab- and TRAS-Ab+ patients, p=0.009 (fig. 2).

Conclusions: In a highly selected patient population, we found a high prevalence of AT1R-Abs. Although we found no association with TRAS, further work is underway to compare the prevalence with patients with normal renal artery imaging. Importantly, we did find a negative association with allograft survival, which highlights the potential importance of AT1R-Abs in renal transplantation which warrants further investigation.

Abstract# 180

Post-Transplant Idiopathic Immune Complex Glomerulonephritis

F. Aziz, T. Singh, N. Garg, D. Mandelbrot, *University of Wisconsin, Madison, WI*

Purpose: The appropriate treatment for post-kidney transplant immune complex glomerulonephritis (ICGN) of unknown cause is unclear.
Methods: From 01/2004 to 12/2018, 71 patients were diagnosed with post-transplant ICGN on transplant kidney biopsies. Forty-one of these were found to have post-transplant idiopathic ICGN, and were included in this study. The patients with active infection (12), acute rejection (11), IgA nephropathy (3), lupus (3) and monoclonal gammopathy (1) were excluded.
Results: The mean age of the cohort at the time of transplant was 50 ± 13 years. The mean time from transplant to the diagnosis of idiopathic ICGN was 6 ± 5 years. The most common cause of kidney failure was diabetes (49%). Only 11 (27%) patients had glomerulonephritis (9 with focal segmental glomerular sclerosis and 2 with membranous nephropathy) as the cause of their native kidney failure. The mean follow-up from the time of transplant was 9 ± 5 years. The majority of patients had proteinuria (UPC > 0.3) (93%), and only 39% had hematuria (> 3RBC/hpf) at the time of biopsy. Twenty-five patients (61%) had no change in their baseline immunosuppression. Eight patients (19.5%) received steroids alone, and eight patients (19.5%) received rituximab with (7) or without (1) steroids. The patient who received rituximab had better graft survival than the patients who received no treatment (p=0.02), but the benefit of steroids compared to no treatment did not reach statistical significance (p=0.05). The multivariate analyses retained eGFR < 30 ml/min/1.73m^2 at time of diagnosis (HR=3.30, p=0.02; 95% Cl 1.15 to 9.46) as a significant predictor of graft loss. The multivariate analyses also showed that the treatment of ICGN was associated with lower graft loss (HR=0.22, p=0.02; 95%Cl 0.06 to 0.78).
Conclusions: Although not well described in the literature, post-transplant idiopathic ICGN is an important cause of kidney allograft dysfunction. Treatment of idiopathic ICGN seems associated with better graft outcomes. Future studies are needed to determine risk factors and treatment strategies to improve grafts outcomes with idiopathic ICGN.

Liver

MELD, Allocation and Donor Issues

Abstract# 181

Improved Outcomes Over Time of Extended Criteria Donor Grafts for Acute-on-chronic Liver Failure

T. Kitajima, T. Ivanics, D. Moonka, T. Shamaa, A. Mohamed, K. Delvecchio, K. Collins, M. Rizzari, A. Yoshida, M. Abouljoud, S. Nagai, *Transplant and Hepatobiliary Surgery, Henry Ford Hospital, Detroit, MI*

Purpose: Given the high waitlist mortality of patients with acute-on-chronic liver failure (ACLF), liver transplant (LT) with an extended criteria donor (ECD) can be considered. The use of ECD livers has been associated with increased post-transplant mortality in ACLF patients. However, the trends over time for LT with ECD have not been investigated. This study aims to analyze trends in post-transplant outcomes with ECD in ACLF and determine risks associated with specific ECD criteria.
Methods: Using OPTN/UNOS data, we analyzed LT recipients with ACLF between 2004 and 2019. Patients with status 1A, multi-organ and re-transplant were excluded. ACLF was defined using EASL-CLIF criteria. In recipients with donor risk index

(DRI)≥1.7, one-year graft survival (GS) was compared between 3 eras: Era1 (2004-08), Era2 (2009-13), and Era3 (2014-19). The cut-off of 1.7 is based on the definition of marginal grafts in the literature. Donor risk factors for one-year graft loss were analyzed in each era using Cox proportional hazard model, with adjustments for recipient variables. Finally, the impact of DRI as an independent continuous predictor of one-year graft loss was evaluated in each Era.

Results: 30,080 eligible ACLF patients were identified, of whom 7,909 (26.3%), 9,511 (31.6%), and 12,660 (42.1%) were transplanted in Era1, Era2 and Era3. When comparing post-transplant outcomes in ACLF patients with DRI≥1.7, Era3 (85.1%) had significantly better 1-year GS than Era1 (75.4%, P<0.001) and Era2 (82.5%, P=0.007). On multivariable analysis, older donor (age 51-60, >60), DCD donor, and prolonged CIT (>8 hours) were independent risk factors for 1-year graft loss in Era1. In contrast, risk factors in Era2 included older donor age (age>60) and DCD, whereas in Era3 only older donor age (age 51-60, >60) was associated with 1-year graft loss (Table). On evaluation of DRI as a continuous predictor, a higher DRI was associated with an increased hazard of 1-year graft loss in Era1 and Era2. In contrast, a similar risk of graft loss was found across all DRI values in Era3 (Figure).

Conclusions: In ACLF patients, outcomes using ECD livers improved over time. Only older donor age was significantly associated with worse post-transplant outcomes across all three eras. The use of DCD graft and prolonged CIT was associated with graft loss in the earlier but not late era. DRI is not an independent risk factor for graft loss in the most current era. These findings support the contemporary use of ECD livers in ACLF patients.

Table. Donor risk factors for one-year graft loss in ACLF patients (adjusted by recipient characteristics)

Abstract# 182

Impact of Transplant Center Volume on Utilization of and Outcomes Following Donation After Circulatory Death Liver Transplantation in the United States

S. Kumar[1], S. Lin[2], J. D. Schold[2], *[1]Digestive Disease Institute, Cleveland Clinic Abu Dhabi, Abu Dhabi, United Arab Emirates, [2]Department of Quantitative Health Sciences, Cleveland Clinic Foundation, Cleveland, OH*

Purpose: Despite increased utilization of donation after circulatory death (DCD) grafts in the US, impact of center volume on DCD liver transplantation (LT) remains unclear. Our aim was to evaluate impact of center volume on utilization of DCD and outcomes.

Methods: Utilizing SRTR we evaluated all DCD LT from 2005-2019, divided into era 1: 2005-2009; era 2: 2010-2014; era 3: 2015-2019. Centers were categorized based on average annual LT as low volume (LVC): < 30, mid volume (MVC): 30-99 and high volume (HVC): ≥ 100. Primary outcome measures were graft and patient survival. A chi-square test was used for categorical and Student's t-test for continuous variables. Survival comparison was performed using Kaplan-Meier method and multivariable analysis using Cox proportional hazard models.

Results: DCD LT increased from 5.2% in era 1 to 7.7% in era 3. 77% of centers used DCD donors, with the top 10 HVCs accounting for 37% of DCD LT. Proportion of DCD LT in HVC was greater in all 3 eras (%): era 1: 7.0 vs 4.8 vs 5.2; era 2: 7.1 vs 5.1 vs 4.2; era 3: 9.6 vs. 7.6 vs. 5.6 (p<0.0001). DCD recipients in HVC were more likely to be > 50 (79% vs 78% vs 72%; p=0.006) with shorter mean time from listing to LT (206 vs 277 vs 281 days; p<0.0001) and cold ischemia time (5.87 vs 6.04 vs 6.47 hours; p<0.0001). Mean donor age (37.5 vs 34.6 vs 33.7; p<0.0001) and proportion > 50 (21% vs 15% vs 13%; p<0.0001) were higher in HVC. 1-, 3- and 5-year graft survival in LVC were comparable to MVC, but inferior to HVC (Fig 1). However, 1-, 3- and 5-year patient survival were comparable in the 3 groups (Fig 2). Multivariable analysis identified recipient age, male gender, donor age, and cold ischemia time as predictors of graft and patient survival.

Conclusions: HVCs account for a disproportionate amount of DCD LT and are more likely to transplant older recipients using older DCD donors, with shorter time from listing to LT. Expanding DCD LT in LVC and MVC may improve access and reduce waitlist mortality without compromising outcomes. Improved understanding of factors determining center variations in DCD LT will help improve organ allocation practices.

Abstract# 183

The Impact of Donor and Recipient Age Differenceon Long Term Prognosis in Young Liver Transplant Recipients

A. Pita, A. Moro, J. C. McVey, D. J. Firl, M. Fujiki, T. Diago, C. Quintini, F. Aucejo, C. D. Kwon, K. V. Menon, K. Hashimoto, B. Eghtesad, C. Miller, K. Sasaki, *The Cleveland Clinic, Cleveland, OH*

Purpose: Although the importance of donor and recipient age in liver transplant (LT) are well-studied, the prognostic influences of donor and recipient age differences are still unknown. Especially, since young recipient have a long life expectancy, the influence of the old donor liver on their long-term prognosis should be elucidated. The study aims to reveal the long-term prognostic influence of donor-recipient age difference in young recipients.

Methods: Adult patients who received initial LT using brain dead donor between 2002 and 2020 were identified from the UNOS database. Patients who received pediatric donor and split liver grafts were excluded. Young recipient was defined as ≤ 45 year old. The age difference between donor and recipient was categorized as follows: Group 1: younger than recipient, Group 2: ≤10 years older, Group 3: 10-19 years older, Group 4: 20 years or older. To examine the influence of donor recipient age difference in long-term survivors, conditional survival (CS) analysis was conducted.

Results: Among 89145 patients, 14258 patients were ≤ 45 years old (16.3%), which were categorized into 5839 (41.0%) as Group 1, 3390 (23.8%) as Group 2, 2488 (17.5%) as Group 3, 2541 (17.8%) as Group 4. The recipient and donor characteristics are summarized (Table). The actual overall survival, 5-years CS, and 10-year CS according to the donor recipient age differences are shown (Figure). Among the recipients who survived 5-years from LT, the survival curves were divided into two clusters (Group 1 and 2 vs. Group 3 and 4). This trend was more prominent when the recipient survived longer than 10 years from LT.

Conclusions: Donor and recipient age difference affected not only short term but also in long-term after LT. When the donor is ≥ 10 years older, a significant difference in survival in long-term was confirmed. Transplanting a donor liver of ≤10 years difference should be considered in young patients who are expected to have a long term prognosis.

Median (IQR)	Group 1 (<0)	Group 2 (0-9)	Group 3 (10-19)	Group 4 (≥20)	P

Abstract# 184

State-level Trend in the Prevalence of Non-alcoholic Steatohepatitis for Liver Transplant Candidates in the United States, 2001-2017

S. Chang[1], M. Wang[1], M. Pozo[2], D. Ladner[2], D. Borja-Cacho[2], *[1]Washington University School of Medicine, Saint Louis, MO, [2]Northwestern University, Chicago, IL*

Purpose: As variation in the prevalence of obesity across states continues to grow, the prevalence of nonalcoholic steatohepatitis (NASH) is also rising. However, little is known about NASH cirrhosis as the primary indication for liver transplant (LT) at the state level.
Methods: OPTN and BRFSS data from 2001-2017 were used. NASH as the primary indication for LT was defined as NASH as the primary diagnosis; and cryptogenic as the primary diagnosis and patient body mass index ≥35 or a diagnosis of diabetes. Patients' state of residency at registration was geocoded. State-level prevalence was computed for obesity, obesity+hypertension, obesity+hypertension+diabetes (per 100 state population for all above), NASH and HCC for waitlisted patients (per 10 million state population), and obesity+hypertension or obesity+diabetes (obesity+hypertension/diabetes) for donors (per 100 state donors) were assessed. Linear time trend analyses were conducted on the prevalence for each state and the entire nation. One-sided tests to detect positive linear trends were used using α=0.05.
Results: The prevalence of obesity, obesity+hypertension, obesity+hypertension+diabetes increased over time (see **Figure**). The prevalence of NASH and HCC increased in LT candidates. The prevalence of obesity+hypertension/diabetes in deceased liver donors had a significantly increasing trend (all p<0.0001). States with increasing trend in all studied prevalence included MD, NJ, PA, VA, WV, FL, GA, NC, SC, IL, MI, OH, WI, AL, TN, NE, MO, AR, LA, OK, TX, AZ, NV, UT, and WY. Except for donor prevalence in obesity+hypertension/diabetes, most of the states had increasing trend in the studied prevalence. NASH demonstrated an increased trend as the primary diagnosis for LT in all states, except for RI, VT, DC, NY (p=0.0635), SD, MT, NM, and OR (p=0.0516).
Conclusions: The prevalence of NASH as the primary diagnosis for LT has increased significantly from 2001-2017 in almost all states (from 7 to 90 per 10 million state population). The prevalence of predisposing comorbidities has also increased in the general population including deceased donors. We found that these trends were correlated/aligned.

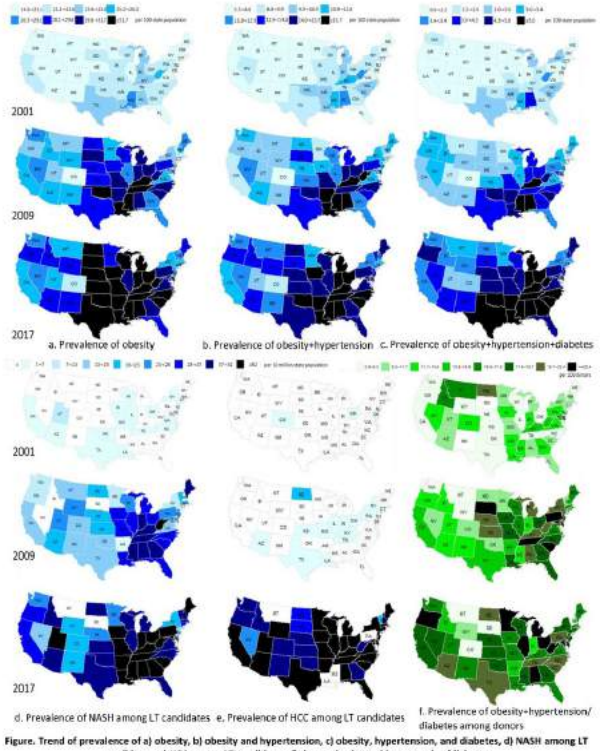

Figure. Trend of prevalence of a) obesity, b) obesity and hypertension, c) obesity, hypertension, and diabetes, d) NASH among LT candidates, e) HCC among LT candidates, f) donor obesity and hypertension/diabetes

Abstract# 185

Liver Transplant Justified at Any Meld Score?

H. Oden-Brunson, E. Godfrey, H. Flores, A. Rana, *Baylor College of Medicine, Houston, TX*

Purpose: Assessing the survival benefit of transplantation in patients with chronic liver failure is critical in guiding the decision-making process for liver allocation. Current protocols prioritize patients for transplantation by severity of illness as reflected by higher Model for End-Stage Liver Disease (MELD) scores. Previous guidance in the field has been to avoid transplantation below a MELD of approximately 18, based on retrospective studies that demonstrated increased mortality risk for those transplanted below that score compared to candidates who remained on the waitlist. Given improved short-term outcomes of liver transplantation and a changing landscape of liver disease, we aimed to evaluate the survival benefit of liver transplantation at lower MELDs using intent-to treat analysis, with specific attention to the risk of transplant at low MELD scores.
Methods: This retrospective cohort study used the UNOS database to analyze 161,823 candidates who were waitlisted for liver transplantation between March 1, 2002 and December 31, 2017. Stratified MELD cohorts were used to compare patients who were transplanted in a MELD score group to those listed in the same MELD group (omitting any who were transplanted in the same MELD group as listing) and then followed in an intent-to-treat manner. Kaplan-Meier analysis and multivariable Cox proportional hazard regression analysis were used to compare mortality between the transplantation and intent-to-treat cohorts.
Results: While the survival benefit of transplantation does increase with increasing MELD scores, a survival benefit was shown for transplantation even at the lowest MELD scores. Most notably, those transplanted at a MELD between 6-11 showed a 10% reduction in mortality (HR = 0.90 [95% CI, 0.85-0.94]; $p < 0.001$), compared to the intent-to-treat cohort listed at this MELD. This mortality benefit increased to a 28% reduction for those transplanted at MELD between 12-14 (HR = 0.72 [95% CI, 0.68-0.75]; $p < 0.001$) and a 38% reduction for those transplanted at a MELD between 14-17 (HR = 0.62 [95% CI, 0.59-0.65]; $p < 0.001$).
Conclusions: These findings challenge the current practice of deferring liver transplant below a particular MELD score such as 18, even if a possible match is offered, by showing a survival benefit for transplant patients even at the lowest

MELD scores. Further analysis into the justification of transplantation at any MELD score could have strong implications in the allocation and management of patients waitlisted for liver transplant.

Abstract# 186

Impact of Graft Quality on Patient Survival in Sick Patients

G. Handing[1], S. Keeling[1], C. Christmann[1], N. Galvan[2], C. O'Mahony[2], J. Goss[2], R. Cotton[2], A. Rana[2], *[1]School of Medicine, Baylor College of Medicine, Houston, TX, [2]Michael E DeBakey Department of Surgery, Division of Abdominal Transplant, Houston, TX*

Purpose: It is widely accepted in the literature that patients who have a Model for End Stage Liver Disease (MELD) Score greater than 30 incur an increased survival benefit from transplantation, regardless of allograft quality, compared to patients remaining on the waitlist. While immediate transplantation with any available organ is preferential from the patient perspective, it is also important to consider allograft allocation from a societal perspective—in which case population level survival should be maximized.

Methods: Using the Organ Procurement and Transplantation Network database, we retrospectively analyzed one-year patient survival in 7910 patients with MELD scores greater than 35. The impact of low- and high-quality allografts—quality determined by the donor risk index—was measured by adjusting for recipient risk factors in a multivariate analysis. The impact of graft quality on length of post-transplant hospital stay and graft survival were computed as well.

Results: High quality organs were associated with 60% increased patient survival (odds ratio [OR] 0.752, p=0.006) at 1 year post-transplant compared to low quality organs (OR 1.352, p=0.001) in patients with high MELD scores. Low quality organs were also associated with increased post-transplant hospital stays and decreased graft survival.

Conclusions: Although high risk patients experience significant survival benefit even with low quality organs, our analysis shows that selecting for high quality organs in this population is associated with better transplantation outcomes overall. Thus, there may be room for improvement in our current allocation system.

Abstract# 187

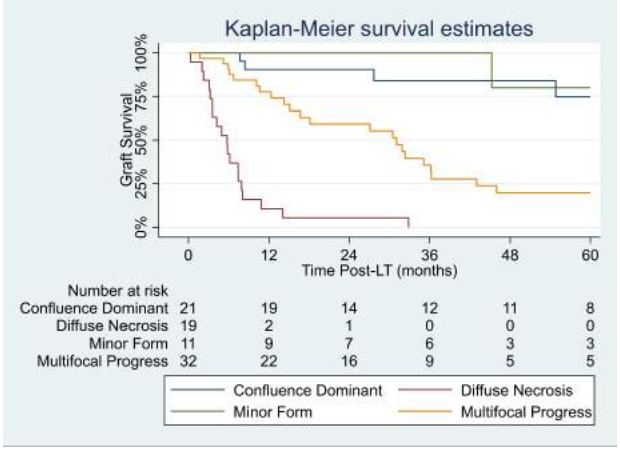
Classification of Distinct Patterns of Ischemic Cholangiopathy Following DCD Liver Transplantation: Distinct Clinical Courses and Long-Term Outcomes from a Multicenter Cohort

K. P. Croome[1], A. K. Mathur[2], B. Aqel[2], L. Yang[1], J. K. Heimbach[3], T. Taner[3], C. B. Rosen[3], R. Paz-Fumagalli[1], C. Taner[1], *[1]Mayo Clinic Jacksonville, Jacksonville, FL, [2]Mayo Clinic Arizona, Scottsdale, AZ, [3]Mayo Clinic Rochester, Rochester, MN*

Purpose: As the number of donation after circulatory death (DCD) liver transplants (LTs) performed in the United States continues to increase annually, there has been interest to develop a more robust exception point safety net for patients who develop ischemic cholangiopathy(IC) following DCD LT. As such, there is a need for better understanding of the clinical course and long-term outcomes in patients who develop IC, as well as determining if IC can be classified into distinct categories with distinctly different clinical outcomes.

Methods: All DCD LT (N=770) performed at Mayo Clinic-Florida, Mayo Clinic-Arizona and Mayo Clinic-Rochester from 1/1/1999-3/30/2020 were included. Clinical course and outcomes were investigated for the overall cohort of patients developing IC, as well as compared between four distinct radiologic patterns of IC: Diffuse Necrosis (DN), Multifocal Progressive (MP), Confluence Dominant (CD) and Minor Form(MF).

Results: A total of N=83 (10.8%) patients developed IC, of which N=41 (5.5%) were ultimately listed for retransplantation (ReLT). Patient survival following ReLT for IC was 88.4%, 79.0% and 72.4% at 1-, 3- and 5-years, respectively. Patients with DN and MP patterns suffered from frequent hospital admissions for cholangitis in the first year following DCD LT (median 3 and 2), were largely stent dependent (100% and 85.7%) and almost universally required ReLT. Patients with CD disease were managed with multiple stents and frequently recovered, ultimately becoming stent free without need for ReLT. Patients with the MF of IC did well with limited need for stent placement or repeat procedures and did not require ReLT. Graft survival was significantly different between the 4 distinct IC patterns (p<0.001).



Conclusions: The present analysis provides the largest and most detailed analysis to date on the natural history and clinical course of IC. IC development appears as a spectrum of damage in the bile ducts rather than an all or none phenomenon. Patients developing IC can be classified into 4 distinct patterns with distinct clinical courses.

Abstract# 188

The Unintended Financial Consequences of Acuity Circles for Liver Allocation - Two-fold Increase in Import Fees and Higher Organ Acquisition Cost Despite Unchanged Travel Patterns

A. Wall, S. Asrani, G. McKenna, E. Martinez, R. Ruiz, H. Fernandez, J. Bayer, A. Gupta, N. Onaca, R. Goldstein, J. Trotter, G. Testa, *Abdominal Transplant Surgery, Baylor University Medical Center, Dallas, TX*

Purpose: The recent initiation of acuity circles (AC) as the basis for liver allocation is associated with broader sharing and potentially greater travel and increased costs for organ acquisition. We compare liver acquisition costs before and after AC-based liver allocation.

Methods: We collected the OPO and flight invoices for all liver donors for our transplant center pre-AC (7/1/2019-2/3/2020) and post-AC (2/4/2020-10/30/2020).

Results: (Figure A) Comparing expenses from the post-AC to pre-AC period, there was a **>2-fold**increase both in % donors incurring an import fee (31.4% vs 12.6%, p<0.01), and surgeon fee (17.8% vs 7.4% p<0.01). Costs were significantly higher in the post-AC period compared to pre-AC, as total cost per accepted donor increased **16%**(mean $52,966 vs $45,725, p<0.01), cost per declined donor increased **55%**(mean $15,865 vs 10,217, p<0.01) acquisition fees increased **10%**(mean $39,979 vs 43,860, p<0.01) and flight expenses increased **43%**(mean $12,903 vs $9,048 p<0.01). The donor charges themselves varied widely. The highest and lowest donor costs for separate donors at the exact same donor city 200 NM from our center, differed by >$20,000 (Figure B)

Comparing donor parameters in the post-AC to the pre-AC period, there was no change in the Median MELD Score (24 vs 25, p=0.271) or match run sequence (15 vs 10, p=0.305), although the DCD acceptance rate was significantly higher (46% vs 29%, p=0.016).

Comparing travel patterns, there was no difference in median nautical miles travelled (146 vs 144, p=0.324) or percent of donors requiring flights (58% vs 57%, p = 0.8). There was no difference in the donor acceptance rate and most donors were within 150 NM.

Conclusions: Post-AC, our center had a higher % of donors incurring an import fee of $10,000, and surgeons fee ranging from $2,500-$4,000, as well as increased total costs for accepted donors (+16%), declined donors (+55%), acquisition fees (+10%) and flight fees (+43%). The unintended consequences of these ballooning costs of liver allocation needs urgent regulation by UNOS/OPTN in a similar vein to kidney acquisition, so as to ensure this change in AC allocation doesn't threaten the financial viability of liver transplant programs.

Lung

When Opportunity Knocks... Identifying Interventions to Optimize Lung Transplant Outcomes

Abstract# 189

Pregnancy Outcomes in 39 Lung Transplant Recipients

S. Constantinescu[1], L. A. Coscia[2], A. Yusuf[2], S. Rao[3], M. J. Moritz[4], *[1]Lewis Katz School of Medicine at Temple University, Philadelphia, PA, [2]Transplant Pregnancy Registry International, Philadelphia, PA, [3]University of Virginia Heath System, Charlottesville, VA, [4]Lehigh Valley Health Network, Allentown, PA*

Purpose: The purpose of this study is to describe 52 pregnancies in 39 lung transplant recipients reporting to the Transplant Pregnancy Registry International (TPRI) from 1992-2019; 3 recipients are from outside of North America.

Methods: Data were collected via questionnaires, telephone interviews, and medical records review.

Results: Cystic fibrosis was the indication for transplant in 22 (56%) of the women. The mean age at transplant was 27.5 ± 4.9 yrs and the transplant to conception interval was 4.0 ± 2.9 yrs (range 0.11-11.3 yrs). Only 41% of the pregnancies were reported as being planned. Most of recipients were on calcineurin inhibitor therapy for immunosuppression; 20% on cyclosporine and 78% on tacrolimus; 13% of pregnancies were exposed to a mycophenolic acid product (MPA) during the first trimester. Of the 54 pregnancies (including multiples) the outcomes were 33 live births, 15 miscarriages, 5 terminations, 0 stillbirths, and 1 ectopic pregnancy. There were 6 first trimester exposures to MPA resulting in 3 miscarriages, 2 live births (no birth defects) and 1 neonatal death due to prematurity (26 wks, also umbilical cord anomaly). Comorbid conditions during pregnancy included: hypertension 62%, rejection 14%, preeclampsia 12.5%, and diabetes requiring insulin 32%. Of the 33 livebirths the mean gestational age was 33.9 ± 4.8 wks and mean birthweight was 2151± 895 g. Neonatal deaths were reported in association with the triplet pregnancy: one fetus spontaneously aborted at 14 weeks, followed by the death of the two remaining infants delivered at 22 wks. There were 4 birth defects in 3 children. One child had both hypospadias (repaired at 8 mos) and cerebral arteriovenous malformation (corrected when discovered at age 18), one child had Tetralogy of Fallot, and one child had atrial and ventricular defects with pacemaker placement (mother had same diagnosis). There were 8 infants who were breastfed. The TPRI has been following the offspring long-term: mean age of the children 8.9 ± 8 yrs. With a mean maternal follow-up of 8.5 ± 7.3 yrs, 11 recipients have died (mean age of 6 children at maternal death 7.4 ± 5.7 yrs), 4 reported reduced function, and 24 had adequate transplant function.

Conclusions: Successful pregnancy is possible after lung transplantation, though caution is advised as these are extremely high-risk pregnancies with high incidences of graft rejection, prematurity, low birthweight infants. Close surveillance of these recipients is warranted due to the negative impact of rejection during pregnancy on graft and long-term maternal survival. All centers worldwide are encouraged to have their recipients report all pregnancies to the TPRI.

Abstract# 190

Guiding Therapeutic Plasma Exchange for Amr Treatment in Lung Transplant Recipients Using Serial Dilution in Single Antigen Bead Assay

O. A. Timofeeva[1], J. Choe[2], M. Alsammak[2], E. J. Yoon[2], S. Geier[2], K. Carney[2], J. Au[2], A. Diamond[2], J. A. Galli[2], K. Shenoy[2], A. Mamary[2], S. Seghal[2], P. Mullhal[2], Y. Toyoda[2], N. Shigemura[2], F. Cordova[2], G. Criner[2], J. Brown[2], *[1]MedStar Georgetown University Hospital, Washington, DC, [2]Temple University Hospital, Philadelphia, PA*

Purpose: Development of donor-specific antibodies (DSA) is associated with poor outcomes in lung transplantation. Patients who are presented with at least probable AMR require treatment; however, currently there are no guidelines on which treatment regiment to use. We investigated how DSA characteristics measured by Single antigen bead assay (SAB) such as antibody titers, C1q-binding, and mean fluorescence intensity (MFI) values in undiluted and diluted sera may be used to predict a response to therapeutic plasma exchange (TPE) and inform patient's prognosis after treatment.

Methods: Out of 357 consecutively transplanted patients without detectable pre-existing DSA between 01/01/16 and 12/31/18, 10 patients were identified treated with 5 sessions of TPE/IVIG. DSA characteristics were collected before and after treatment. The statistical analyses including log-linear regression, two-way ANOVA, and Kaplan-Meier survival were performed. All $P < 0.05$ were considered to indicate statistical significance.

Results: There was no significant difference in mean MFI, titers, or C1q-binding after treatment, suggesting that single-modality TPE treatment was not always effective. Also, there was no significant difference in titers and MFI or response to treatment between early and late DSAs. When post-treatment MFI were expressed as a percentage of pre-treatment levels and divided into 3 groups as responders (MFI levels decreased by more than 70%), partial responders (MFI decreased by 30-70%), and non-responders (MFI decreased by less than 30%), Kaplan-Meier Survival analyses showed a statistically significant difference between responders vs. partial responders and vs. non-responders (p= 0.0127). Linear regression test and Kaplan-Meyer survival analyses showed that percent of MFI reduction in 1:16 diluted pre-TPE sera was predictive of a response to standard TPE treatment (Figure A) and patient survival (Figure B).

Conclusions: Our data suggest that effective AMR treatment improves patient survival. Using 1:16 dilution can help identify patients likely to respond to a standard protocol vs those who require a more aggressive treatment to help guide clinicians as to which patients would be expected to respond to standards protocol or require more aggressive treatment.

Abstract# 191

Renal Preservation with Belatacept-Based versus Everolimus-Based Immunosuppression in Lung Transplant Recipients

E. Sartain[1], K. Schoeppler[1], B. Crowther[1], J. Smith[2], A. Gray[2], *[1]University of Colorado Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, CO, [2]Department of Medicine, Division of Pulmonary Sciences and Critical Care, University of Colorado, Denver, CO*

Purpose: Renal dysfunction is one of the most common long-term complications among lung transplant recipients (LTRs). Calcineurin-inhibitor (CNI) nephrotoxicity is a recognized contributor to renal insufficiency. CNI-minimization strategies using belatacept (BELA) based immunosuppressive regimens have not been as established in LTRs as everolimus (EVR) based immunosuppressive regimens. We sought to compare the impact of these two CNI sparing strategies on renal function in LTRs.

Methods: This retrospective analysis compared LTRs on BELA to those on EVR between 1/2012 and 9/2020. Patients maintained on therapy at least 3 months were eligible for inclusion. Primary outcome was change in eGFR at 6 months. Secondary outcomes at 6 months included change in FEV1, biopsy-proven acute rejection (BPAR), cytomegalovirus infection, fungal infection, *de novo* donor-specific antibody formation, post-transplant diabetes mellitus, and change in triglyceride level.

Results: Seventy-three patients were analyzed (14 BELA, 59 EVR). CNI minimization was used in the majority of patients on BELA or EVR. Baseline characteristics were similar between BELA and EVR, including pre-transplant eGFR, diabetes mellitus, and hypertension as well as renal failure during transplant hospitalization (Table 1). Tacrolimus levels were significantly lower at 3 and 6 months in the EVR group. On average, both strategies were associated with numerical improvement in eGFR at 6 months (BELA +6 mL/min/1.73m^2 , p=0.11; EVR +3 mL/min/1.73m^2 , p=0.04). There was no significant difference when change in eGFR was compared between groups (p=0.62). Secondary outcomes were similar, however there was a trend toward increased triglyceride levels in the EVR cohort (Table 2).

Conclusions: To our knowledge, this is the first study to compare BELA and EVR as renal-sparing strategies among LTRs. A BELA-based strategy appears to result in similar renal effects to EVR, despite significantly higher tacrolimus levels, without increased risk of BPAR at 6 months. Larger studies with longer term follow up are needed to understand the impact on lung function, CLAD rates and infection risks with these two regimens.

Table 1. Baseline Characteristics

	Belatacept (n=14)	Everolimus (n=59)	P-value
Age, median (IQR), y	59 (57 - 62)	61 (54 - 64)	0.51

Abstract# 192

Elexacaftor/ivacaftor/tezacaftor in Lung Transplant Recipients: A Case Series

L. M. Potter[1], B. Vargas[2], S. M. Rotolo[1], C. McEwen[1], K. Tsui[1], *[1]University of Chicago Medicine, Chicago, IL, [2]Roosevelt University, Chicago, IL*

Purpose: Little data is published describing the safety or efficacy of elexacaftor/ivacaftor/tezacaftor in lung transplant recipients. Even though it is not expected to offer pulmonary benefits in lung transplant recipients with cystic fibrosis (CF), it may improve extrapulmonary manifestations.

Methods: This retrospective case series summarizes the clinical experience of 7 lung transplant recipients on elexacaftor/ivacaftor/tezacaftor therapy.

Results: Patients were 39 +/- 11 years old, 71% male, and 7.6 +/- 7 years post transplant when starting elexacaftor/ivacaftor/tezacaftor. After 211 +/- 89 days on therapy, 4 (57%) note improvement in at least one domain: 4 (47%) report improved GI symptoms, 2 (29%) report improvement in sinus symptoms, 2 (29%) had pancreatic enzyme dose reductions. Of the 5 patients with CF-related diabetes, 3 (40%) report improvement in diabetes control. Most patients required a tacrolimus dose reduction after starting elexacaftor/ivacaftor/tezacaftor. In order to maintain the same tacrolimus trough goal, doses were adjusted from 9.3 +/- 5.9 mg/day at baseline to 7.4 +/- 5.3 mg/day after dose titration was complete; this was an average 20% dose reduction. There were no cases of allograft rejection. With regard to drug-related side effects severe enough to warrant intervention, 2 (29%) experienced leukopenia and 1 (14%) experienced transaminitis. Of the two with leukopenia, one improved with dose adjustment to other medications whereas one required elexacaftor/ivacaftor/tezacaftor discontinuation. The discontinuation rate for any cause was 1 patient (14%).

Conclusions: In sum, elexacaftor/ivacaftor/tezacaftor may offer a benefit for management of the extrapulmonary manifestations of cystic fibrosis after lung transplantation. Enhanced monitoring for tacrolimus dose adjustments and drug-related side effects is warranted.

Abstract# 193

Use of Granulocyte Colony Stimulating Factor After Lung Transplantation is Not Associated with Increased Likelihood of Acute Cellular Rejection

S. Fredrick[1], C. Iasella[2], L. Sacha[3], R. Rivosecchi[3], M. Morrell[3], P. Sanchez[3], J. Pilewski[3], M. Snyder[3], J. McDyer[3], C. Moore[3], *[1]University of Rochester Medical Center, Rochester, NY, [2]University of Pittsburgh School of Pharmacy, Pittsburgh, PA, [3]University of Pittsburgh Medical Center, Pittsburgh, PA*

Purpose: The cause of neutropenia in lung transplant recipients is multifactorial, including medications, viral infections, and antecedent disease. Granulocyte colony-stimulating factor (G-CSF) is commonly used to treat neutropenia in this population. This study examines whether the use of G-CSF is independently associated with acute cellular rejection (ACR) in lung transplant recipients.

Methods: This was a matched cohort study of adult lung transplant recipients between January 2010 and October 2019. Patients who received G-CSF were matched 1:1 to those who did not based on transplant indication, age, and sex. The primary outcome was biopsy-proven ACR in the 6-month period after first G-CSF administration or from a matched post-transplant time point in the no G-CSF group. Variables with a p-value <0.2 were included with G-CSF in a multivariable logistic regression to assess their effect on likelihood of ACR. Secondary outcomes included time to first ACR, severity of ACR, chronic lung allograft dysfunction, survival, and infections.

Results: 212 patients were included in the final analysis (106 per group). Baseline characteristics were similar between groups, except there were more patients at high risk for cytomegalovirus (CMV) in the G-CSF group and more patients at low risk for CMV in the no G-CSF group. 50 (47.2%) patients in the G-CSF group experienced ACR in the first 6 months, compared to 37 (34.9%) in the no G-CSF group (p=0.070). Of those who experienced ACR, severity of ACR was similar between groups. Time to first rejection episode was shorter in the G-CSF group (p=0.049; figure 1). In a multivariable logistic regression analysis (table 1) with G-CSF use, male sex, transplant indication, CMV serostatus, type of induction, maintenance immunosuppression regimen, and use of valganciclovir/ganciclovir, use of G-CSF was not significantly associated with ACR at 6 months (OR (95% CI) 1.409 (0.772-2.571); p=0.264). Patients in the G-CSF group had a higher 1-year mortality rate and a higher incidence of EBV viremia and bacterial pneumonia. All other secondary outcomes were similar between groups.

Conclusions: In this study in lung transplant recipients, G-CSF was not independently associated with ACR at 6 months. Treatment of neutropenia is often multimodal, and careful consideration of G-CSF therapy and other medication adjustments is warranted.

Abstract# 194

Impact Analysis of Virtual Transplant Ambulatory Pharmacist During Covid-19

L. Park, G. Waldman, J. Kim, C. Rogers, J. Clark, *Massachusetts General Hospital, Boston, MA*

Purpose: During the COVID-19 pandemic, transplant centers were challenged to meet the demand for new telemedicine strategies. High-risk immunocompromised patients, such as lung transplant recipients (LTR) require close follow-up due to their medical complexity and need for frequent medication changes. The pandemic significantly limited the ability of lung transplant providers (LTP) to safely conduct face-to-face clinic visits. Transplant pharmacists, previously unable to provide medication management visits for all patients due to time and space restraints of clinic, were now able to conduct virtual telehealth visits to assist LTP in the transition to telemedicine.

Methods: A retrospective chart review of telephone encounters from cardiothoracic pharmacists (CTRx) at our center from March to September 2020 was completed. LTR scheduled for clinic visits with LTP were called prior to the visit by CTRx who conducted chart reviews, medication reconciliations, adherence assessments, and medication access assistance. Clinical recommendations were then communicated directly to the LTP and documented in patient electronic medical records. The primary outcome was the number of pharmacist-driven clinical interventions made during COVID-19 virtual lung transplant visits. Secondary endpoints included the total number of medication discrepancies, average number of interventions, and average number of discrepancies found per visit.

Results: From March to September 2020 the CTRx conducted 385 virtual visits on 157 LTR with an average of 23.4 minutes spent per visit. There were 864 total interventions made by CTRx and a total of 778 medication discrepancies identified. An average of 2.8 interventions were sent to LTP per visit. The most common interventions made were medication education (20.8%), adherence counseling (19.5%), update on adherence level (20.4%), and reinforcement of social distancing and COVID-19 precautions (17.1%). There was an average number of 2.5 medication discrepancies identified out from an average of 22.6 medications reconciled per visit. (Table 1)

Conclusions: Implementation of CTRx telehealth visits has potential for increased patient access to pharmacy care, improved accuracy of medication lists and increased collaboration with LTP given the flexibility that telemedicine provides. Further investigation is needed to determine the significance of CTRx clinical interventions on clinical patient outcomes.

Table 1. Results

Type of Medication Discrepancy, n (%)	
Medication discontinued by CTRx	299 (39)
Medication added by CTRx	188 (39)
Incorrect dose updated by CTRx	156 (20)
Other	135 (17)
Type of Intervention, n (%)	
Medication education	311 (21)
Report changes in medication adherence	305 (20)
Adherence counseling	291 (20)
Social distancing/COVID safety reinforcement	255 (17)
Report change in clinical status	70 (5)
Adverse event reporting	69 (5)
Change to pharmacologic therapy	65 (4)
Nonpharmacologic therapy recommendation	38 (3)
Renal dose adjustment	30 (2)
Recommend immunosuppressant adjustment	26 (2)
Cost savings intervention	23 (2)
Avoidance of drug-drug interaction	9 (1)

Abstract# 195

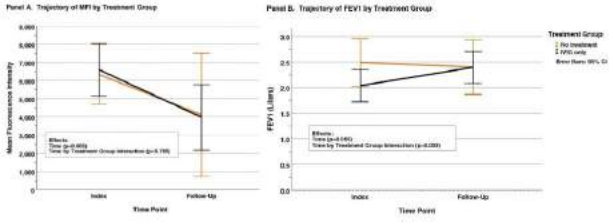
Outcomes of IVIG Monotherapy for Donor-Specific Antibodies After Lung Transplantation

K. Spence, S. Heeney, M. Morrison, S. A. Rega, F. D. Irene, K. B. Harrison, C. M. Shaver, *Vanderbilt University Medical Center, Nashville, TN*

Purpose: *De novo* donor-specific antibodies (DSA) are a risk factor for antibody mediated rejection (AMR) and poor clinical outcomes after lung transplant (LT). Intravenous immune globulin (IVIG) neutralizes circulating DSA and is thought to disrupt AMR. We tested the hypothesis that IVIG therapy is associated with reduced DSA intensity and increased FEV1 compared to observation alone.

Methods: LT recipients from 2009 to 2019 with *de novo* DSA with mean fluorescence intensity (MFI) >3000 were included in this retrospective, single-center, observational analysis. Subjects were excluded if they had treatment in addition to IVIG, had a positive crossmatch, had IVIG prior to DSA, or had no follow-up DSA in 28-100 days. Subjects received IVIG only (n=23) or did not receive treatment (n=16). The trajectories of DSA MFI and FEV1 between the index and follow-up DSA were each tested via repeated measures analysis of variance with time by treatment group interaction effects. Additional outcomes were chronic lung allograft dysfunction and survival. Between-group comparisons were made using parametric and non-parametric tests and Kaplan Meier survival methods.

Results: The study cohort included 39 LT patients (mean age 53±13y, 59% male, 80% double LT) with most having IPF (41%) or COPD (36%). The majority (85%) of DSAs targeted class II antigens. These baseline characteristics and the median interval between index and follow-up testing did not differ between groups (all p>0.203). While overall DSA MFI decreased over time (p=0.003), there was no significant difference in the trajectory of MFI between treatment groups (Panel A, p=0.789). In contrast, the trajectory of FEV1 increased over time in the IVIG group, but not in the no treatment group (Panel B, time by treatment interaction p=0.003). Mean FEV1 at DSA detection was 2.04±0.72 and 2.49±0.77 for the IVIG and no treatment groups, respectively (p=0.087). There was no between-group difference in CLAD (22% vs. 38%, p=0.307) or patient survival (log rank p=0.396).



Conclusions: Although patients treated with IVIG alone for *de novo* DSA after LT have similar DSA MFI trajectories over time, their FEV1 increased after therapy. This result may be due to the trend towards lower FEV1 in the IVIG group at the time of DSA detection. Future studies are needed to determine the mechanisms by which IVIG affects FEV1 in the setting of DSA.

Abstract# 196

Liver Dysfunction Following Lung Transplantation

E. J. Hyzny[1], E. G. Chan[1], J. P. Ryan[1], T. Harano[1], M. R. Morrell[2], P. G. Sanchez[1], *[1]Cardiothoracic Surgery, University of Pittsburgh School of Medicine, Pittsburgh, PA, [2]Pulmonary, Allergy and Critical Care Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA*

Purpose: To describe the incidence and risk factors for postoperative hepatic dysfunction (POHD) following lung transplantation (LT) and long-term outcomes for these patients.
Methods: We performed retrospective analysis of 1261 adult LT recipients performed at our center between 1/1/2007- 12/1/2019. Patients were excluded for re-do LT or concurrent solid organ transplantation. POHD was defined by ICD-9 code designation. Chi-square analysis was performed for categorical variables and Mann Whitney U tests for continuous variables. Survival curves were estimated using Kaplan-Meier and log-rank test analysis.
Results: Out of the 1,094 primary lung transplants included, 82 (8.1%) developed POHD following LT. Predictors of POHD included a preoperative history of cirrhosis or portal hypertension (OR:22.13 (CI:5.19-94.40), p<0.001). Right upper quadrant ultrasonography (RUQ-US), performed in 112 (10.3%) patients for high preoperative suspicion of liver disease, was a significant predictor for POHD (OR: 2.73 (CI:1.55-4.80), p<0.001). Transplant diagnoses associated with obtaining preoperative RUQ-US due to clinical suspicion of preoperative liver dysfunction include pulmonary hypertension (p<0.001) and cystic fibrosis (p=0.01). Evidence of fibrosis on RUQ-US conveyed additional risk for POHD (OR:2.76 (CI:1.11-6.86, p=0.03). Other risk factors included use of intraoperative mechanical support (OR: 2.65 (CI: 1.62-4.25), p<0.001) and delayed chest incision closure (OR: 3.73 (CI:2.34-5.92), p<0.001). POHD was associated with longer ICU stay overall (10.5 vs 5 days, p < 0.001), increased duration requiring mechanical ventilatory support (15 vs 2.71 days, p < 0.001), and higher post-operative mortality (HR:11.23 (CI:6.34-19.88), p<.0001). Developing POHD was also associated with significantly lower long-term survival at 3 (p<0.001) and 5 years (p<0.001)(Figure 1).
Conclusions: Following lung transplantation, hepatic dysfunction is a prevalent and morbid complication associated with high mortality. Additional studies are necessary to identify best treatment algorithm and practices to better avoid hepatic dysfunction in the postoperative setting following lung transplantation.

Abstract# 413

Early Outcome of Heart-Kidney Transplantation in the Current Heart Allocation System in the United States

S. Rao[1], A. Doyle[1], D. Brennan[2], S. Constantinescu[3], *[1]University of Virginia, Charlottesville, VA, [2]Johns Hopkins Medical Institute, Baltimore, MD, [3]Lewis Katz School of Medicine at Temple University, Philadelphia, PA*

Purpose: In the United States, heart allograft allocation is a primary determinant for heart-kidney transplantation (HKT). We analyzed the OPTN dataset and compared the outcomes of HKT performed under the prior heart allocation system (prior-HAS, October 1, 2015-October 18, 2018, n= 516) and the current-HAS which prioritized sicker patients (after October 18, 2018, n=149)).
Methods: We acquired de-identified data from the OPTN registry with follow up through December 6, 2019.Baseline demographics, comorbidities, etiology of cardiac and kidney dysfunction were collected. Pre-transplant cardiac support was assessed by inotropic and/or mechanical circulatory support (MCS). The kidney dysfunction pre-transplant was assessed by the serum creatinine at listing, the need for pre-transplant dialysis, and duration of dialysis (short ≤6 weeks, medium 7-12, long >12 weeks).
Results: Under the current-HAS, the percentage of HKT amongst the total heart transplants has increased to 6.4% from 5.3% (p=0.038). Although the prevalence of pre-transplant dialysis was similar (about 50%) amongst the groups, a higher percentage in the current-HAS group had a short duration (less than 6 weeks) of dialysis (24.5% vs 7.3%, p= 0.01). On univariate Cox-regression, the current-HAS group had lower 180-day survival (87.2% vs 92.4%, HR 1.75, 95%CI 1.01-3.04, p=0.04) and a trend towards lower kidney allograft survival (83.9% vs 85.9%, HR 1.60, 95%CI 0.09-2.59, p= 0.05). After adjusting for covariates, HAS era was not an independent predictors of outcomes. Delayed graft function of kidney allograft remained a strong predictor of poorer outcomes and was higher in the current-HAS group (35% vs 26%, p=0.03).
Conclusions: Our study shows that the rates of HKT have continued to increase under the current HAS. Similar to the higher mortality in heart transplant recipients under the current-HAS era, patient mortality was higher in the HKT recipients too. This study highlights the need for a novel HKT allocation policy with standardized listing and allocation criteria aimed to improve HKT outcomes.

Abstract# 414

Liver Simulated Allocation Model Does Not Accurately Predict Organ Offer Decisions in Pediatric Liver Transplant Candidates

N. L. Wood[1], D. B. Mogul[2], E. K. Hsu[3], E. R. Perito[4], G. V. Mazariegos[5], D. Vanderwerken[1], D. L. Segev[2], S. Gentry[1], *[1]US Naval Academy, Annapolis, MD, [2]Johns Hopkins, Baltimore, MD, [3]Univ of Washington, Seattle, WA, [4]UCSF, San Francisco, CA, [5]Univ of Pittsburgh, Pittsburgh, PA*

Purpose: The U.S. relies on the Scientific Registry of Transplant Recipient's (SRTR's) Liver Simulated Allocation Model (LSAM) to predict the effect of allocation policy changes on liver transplant (LT) outcomes. To effectively inform policy changes, LSAM's model must accurately predict liver offer accept/decline decisions for candidates in general--and for vulnerable subgroups in particular. We hypothesized that liver offer decisions for children differ fundamentally from adults, and thus that LSAM may not accurately model accept/decline decisions for children.

Methods: SRTR data on all deceased donor liver offers from 07/01/2013-06/30/2016 were compared to LSAM's model predictions on accept/decline decisions for these LT candidates, to evaluate LSAM predictions in pediatric (listing age <18yrs) vs. adult candidates (≥18yrs). 0.5% of all offers excluded for missing data. Performance of LSAM's two models, for Status 1A candidates and for non-1A candidates, was evaluated by age group using area under the receiver operator characteristic curves (AUC).

Results: Of 39,351 offers to pediatric candidates and 894,221 to adults during the analysis period, 95.4% and 99.6% respectively were to non-1A candidates; 2.9% of these offers to children and 1.8% of offers to adults were accepted for LT. Among Status 1A candidates (1,829 children, 3,833 adults), 11.7% and 14.8% of offers were accepted respectively. Among non-1A candidates, LSAM's prediction of waitlist mortality was substantially worse for pediatric candidates than for adults (AUC 0.814, 0.922 respectively, FIGURE). Stratifying children by age demonstrates that LSAM performed comparably for teenagers (12-17yrs, AUC 0.922) and adults (≥18yrs, AUC 0.898) but much worse for children (2-11yrs, AUC 0.807) and infants (<2yrs, AUC 0.781). For the smaller group of Status 1A candidates, AUC was lower for all age groups but again the lowest for infants (0.618), followed by children (0.747); AUC for teenagers (0.712) was comparable to that of adults (0.779).

Conclusions: LSAM does not accurately predict liver offer accept/decline decisions for pediatric liver transplant candidates. Predictions are least accurate for the youngest children. To truly predict the impact of allocation policy changes on children, for liver and all solid organ transplants, SAM models specific to pediatrics should be derived and utilized.

Abstract# 415

Impact of Covid-19 in Transplant Care: Attitudes, Feeling and Behaviors of Liver, and Kidney Pre and Post Transplant Patients

J. Ramos-Ayes, *Beth Israel Deaconess Medical Center, Boston, MA*

Purpose: The SARS-CoV-2(COVID-19) pandemic poses unique challenges for transplant patients, which may impact their attitudes, emotions and behaviors associated with transplant care. This study surveys liver and kidney transplant patients about the COVID-19 pandemic's impact on their transplant care.

Methods: Method: We evaluated the attitudes, feelings and behaviors about their healthcare associated to COVID-19 in 123 pre and post liver and kidney transplant patients (34.4% pre-kidney, 10.7% pre-liver, 33.6% post-kidney, and 18.9% post liver) in the New England area, for the month of July 2020. Data collection (email), entry and validation were facilitated via REDCap and statistical analysis using the Statistical Package for the Social Sciences (SPSS; Chicago, Illinois).

Results: Most patients (89.5%) feel confident in their ability to understand information about COVID-19. 25.4% were tested for COVID-19, with 2 positives (6.5%). The majority of the patients adhered to the CDC guidelines to prevent COVID19 infection in regards to hand washing (often 29.4%; all the time (68.3%), social distancing (often 38.2%; all the time 58.5%), and wearing mask (often 7.3%; all the time 87.0%). Most patients were able to obtain their medication when needed and are getting their surveyance labs at the same schedule than before the pandemic. Most are not worried about COVID-19 infection doing labs (62.6%), however, most of them are concern about getting COVID-19 if they need to be admitted to the hospital (63.7%) and 30% will consider not going to the hospital. Most patients express some level of concern about other people not considering organ donation because of COVID-19 (55.6%), however, most will accept a deceased donor transplant if available (94.6%). Most of the patients showed a normal distress level (72%), 19.8% reported a mild distress, and 7.9% reported a severe distress.

Conclusions: Most patients reported appropriate adherence to prevent infection, appropriate transplant-related self-care, and capacity to psychologically adapt to the COVID-19 pandemic. The potential impact of the virus in those patients who are struggling with transplant care due to the pandemic is still an area of concern for transplant centers and relevant to clinical and operational initiatives that aims to mitigate the risk of COVID-19 infection among transplant patients.

Abstract# 416

Influence of Frailty on Psychometric Factors and Health-related Quality of Life in Patients on the Waitlist for Liver Transplantation

C. G. Klein, J. Latuske, E. Malamutmann, A. Paul, A. Oezcelik, *University Medicine Essen, Essen, Germany*

Purpose: The aim of this prospective study was to evaluate the influence of frailty on depression, anxiety and health-related quality of life for patients on the waitlist for liver transplantation.

Methods: Between September 2015 and November 2019 all patients listed for liver transplantation were included to the study. Fried Frailty criteria were assessed. Validated standard questionnaires/tests were used for the assessment of depression, anxiety and health related quality of life. All tests were repeated every six months and 12 months after transplantation. Prä-, intra and postoperative data were reported, as well

Results: Total of 114 patients in median age of 53 years were included to the study. Non-frail were 27 patients (23.7%), pre-frail 58 patients (50.9%) und frail 29 patients (25.4%). The comparison of the psychometric factors between the three groups has shown, that anxiety and depression was seen significantly more often in pre-frail or frail patients ($p< 0.001$). The health-related quality of life was significantly better in none-frail patients ($p< 0.001$). During this timeframe 62 patients (54.4%) underwent liver transplantation. Number of pre-frail and frail patients with depression was postoperatively decreased but not significantly. Number of patients with anxiety was significantly decreased after LT. The health related quality of life has not changed 6 months after LT. There was no significant correlation between frailty and psychometric factors postoperatively.

Conclusions: Rate of depression and anxiety is significantly higher in frail patients on waitlist for liver transplantation. Psychological support/treatment of these patients on waitlist seems to be useful. Although patients need more than 6 months after transplantation for recovery of life qualitity and depression, however anxiety improves right after successfull liver transplantation.

Abstract# 417

Psychosocial Factors Influencing Patients' Decision Making About Upper Extremity Vca

B. Kuramitsu[1], J. Gacki-Smith[1], A. Ferzola[2], K. Vanterpool[2], C. Kunkle[3], M. Hewitt[3], A. Schultheis[3], T. Riggleman[3], J. Taylor[3], C. Cooney[2], M. Levan[2], S. Tintle[3], G. Brandacher[2], E. Gordon[1], *[1]Northwestern University, Chicago, IL, [2]Johns Hopkins University, Baltimore, MD, [3]Walter Reed National Military Medical Center, Bethesda, MD*

Purpose: The informed consent process for upper extremity (UE) Vascularized Composite Allotransplantation (VCA) has yet to be standardized. Consequently, the information provided to patients about UE VCA varies. Such variation may contribute to people with UE amputations being inadequately informed and under-prepared for decision making about UE VCA. This study examined decision making and psychosocial factors affecting decisions about UE VCA among people with UE amputations.

Methods: We conducted in-depth interviews among people with acquired UE amputations. Open-ended questions assessed psychosocial factors informing decision making about UE VCA. Thematic analysis was used to analyze qualitative data.

Results: To date, 12 people completed in-depth interviews (75% participation rate). Most were male (71%) and had a mean age of 49 years. Most had a unilateral amputation (75%) and had undergone amputation a mean of 8 years earlier. Forty-two percent of participants were 'completely' or 'a lot' willing to pursue VCA. Psychosocial factors influencing decisions to pursue VCA included: expecting an increase in social and physical confidence; seeking independence with activities of daily living; enabling more active involvement as a parent; family or friend enthusiasm; and prosthetic device problems. Psychosocial factors influencing decision making not to pursue VCA included: feeling mentally unprepared for a transplant; having already adapted to life without upper limb(s); concerns about the long-term commitment to taking immunosuppressants; discouragement from family or friends; concerns about the rigorous rehabilitation process; concerns about receiving a graft that appears mismatched in size or skin color; concerns that the transplant may be unsuccessful; concerns about health or limb function becoming "worse off" from the UE VCA; and concerns about logistical barriers to accessing transplant and rehabilitation services.
Conclusions: Preliminary findings suggest that people with UE amputations hold concerns that diminish their enthusiasm for UE VCA. Addressing patients' psychosocial concerns may foster informed decision making about UE VCA.

Abstract# 418

Higher Number of Tacrolimus Dose Adjustments and Trough Level Measurements in Kidney Transplant Recipients with CYP3A5*1 Alleles

K. Reininger[1], G. Onyeaghala[2], T. Anderson-Haag[1], B. Wu[2], W. Guan[2], C. R. Dorr[2], R. Remmel[2], R. Mannon[3], A. Matas[2], W. Oetting[2], A. Israni[1], P. Stahler[1], P. Jacobson[2], *[1]Hennepin County Medical Center, Minneapolis, MN, [2]University of Minnesota, Minneapolis, MN, [3]University of Nebraska Medical Center, Omaha, NE*

Purpose: Tacrolimus (TAC) metabolism is dependent on the functional status of the cytochrome P450 family enzyme CYP3A5 which has three common loss of function (LoF) genetic alleles *3, *6, and *7. Presence of the functional CYP3A5*1 allele has been linked to increased tacrolimus dose, risk of rejection and graft loss. We hypothesized that patients with one or two CYP3A5*1 alleles would require a greater number of TAC dose adjustments and troughs measured relative to patients without a *1 allele.
Methods: This was a retrospective review of kidney transplant recipients from a single center participating in the GEN03 study with available genotype data for CYP3A5 *1 *3, *6, and *7 and at least 6 months of TAC information. The primary endpoints were number of TAC dosage adjustments and trough levels measured in the first six months, and data were analyzed using quasi-likelihood based Poisson regression. Secondary endpoints included incidence of biopsy proven acute rejection (BPAR) and estimated glomerular filtration rate (eGFR) at 1, 3, and 6 months post-transplant.
Results: 78 patients had available CYP3A5 genotype data and were included. Fifty-five patients were CYP3A5 poor metabolizers (PM, carriers of two LoF alleles), 17 were intermediate metabolizers (IM, carriers of one LoF allele), and 6 were extensive metabolizers (EM, no LoF alleles). Compared to PMs, EMs were more likely to require more trough measurements and dosage adjustments, RR 1.2 [95% CI 1.00-1.44] and RR 1.53 [95% CI 1.11-2.11] respectively. No differences in number of troughs or dosage adjustments were observed between PMs and IMs. Incidence of BPAR was low with 1 PM and 1 EM experiencing rejection. At 6 months, mean (SD) eGFR in mL/min/1.73m^2 was 60.5 (20.3) for PMs, 64.1 (16.7) for IMs, and 43.8 (13.5) for EMs. PMs had significantly higher eGFR than EMs ($p = 0.047$).
Conclusions: CYP3A5 EMs required more dose adjustments and additional trough measurements relative to PMs. Although changes in graft outcomes were not different among the metabolizer groups, the frequency of the events was low. Further research is warranted to investigate whether initial TAC dosing optimized based on CYP3A5 genotypes would reduce cost of care, result in better goal attainment, and improve time to the therapeutic range.

CYP3A5 Phenotype	White	Black or African American	Asian	American Indian or Alaska Native	Other	Mean Number of Troughs/Dose Adjustments (95% CI)	Relative Risk (95% CI)	p-value
Number of Troughs								
Poor Metabolizer	44	4	3	2	2	19.5 (18.3 – 20.7)	Reference	
Intermediate Metabolizer	6	6	4	1	0	18.9 (16.9 – 21.1)	0.96 (0.84 – 1.09)	0.545
Extensive Metabolizer	0	3	2	0	1	24.0 (20.3 – 28.3)	1.20 (1.00 – 1.44)	0.0493
Number of Dose Adjustments

Abstract# 419

The Impact of De Novo Dose-Adjustment Strategies with Tacrolimus XR (LCP-Tac) in Kidney Transplant Recipients

T. Carcella, F. Bartlett, N. Patel, V. Rohan, D. Taber, *Medical University of South Carolina, Charleston, SC*

Purpose: LCP-Tac is a once daily formulation of tacrolimus indicated for the prophylaxis of rejection in de novo kidney transplant recipients. It provides less variable bioavailability, but high intra- and inter-patient variability remain a challenge. We sought to determine the impact of baseline characteristics and dose-adjustment strategies on achieving target levels of LCP-Tac in adult kidney transplant recipients.
Methods: This was a retrospective longitudinal study of adult kidney recipients transplanted between May and September 2020 who received de novo LCP-Tac. The primary endpoint was time to first therapeutic level (7-12 ng/mL). Secondary endpoints included time to stable level and time in therapeutic range (TTR) in the first month. Categorical data were analyzed with chi square or fisher's exact. Continuous data were assessed using one-way ANOVA. Multivariable linear regression analysis of the primary endpoint included variables that were statistically associated in univariable analyses.
Results: A total of 122 patients were included. Median time to first therapeutic level was 5 days. We assessed baseline and peri-operative factors; none of which impacted the primary endpoint (Table 1). Median time to stable level was 13 days. Eighteen patients never achieved a stable level during 1-month follow-up. TTR in the first month was 65% ± 22%. In the multivariable analysis, over-conservative dose adjustments significantly impacted TTR; for every dose adjustment ≥ 20% lower than expected using linear kinetics, the TTR decreased by 6.3% (95% CI 3.5% to 9.1%; $p<0.01$).
Conclusions: Most patients given de novo LCP-Tac achieve a therapeutic level in the first week post-transplant, which does not appear to be influenced by baseline or post-op characteristics. TTR was significantly impacted by the number of dose adjustments lower than expected. This study emphasizes the importance of avoiding under-adjusting doses early after transplant with de novo LCP-Tac use.

Factor	B (95% CI)	P-value
Initial mg/kg dose	-29.74 (-63.67 – 4.19)	0.09
Waitlist time	0.43 (0.01 – 0.86)	0.04

Abstract# 420

Managing the Significant Drug-Drug Interaction Between Tacrolimus and Letermovir in Solid Organ Transplant Recipients

J. Hedvat, J. Choe, D. Salerno, J. Scheffert, D. Bley, A. Anamisis, T. Shertel, J. Lee, E. Liu, N. W. Lange, *NewYork-Presbyterian Hospital, New York, NY*

Purpose: Letermovir does not appear to share cross-resistance with ganciclovir and is not associated with nephrotoxicity or myelosuppressive effects, making it an attractive option for management of cytomegalovirus in solid organ transplant (SOT) recipients. Letermovir is a moderate inhibitor of cytochrome P450 3A4 and may lead to increased serum concentrations of tacrolimus. We conducted this study to assess the magnitude of this drug-drug interaction in clinical practice among SOT recipients receiving either immediate-release (IR) or extended-release (XR) tacrolimus upon starting letermovir therapy.

Methods: This was an IRB-approved, single-center retrospective study of adult SOT recipients receiving IR or XR tacrolimus who began letermovir therapy (480 mg or 720 mg once daily) between January 2018 and July 2020. Patients were excluded if they were on concomitant medications that are known to interact with tacrolimus. Tacrolimus dose and trough concentrations were collected for 30 days before and after the initiation of letermovir. The primary outcome was normalized IR and XR tacrolimus dose requirements with and without concomitant letermovir therapy. Linear interpolation was used to estimate tacrolimus trough concentrations if a dose adjustment was not made on the same date that the trough was obtained. Sign-test was used to compare differences in weight-based dose and dose-corrected trough concentrations within the same patient while on/off letermovir.

Results: A total of 14 SOT recipients were identified. Median patient age was 57 (IQR 44 - 68) years and 57% of patients were kidney transplant recipients. Patients were predominantly white (43%) and male (79%). Patients began treatment with letermovir at a median time of 263 (135 - 443) days post-transplant. Most patients received letermovir 480 mg once daily (57%). Median weight-based tacrolimus dose when used without letermovir was 0.09 (0.04 - 0.14) versus 0.05 (0.03 - 0.11) mg/kg/day when used concomitantly with letermovir, P=0.016 (Figure 1A). Dose-corrected trough concentrations of tacrolimus without letermovir was 1.54 (1.15 - 2.77) versus 2.16 (1.31 - 3.16) ng/mL/mg when used concomitantly with letermovir, P=0.013 (Figure 1B).

Conclusions: An approximate tacrolimus dose reduction of 30% may be warranted when initiating letermovir to achieve a comparable dose-corrected trough concentration. Regardless of empiric adjustment, we recommend repeating a tacrolimus trough concentration within 5-7 days after starting letermovir.

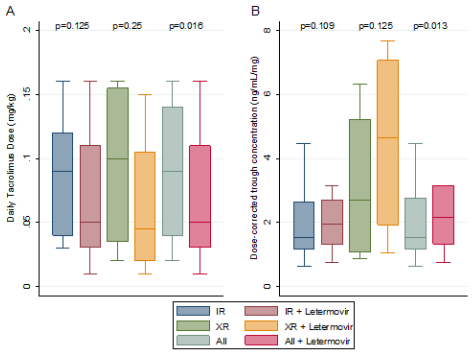

Figure 1.

A) Total daily tacrolimus dose (mg/kg) and B) dose-corrected trough concentration (ng/mL/mg) for patients with and without letermovir.

Abstract# 421

Tacrolimus Therapeutic Exposure is Not Consistently Predicted by Target Troughs or CYP3A5 Variants in Stable Renal Transplant Recipients

K. Tornatore[1], K. Attwood[2], D. Brazeau[3], B. Murray[4], *[1]Pharmacy Practice, School of Pharmacy; University at Buffalo, Buffalo, NY, [2]Biostatistics, School of Public Health; University at Buffalo, Buffalo, NY, [3]Pharmacy Practice, School of Pharmacy; Marshall University, Huntington, WV, [4]Medicine, Erie County Medical Center Corp., Buffalo, NY*

Purpose: Tacrolimus (TAC) immunosuppression requires therapeutic trough monitoring post-transplant due to notable interpatient pharmacokinetic(PK) variability which may be attributed to CYP3A5 polymorphisms. We investigated the relationship of therapeutic tacrolimus troughs to the corresponding drug exposure with CYP3A5 variants in stable renal transplant recipients(RTR) on long-term immunosuppression.

Methods: The relationship between tacrolimus troughs(target: 4-12ng/ml) and Area Under the Concentration Time Curve 0-12 hours (AUC 0-12hr) with target exposure of 120 to 200 ng▪hr/ml, and CYP3A5 variants was investigated in 65 stable RTR treated with maintenance immunosuppression of immediate release tacrolimus and mycophenolic acid. A prospective study collected 12-hour serial samples for determination of steady-state tacrolimus PK including: AUC 0-12hr, 12hr troughs(C-12hr) and clearance(CL). The C-12hr were achieved using therapeutic drug monitoring. The CYP3A5 polymorphisms: *3[rs776746],*6[10264272],*7[41303343], associated with loss of protein function, were characterized. RTR were classified as Extensive, Intermediate and Poor metabolizers using the CYP3A5*3*6*7 metabolic composites based on functional genotypes and analyzed with tacrolimus PK using SAS V 9.4.

Results: The table below summarizes the RTR according to AUC 0-12hr greater than 120 ng▪hr/ml and less than 120 ng▪hr/ml. The combined groups had mean eGFR: 55.8 (15.5) ml/min/1.73m2 and time post-transplant: 3.0(2.6) years. Therapeutic troughs of 4-12ng/ml were achieved in 98.5% of RTR with 53.9% of recipients within the therapeutic AUC 0-12hr and 44.6% below the therapeutic exposure (P < <0.001). No difference in CL between groups was noted. No association of CYP3A5*3*6*7 composite was found within or below AUC 0-12 range.

Conclusions: Although stable RTR achieved the trough targets using therapeutic drug monitoring, approximately 45% of these recipients were below the recommended tacrolimus AUC 0-12hr. The composite CYP3A5*3*6*7 variants demonstrated no predictive associations toward achieving the therapeutic target exposure.

Tacrolimus Pharmacokinetics and CYP3A5 Variants			
+=Mean(SD); #: N(%Freq)	Less than 120 AUC 0-12hr [N=30]	Greater or equal to 120 AUC 0-12hr [N=35]	P Value

Kidney

Kidney Deceased Donor Allocation 2

Abstract# 422

The Impact of Combined Warm and Cold Ischemia Times on Post Transplant Outcomes

M. E. Foley[1], A. J. Vinson[2], K. K. Tennankore[2], *[1]Faculty of Medicine, Dalhousie University, Halifax, NS, Canada, [2]Division of Nephrology, Medicine, Dalhousie University/ Nova Scotia Health, Halifax, NS, Canada*

Purpose: Both prolonged warm ischemia time (WIT) and cold ischemia time (CIT) have been associated with an increased risk of graft failure following kidney transplantation, however their combined impact has yet to be studied. In this analysis of United States kidney transplant recipients, we explored the additive effect of prolonged WIT and CIT on the risk of death or graft failure following kidney transplantation.

Methods: The Scientific Registry of Transplant Recipients was used to identify renal transplant patients who underwent deceased donor kidney transplantation between 2005 and 2014. We included only those with complete data for WIT and CIT and excluded extremes of both exposures (WIT<10 minutes or >120 minutes, CIT<1 hour or >24 hours). The outcomes of death/graft failure were captured until September 1, 2017. WIT and CIT were separately categorized using linear splines to determine cut points. WIT and CIT were classified as short, medium and long (0-40 min, 40-80 min, >80 min respectively for WIT; 1-8.7 hrs, 8.7-16.3 hrs, >16.3 hrs respectively for CIT). A combined WIT-CIT variable included all WIT-CIT combinations, with the reference group being short WIT-short CIT (0-40 min WIT, 1-8.7 hrs CIT). Multivariable cox proportional hazard models were used to determine the association of combined WIT-CIT on the composite outcome of death or graft failure.

Results: A total of 54, 745 deceased donor kidney transplant recipients had complete data for WIT and CIT. Median WIT and CIT were 35 (IQR 18) minutes and 14.5 (IQR 8.8) hours, respectively. There was an incremental increase in the risk of death/graft loss for categories of CIT and WIT. Adjusted hazard ratios for death or graft failure increased across combined WIT-CIT groupings relative to reference patients, with the highest risk of an event being in the setting of combined long WIT-long CIT (HR 1.24, 95% CI 1.05-1.47), Figure 1.

Conclusions: Prolonged WIT-CIT was associated with an increased risk of the composite outcome of death or graft failure in a small but graded manner. Attempts should be made to minimize both CIT and WIT in order to optimize post-transplant outcomes.

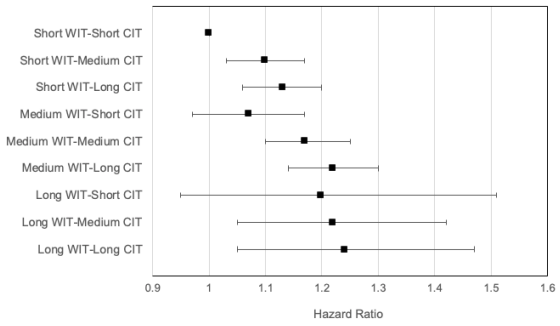

Figure 1. Combined Warm Ischemia Time and Cold Ischemia Time and the Risk of Death or Graft Failure; Adjusted for recipient sex, recipient race, recipient weight, recipient body mass index (BMI), recipient coronary artery disease, recipient hypertension (HTN), recipient peripheral vascular disease , recipient diabetes mellitus (DM), donor sex, donor race, donor weight, donor BMI, donor HTN, donor DM, Human leukocyte antigen mismatch, Panel reactor antibody group, Expanded criteria donor, Donation after cardiac death

Abstract# 423

Non-Invasive Measurement of Transplant Kidney Fibrosis Using Photoacoustic Imaging

E. Hysi[1], X. He[1], A. Krizova[1], M. Ordon[1], K. T. Pace[1], M. Farcas[1], M. C. Kolios[2], D. A. Yuen[1], *[1]St. Michael's Hospital, Toronto, ON, Canada, [2]Ryerson University, Toronto, ON, Canada*

Purpose: The presence of donor kidney fibrosis adversely impacts transplant outcome. Biopsy remains the only method that can assess fibrosis, despite being subjected to sampling bias as it measures <1% of the kidney volume. In this work we propose to use collagen-specific photoacoustic (PA) imaging as a non-invasive and contrast-free tool for measuring kidney fibrosis. PA imaging relies on the detection of sound waves produced by short laser burst illuminations of the kidneys.

Methods: This technology was tested in a unilateral ureteral obstruction (UUO) model of mouse kidney fibrosis (Fig. 1A). Surgery was performed on n = 10 mice and the left ureter was obstructed for either 7 or 14 days. Comparisons with sham surgery performed on n = 5 mice were also conducted. The kidneys were procured, and PA imaging was performed before sectioning each kidney for histology. Using multiwavelength PA images acquired from a handheld probe, a novel collagen estimation algorithm was implemented to compute renal fibrotic burden. Its accuracy in estimating collagen was compared to the gold standard histology. The algorithm was further tested in human radical nephrectomy specimens, as well as in whole human kidneys in a setting mimicking the ex vivo phase of kidney transplantation surgery.

Results: PA-measured fibrosis scores correlated strongly with gold standard histology measurements, being able to detect increasing levels of fibrosis (Fig. 1B). PA imaging of the cortex of whole human kidneys was possible by imaging over the entire kidney surface (Fig. 1C). Our PA technique was able to accurately capture inter-kidney variation in fibrosis levels (Fig. 1D) with excellent accuracy (Fig. 1E). As seen in mouse kidneys, PA imaging could also to detect intra-renal differences in human kidney fibrosis (Fig. 1F).

Conclusions: This study demonstrates for the first time the potential of PA imaging as a non-invasive renal fibrosis measurement tool. By directly imaging collagen, this technology is non-invasive, contrast-free, sensitive to a wide range of fibrosis burdens and can be performed in just minutes without impeding the transplant procedure. Taken together, these findings suggest that PA imaging may be able to play an important role in assessing the level and spatial distribution of fibrosis in *ex vivo* donor kidneys. A clinical trial to assess the feasibility of ex vivo donor kidney PA imaging at the time of transplant to assess allograft fibrosis and outcomes is scheduled to commence early next year.

Abstract# 424

Towards National Organ Sharing: Fair Distribution of Eplets in Canada

S. Parto, B. Liu, W. Klement, S. Oikonomopoulos, I. Ragoussis, R. Sapir-Pichhadze, *McGill University, Montreal, QC, Canada*

Purpose: Eplet matching is being promoted as a rational approach to prevent immune-mediated injuries in transplantation. We studied the frequencies of eplets in a Canadian population to inform strategies to secure HLA compatible transplants regionally and nationally.
Methods: We analyzed data from the first phase of the Canadian Longitudinal Study on Aging (CLSA). A total of 6298 participants were of diverse ancestry from Alberta (N=613), British Columbia (N=1348), Manitoba (N=646), Newfoundland (N=493), Nova Scotia (N=665), Ontario (N=1357) and Quebec (N=1176)). All these participants had complete allele-level genotypes for 11-loci (HLA-A, -B, -C, -DRB1/3/4/5, -DQA1, -DQB1, -DPA1 and -DPB1) imputed by the HLA*IMP:02 method. HLA genotypes were converted to epitypes using the eplet repertoire recorded on the HLA Epitope Registry (accessed September 2018). Frequencies of antibody-verified (AbVer) and non-AbVer eplets were determined. Intraclass Correlation Coefficients (ICC) were calculated to assess differences in eplet frequencies by participants' province.
Results: A total of 223 class I (72 AbVer) and 286 class II (82 AbVer) were observed in the cohort. Five eplets (0.01%) were not observed in any participant. There was significant agreement in eplet frequencies across Canadian provinces (ICC of 0.99). The eplets were distributed in the studied population as follows: 6 class I (0 AbVer) and 5 class II (0 AbVer) eplets were observed in <1%; 51 class I (22 AbVer) and 42 class II (11 AbVer) eplets were observed in 1-25%; 50 class I (22 AbVer) and 71 class II (25 AbVer) were observed in 25-50%; 45 class I (14 AbVer) and 59 class II (30 AbVer) were observed in 50-75%; and of 68 class I (14 AbVer) and 107 class II (16 AbVer) were observed in >75%.
Conclusions: Similar eplet frequencies were observed across Canadian provinces. Thus, a strategy of matching at the eplet level to prevent immune-mediated injuries is expected to perform similarly across Canada. The understanding of risk associated with particular mismatched eplets, coupled with measured frequencies, can guide when regional allocation may need to be supplemented by national organ sharing policies.

Abstract# 425

Effect of Multi-Organ Transplant Allocation on Pediatric Kidney Waitlist Candidates

D. Shepherd, R. M. Engen, *Pediatric Nephrology, Ann & Robert H. Lurie Children's Hospital, Chicago, IL*

Purpose: Multi-Organ Transplants (MOTs) have variable allocation policies and often take precedence over other waitlist candidates. Lack of defined MOT guidelines divert kidneys to MOT recipients who have worse morbidity and mortality and supersede qualified pediatric candidates who generally are healthier and have much greater estimated post-transplant survival; however, the impact of this allocation policy is poorly defined.
Methods: We analyzed UNOS kidney transplant alone (KTA) match list data from 4/1/2015-10/31/2019 for kidneys with a Kidney Donor Profile Index <35% that were allocated to a MOT. Our cohort consisted of pediatric candidates listed for KTA who were the next-sequential candidate and who did not receive the contralateral kidney from the same donor.
Results: Of the next-sequential candidates on the kidney-match run lists for kidneys allocated to MOT recipients, 256 were pediatric candidates. Overall, 6.9% of pediatric recipients were affected by MOT allocation. At the time of the offer 78.1% of these candidates were receiving dialysis. Subsequent kidney transplants occurred in 80.9% of the next-sequential pediatric candidates, at a median additional wait time of 84 days (IQR 37-187 days). Forty-nine children (19.1%) had no documented transplant as of 3/20/2020. No pediatric candidates died or were removed from the waitlist during the study period. Median additional accrued wait time was significantly longer for recipients with B blood type (118 days (IQR 64-208 days), p=0.004) and calculated panel reactive antibody >0% (125.5 days (IQR 33-150 days), p=0.014). There were no significant differences by recipient ethnicity or UNOS region.
Conclusions: Multiorgan allocation policies affect pediatric KTA wait times, with more significant effect seen in individuals already at a disadvantage, such as those with sensitization or B blood type. Further discussion of MOT allocation policies is needed to ensure that policies maximize utility and equity.

Abstract# 426

Response to a Pandemic: The Fall and Rise of Kidney Transplantation in the US

S. Bisen[1], B. Boyarsky[1], W. Werbel[1], J. Snyder[2], J. Garonzik-Wang[1], D. Segev[1], A. Massie[1], *[1]JHU, Baltimore, MD, [2]SRTR, Minneapolis, MN*

Purpose: During the first wave of the COVID-19 epidemic in March-April 2020, waitlist registrations and living/deceased donor kidney transplants (LDKT/DDKT) dropped substantially. A second wave of infection peaked in August; a third wave began in late October and has not yet peaked. The effects on kidney transplantation in the US during the most recent waves have not yet been described.
Methods: Using SRTR data, we compared observed waitlist registrations, waitlist mortality, LDKT, and DDKT 3/15/2020-10/31/2020 to expected events based on calculations from pre-epidemic data 1/2016-2/2020, overall and stratifying by state-level COVID-19 incidence, while accounting for patient casemix.
Results: New listings bottomed at 45% below expected in May (IRR = $_{0.52}0.55_{0.57}$) but steadily recovered to 6% below expected by October (IRR = $_{0.91}0.94_{0.97}$) (Table, Figure). Waitlist deaths peaked at 72% above expected in March/April (IRR = $_{1.60}1.72_{1.85}$), bottomed at 7% above expected in June (IRR = $_{0.96}1.07_{1.20}$), and have since risen only slightly to 16% above expected in August (IRR = $_{1.04}1.16_{1.29}$); July/August waitlist mortality increases were restricted to states with the highest COVID-19 burden (August IRR = $_{1.05}1.19_{1.36}$). DDKT was below expected through June in states with the highest COVID-19 burden (IRR = $_{0.64}0.80_{0.99}$). Nationwide, DDKT peaked in July at 11% above expected (IRR = $_{1.06}1.11_{1.17}$) and have since dropped only slightly to 5% above expected by October (IRR = $_{0.99}1.05_{1.10}$). LDKT bottomed at 87% below expected in March/April (IRR = $_{0.10}0.13_{0.15}$), peaked at 10% below expected in July (IRR = $_{0.82}0.90_{0.98}$), before the second wave peaked, and then dropped slightly to 14% below expected during September and October (IRR = $_{0.79}0.86_{0.94}$).
Conclusions: Each successive wave had a lesser impact on transplant and waitlist mortality rates. New listings have approached pre-pandemic rates, suggesting that the medical system has successfully adapted to the challenges of COVID-19, despite occasionally high patient load caused by additional epidemic waves. Decreased mortality may reflect improved care, but may also indicate that true COVID-19 incidence during the first wave was substantially higher than detected.

Table. Observed center-level events as a proportion of expected events, March 15 - June 30, 2020. Bold denotes statistically significant IRRs.

Abstract# 427

Developing and Validation of a Liver Transplantation Donation After Cardiac Death Risk Index Using the UNOS Database

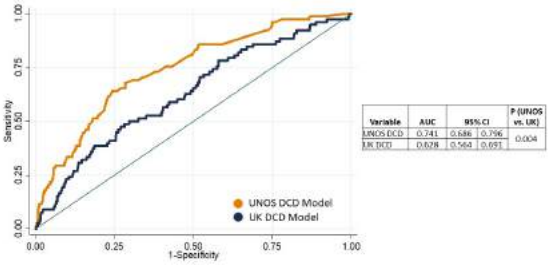
L. Chau, K. Delvecchio, A. Mohamed, M. Lu, T. Kitajima, S. Yedulla, K. Collins, M. Rizzari, A. Yoshida, M. Abouljoud, S. Nagai, *Division of Transplant and Hepatobiliary Surgery, Henry Ford Hospital, Detroit, MI*

Purpose: Donation after cardiac death (DCD) liver transplantation is an increasing form of organ donation. Shlegal et. al. identified seven factors predicting 1-year DCD graft survival based on the UK transplantation population. This project aims to validate the existing predictive model and to develop a novel DCD graft failure prediction model based on the UNOS database.

Methods: We examined all adult DCD transplanted Jan 1 2014 to Mar 31 2020 in the UNOS registry. The population was divided into train (66%) and validation (34%) subsets. Variables of interest were selected from the train subset with backwards stepwise selection with criteria for entry P = 0.05 and exit P = 0.06. Logistic regression models were fitted based on selected variables to predict 1-year graft failure. Performance of the model was assessed in the validation population by computing the area under the receiver operating characteristic curve (AUROC) after 10-fold stratified cross-validation. The performance of the novel model was compared to the UK DCD prediction model.

Results: 2738 DCD transplants were included in this study with 1835 in the train and 903 in the validation subsets. The model identified 12 factors predictive for 1-year graft failure among DCD recipients. The model AUROC was 0.741 (95% CI: 0.686, 0.796). When validating the UK DCD model in the UNOS database, the model achieved AUROC of 0.628 (0.564, 0.691).

Conclusions: This model identified 12 predictive factors predictive of 1-year graft failure among DCD recipients from the UNOS database, which outperformed the existing model.



Variable	AUC	95% CI		P (UNOS vs. UK)
UNOS DCD	0.741	0.686	0.796	0.004
UK DCD	0.628	0.564	0.691	

Variable	OR	P	95% CI
Caucasian donor	0.62	0.041	0.39, 0.98
Donor LVEF ≥75%	1.72	0.038	1.03, 2.87
Donor cancer history	3.17	0.01	1.31, 7.64
Donor pH ≤7.3	2.82	<0.001	1.60, 4.98

Abstract# 428

Clinical Correlation of Frailty Measures and Evaluation of Complementary Molecular Frailty Biomarker Candidates in a Prospective National Cohort of Liver Transplant Candidates

S. Cremen[1], M. Robinson[2], T. Gallagher[1], *[1]Department of Hepatobiliary and Transplant Surgery, St Vincent's University Hospital, Dublin, Ireland, [2]Department of Biology, Maynooth University, Kildare, Ireland*

Purpose: Frailty is a clinical condition characterized by a loss of physiologic reserve and increased susceptibility to stressors. Molecular frailty biomarkers may reflect the dysregulation of physiological systems leading to this reduced physiological reserve, but as yet such complementary biomarkers have not been identified. The aims of this research were to assess the prevalence of frailty in those referred to the Irish Liver Transplant Program, assess its impact on outcomes and analyse the relationship between clinical frailty and biomarkers of frailty.

Methods: 70 patients were prospectively evaluated while undergoing liver transplant assessment. Frailty assessments included Liver Frailty Index (LFI), Fried Frailty Index (FFI), and Rockwood Frailty Score (RFS) and standardized sarcopenia measurements. Serum irisin, S100B, leptin and PAI-1 concentrations were assayed (ELISA) in a subset of patients Assessments were repeated at 3-monthly intervals whilst wait-listed. Clinical outcomes included decompensation-related hospitalisations, time on the waiting-list, post-transplant ICU- and overall-length of stay, 30-day mortality and morbidity post-transplant.

Results: Clinical frailty ranged from 20% to 37%, depending on the frailty score. Increasing FFI and RFS scores were associated with increased S100B (p=0.02). There was also a positive correlation between higher MELD-Na (Model for End-Stage Liver Disease) and PAI-1 (p=0.014) and negative correlation between MELD-Na and Leptin (p=0.059). While waitlisted, frail patients showed a trend towards increased admissions with decompensation compared to non-frail patients (70% vs 29.4%, p=0.057). Increasing MELD-Na, RFS and female sex were associated with an increased likelihood of admission with liver decompensation while on the waiting list. Frailty increased while on the waitlist, but the frailest patients spent a significantly shorter period on the waiting list, due to transplantation or death (Median 22 days (frail) vs 95 days (non-frail), p= 0.026).

Conclusions: Frail patients portended towards a worse stage of liver disease and were admitted to hospital more frequently with decompensation, but spent less time on the waiting list. This adds objectivity to what was previously a nuanced aspect of patient selection at the time of donor offer. An association between clinical frailty scores and novel molecular biomarkers of frailty was demonstrated for the first time. This has significant diagnostic and prognostic implications going forward and warrants validation in larger cohorts.

Abstract# 429

Systematic Implementation of Alcohol Screening Program Using Urine Ethyl Glucuronide Can Identify Post-transplant Alcohol Use and Aid Return to Sobriety in Liver Transplant Recipients

N. Lim[1], T. Leventhal[1], M. Thomson[1], M. Hassan[1], J. Thompson[1], S. Chinnakotla[2], V. Kirchner[2], T. Pruett[1], R. Kandaswamy[2], V. Humphreville[2], A. Adams[2], J. Lake[1], *[1]Division of Gastroenterology, Hepatology and Nutrition, University of Minnesota, Minneapolis, MN, [2]Division of Transplantation, University of Minnesota, Minneapolis, MN*

Purpose: Rates of liver transplantation (LT) for alcohol-related liver disease (ALD) are increasing, particularly in patients with acute alcoholic hepatitis. Post-LT alcohol (ETOH) use has significant implications for graft and overall survival. We report the findings from the implementation of a ETOH screening program using urine ethyl glucuronide (EtG) for post-LT patients with ALD at our center.

Methods: As part of a prospective quality improvement initiative starting on 6/1/2016, patients who received LT for ALD underwent mandatory quarterly screening for ETOH use with urine EtG for the first 12 months after LT. Patients who had received a LT for any cause underwent urine EtG testing on an "as needed" basis when ETOH misuse was suspected. Adherence to screening was defined as completion of 4 urine EtG tests over the first 12 months after LT. A positive test was defined as urine EtG>500ng/ml, indicative of significant ETOH use. Positive tests resulted in the execution of a protocol involving the patient's RN coordinator, hepatologist, social worker and chemical dependency resources.

Results: 296 adult patients underwent LT from June 1st 2016 to 30th September 2020. 106 patients were transplanted for ALD- 103 patients with cirrhosis, 3 patients with ETOH hepatitis. Median age at LT was 53 years, 80 (75%) patients were male, 87 (85%) patients were white and median laboratory MELD at LT was 29. 69 (65%) patients had a pre-LT diagnosis of mental illness. Adherence to ETOH screening was low overall (Table 1). Reasons for non-adherence included hemodialysis, patient refusal and laboratory error. 11/106 (10.4%) patients who received LT for ALD were EtG(+). 2/11 (18%) patients successfully completed chemical dependency treatment. 3 patients who received a LT for non-ALD tested positive: 1 patient with HCV, 1 with AIH & 1 with NASH. Of note, an additional 11 patients who received LT prior to the study period were EtG(+), up to 6 years post-LT.

Conclusions: Systematic implementation of regular ETOH biomarker screening identifies ETOH use in patients transplanted for ALD and can identify significant ETOH use in patients with no prior diagnosis of ETOH misuse. Despite the application of protocols for positive testing, mandatory chemical dependency treatment is difficult to enforce in the post-LT period.

Table 1- Adherence to ETOH Screening per transplant year

Year	Adherence (%)
2016	2/7 (28.6%)
2017	4/25 (16%)
2018	3/13 (23.1%)
2019	9/33 (27.3%)
2020	15/28 (53.6%)
p-value (Fisher's Exact)	0.483

Abstract# 430

Growing LDLT Volumes at a US Center- What Does It Take to Do Over 100 LDLTs Per Year

A. Humar, C. Hughes, G. Mazariegos, K. Soltys, A. Gallatin, K. Emmett, A. Tevar, M. Molinari, A. Ganoza, V. Gunabushanam, S. Ganesh, *University of Pittsburgh, Pittsburgh, PA*

Purpose: LDLT remains underutilized in the US, accounting for <6% of the annual total liver transplant volume. We examined methods we have incorporated to expand LDLT volume at our center.

Methods: Data was collected on all donors and recipients that underwent LDLT at our center, looking at the impact of various programs on total volumes.

Results: LDLT remains underutilized in the US, accounting for <6% of the annual total liver transplant volume. We have made a concerted effort to grow LDLT at our program and it now represents 60% of our annual total adult liver transplant volume and 40% pediatric total volume. In 2020, we will perform >100LDLTs at our program (91 adults, 12 pediatric, Figure1). Growth in volume has been due to many factors, including a change in our philosophy to consider an LDLT as the 1st and best option for the vast majority of our patients. We utilized paired exchanges (6 pairs, 12 transplants), ABO incompatible donors (n=1), as well as non-directed donors (n=13) to maximize donor acceptance and utilization. Our donor acceptance rate is 70%, with our most common reason for donor exclusion being steatotic liver or psychosocial factors. We have excluded very few donors based on GW/RW ratio; 11% of the adult transplants had GW/RW<0.8%. We have utilized extensive education programs, targeted for individual recipients as well as for the general public to raise awareness regarding LDLT. All recipients are seen by the LD team and are offered programs such as our Champions program to help them identify suitable living donors. For recipient selection, MELD- either at the upper or lower end- are not considered contraindications to LDLT. We also offer LDLT to recipients who may not qualify for a deceased donor, but we know are likely to have a better outcome with liver transplant vs best other therapy. This includes patients with HCC beyond Milan, cholangiocarcinomas (hilar and intrahepatic, n=2), metastatic colorectal cancers (n=2), as well as other expanded indications. Despite expanded indications, results have been acceptable. All donors are well with 2 early bile leaks (both managed non-operatively), and 3 reoperations (1 bleeding, 1 SBO, 1 incisional hernia). No donor required blood transfusion. Recipient graft and patient survival is 95% and 96% in the adult patients. Survival has been 100% in the pediatric patients.

Conclusions: Utilization of LDLT can be safely expanded as programs gain more comfort level and experience with the procedure.

Abstract# 431

Impact of Extended Living Donor Criteria on Donor Safety in Living Donor Liver Transplantation

J. KIM, *Department of Surgery, Catholic University of Daegu College of Medicine, Daegu, Korea, Republic of*

Purpose: Donor safety is major concern during living donor liver transplantation (LDLT) and most transplant centers accept strict selection criteria although some centers have been trying to modify these strict criteria to expand donor pools. Herein, we describe out center's experience for extended living donor criteria for LDLT focusing on donor safety.

Methods: retrospectively reviewed the outcomes of 424 living donor right hepatectomy (LDRH) including 105 donors under extended criteria at our institution from January 2010 to June 2019. Extended Donor was defined with criteria as follows; 1) old donor (age >40 years) with remnant liver volume of <35%, 2) young donor (age ≤40 years) with remnant liver volume <29% and minimal fatty change (<15%), 3) young donor with mild hepatosteatosis (15%-30%) and remnant liver volume of < 35%. The outcomes in extended living donors were compared with those in living donors under conventional criteria focusing on donor safety. We also analyzed risk factors related to posthepatectomy liver failure (PHLF).

Results: PHLF occurred in 43 donors (10.1%) and most cases were grade A except one case in conventional donor group (grade B) and PHLF did not occur more frequently in extended donor group. (7.6% vs. 11.0% % P = 0.32) and the incidence of major postoperative complications did not differ between the 2 groups. Moreover, no difference in either posttransplant graft function or survival was apparent between the 2 groups. In multivariate logistic regression analyses, only the event for major complications (OR, 3.002; 95% CI, 1.042-8,649; P = 0.042) was associated with PHLF but not related to our extended criteria.
Conclusions: LDRH under our extended criteria could be performed to expand donor pools without adverse effects on donor safety.

Abstract# 432

Pre Transplant Estimated Glomerular Filtration Rate and Other Predictors of Mortality and End Stage Kidney Disease After Lung Transplantation

A. Kumar[1], L. N. Bonnell[2], C. Thomas[3], *[1]Internal Medicine, University of Vermont, Burlington, VT, [2]Department of General Internal Medicine Research, University of Vermont, Burlington, VT, [3]Internal Medicine, University of Iowa, Iowa City, IA*

Purpose: Lung transplantation is an established treatment for end stage lung disease and as survival has improved, chronic kidney disease (CKD) has become a common complication. Prevalence of CKD has been reported at 22% at one year and about 50%-70% at five years after transplantation. Patient age, acute kidney injury, high serum tacrolimus levels, hypertension and diabetes have been associated with increased frequency of CKD post lung transplant. Aim of the present study is to determine if pre transplant CKD is a predictor of long term risk of post lung transplant mortality and end stage kidney disease (ESKD).
Methods: We evaluated United Network of Organ Sharing (UNOS) database from 2000-2017 to include adult patients who had lung transplant, had no prior history of any transplant and were not on dialysis. We divided our cohort into four clinically relevant groups based on their estimated glomerular filtration rate (eGFR) at the time of transplant (≤44, 45-59, 60-89, ≥90ml/min/1.73m^2). Our primary outcome was death and secondary outcome was ESKD. Cox regression was used to assess the effect of eGFR on mortality and cumulative incidence competing risk (CICR) (death as a competing event) method was used to see the effect of eGFR on ESKD.
Results: We had 131, 344, 3227 and 15870 patients in groups with eGFR ≤44, 45-59, 60-89, ≥90ml/min/1.73m^2 respectively. Absolute number and percent of deaths and ESKD are shown in table 1. Kaplan Meier curves for mortality and ESKD shown in figure 1 and 2 respectively. Table 2 shows the adjusted hazard ratios for mortality and ESKD in each group.
Conclusions: Our findings shows that risk of mortality post lung transplant increases with worsening eGFR at the time of transplant. Risk of ESKD is higher for patients with eGFR between 60-89ml/min/1.73m^2 as compared to patients with eGFR ≥90ml/min/1.73m^2 but not for patients who had eGFR<60ml/min/1.72m^2. This reflects the competing risk of high mortality in patients with eGFR <60ml/min/m^2 diminishing the residual risk of ESKD.

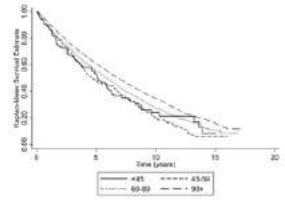

Figure 1: Kaplan Meier curve for mortality

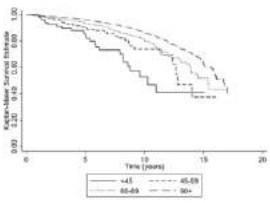

Figure 2: Kaplan Meier curve for ESKD

Table 1: Absolute numbers of death and ESKD in each of the four groups

eGFR at listing (numbers)	≤44 (131)	45-59 (344)	60-89 (3227)	≥90 (15870)
Mortality (%)	91 (72)	226 (66)	1834 (58)	8116 (52)
ESKD (%)	25 (19)	35 (10)	249 (8)	904 (6)

Table 2: Adjusted hazard ratio (aHR) (with p value and confidence interval (CI))

eGFR at listing	≤44	45-59	60-89	≥90
Mortality (aHR)	1.39 (p=0.009 CI 1.08-1.79)	1.19 (p=0.017 CI 1.03-1.39)	1.06 (p=0.028 CI 1.007-1.13)	1
ESKD (aHR using Cox regression)	4.28 (p=<0.001 CI 2.85-6.3)	1.76 (p=0.002 CI 1.24-2.50)	1.29 (p=0.001 CI 1.11-1.49)	1
ESKD (aHR using CICR)	1.91 (p=0.259 CI 0.62-5.8)	1.88 (p=0.078 CI 0.93-3.80)	1.57 (p=0.003 CI 1.16-2.13)	1

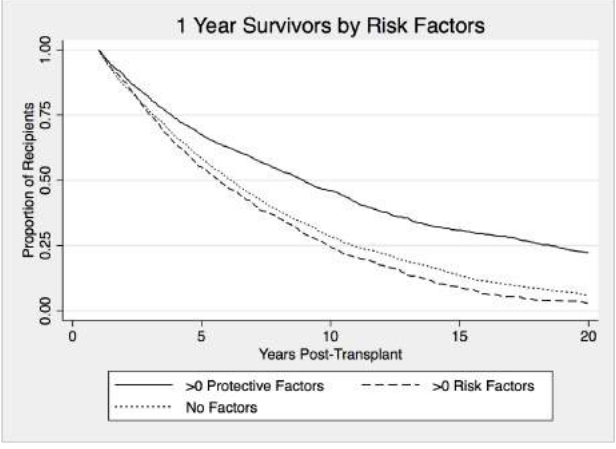
Rana[4], *[1]Office of Student Affairs, Baylor College of Medicine, Houston, TX, [2]Department of Surgery, University of Miami Health System, Miami, FL, [3]Department of Medicine, Baylor College of Medicine, Houston, TX, [4]Michael E. DeBakey Department of Surgery, Baylor College of Medicine, Houston, TX*

Purpose: Outcomes following lung transplantation (LTx) have been poor compared to those of heart, liver, and kidney transplants, with 5-year survival rates around 50%. To our knowledge, there has been no analysis on factors associated with extended survival past 20 years post-transplantation.
Methods: All LTx cases performed between 1987 and 2000 within the United Network for Organ Sharing (UNOS) database were reviewed. Adult patients undergoing single or bilateral LTx who survived at least 1-year post-transplant were included. Demographic factors were compared between 1-20 year survivors and those surviving greater than 20 years using Student's t-test (continuous) and Chi-square test (categorical). Kaplan-Meier and logistic regression analyses were performed to identify trends and risk factors associated with survival long-term survival. Cox regression analysis was then used to assess the impact of protective and risk factors on survival.
Results: A total of 4,731 recipients were included in the analysis, including 311 recipient who lived greater than 20 years following transplantation. Factors associated with 20-year survival include recipient age 25-35 (OR 0.48-0.51), donor cause of death by head trauma (OR 0.70), female to female donor-recipient gender match (OR 0.74), diagnosis of COPD or Emphysema (OR 1.57), single lung transplant (OR 2.20), and recipient age 55-65 (OR 3.22). Cox regression risk factor analysis showed that patients with 1 or more protective factors were more likely (HR 0.88) to live to 20 years than patients with 1 or more risk factors (HR 1.30).
Conclusions: The factors that lead to 20-year survival following LTx are different than those classically associated with shorter-term survival. Understanding the longer-term outcomes following LTx is important for all aspects of lung transplantation management, from pre- and post-operative management to donor allocation.



20-Year Survival - Significant Factors on Multivariate Regression			
	Odds Ratio	P value	Confidence Interval

Abstract# 434

Basiliximab versus Alemtuzumab: The Association Between Induction Agent and Airway Complications Following Lung Transplantation

M. Furukawa[1], E. G. Chan[1], T. Harano[1], J. Ryan[1], R. Rivosecchi[2], M. R. Morrell[1], P. G. Sanchez[1], *[1]Cardiothoracic Surgery, UPMC, Pittsburgh, PA, [2]PUH-Pharmacy, UPMC, Pittsburgh, PA*

Purpose: Controversy still exist regarding the best induction strategy for lung transplantation. At our institution, induction is defined based on donor recipient CMV match. While less steroids are used following alemtuzumab induction, basiliximab requires a longer taper in the immediate postoperative period. We investigated the association between the type of induction and airway dehiscence following lung transplantation.

Methods: We retrospectively reviewed 556 consecutive LT performed at our institution (6/2013 - 6/2020). Only 2 patients received thymoglobulin induction and were excluded. Airway dehiscence was confirmed by bronchoscopy and grade by ISHLT recommendations. Categorical variables were analyzed with chi-square and continuous variables were analyzed with Mann-Whitney U tests. Multivariable logistic regression was used to identify predictors of airway dehiscence.

Results: Mean age of our cohort was 55 years old (range 20-76). There was an even distribution of alemtuzumab and basiliximab as the induction agent (278 vs 276 cases). Airway dehiscence was bronchoscopically diagnosed in 27 patients (4.9%). Variables associated with airway dehiscence included basiliximab induction (p=0.03), open chest after surgery (p=0.01), return to OR for major procedure (p=.001), and postoperative hepatic dysfunction (p=0.003). Patients who experienced airway dehiscence required longer mechanical ventilatory support (23 vs 5 days, p<0.001) and ICU stay (3 vs 2 days, p=0.048). There was no significant difference in overall survival between patients with and without bronchial dehiscence (p = 0.17). Multivariate analysis further identified only the use of basiliximab for induction as an independent predictive factor of postoperative airway dehiscence (p=0.018).

Conclusions: Based on our analysis, patients that received basiliximab induction for lung transplantation experienced a higher risk of postoperative airway complications when compared with patient who receive alemtuzumab induction. We believe this may be associated with a higher steroid use in this population. Additional studies are necessary to further characterize the relationship between induction agents and airway complications following transplantation.

Abstract# 435

Sensitized Lung Candidates Experience Reduced Access to Donor Organs

K. Lindblad[1], R. Goff[2], D. Stewart[2], *[1]UNOS, Richmond, VA, [2]UNOS, Richmnd, VA*

Purpose: Most studies of sensitization in transplant candidates have focused on kidney candidates, and unacceptable antigens (UAs) for non-kidney candidates are believed to be underreported. In this study we examine sensitization in lung candidates, the frequency of reporting, and sensitization's effect on offer rates.

Methods: We used OPTN data to analyze the number of offers received by adult lung-alone registrations ever waiting 1/1/10-6/30/20. Bypass offers and offers from

match runs where no organ was placed were excluded. We used the UNOS CPRA API to determine calculated panel reactive antibody (CPRA) values for all registrations at every time point where UAs were entered.

Results: Of 29,586 registrations, 5,607 (19.0%) had at least one UA in their most recent waiting list record. Among sensitized candidates, the CPRA distribution across all centers was similar to the distributions at centers reporting UAs for ≥ 15% of their candidates or ≥ 25% of candidates (Fig 1). As expected, offer rates declined steadily as CPRA increased, and registrations with a CPRA ≥ 90% had an offer rate an order of magnitude lower than registrations with a mild to moderate level of sensitization (Fig 2).

Fig 1: Distribution of CPRA for Sensitized Lung Candidates

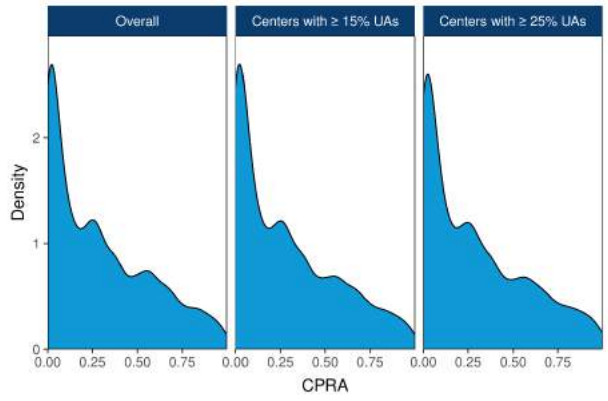

Fig 2: Offers per Active Year Waiting by CPRA Group

Conclusions: The distribution of CPRA for sensitized lung registrations is remarkably similar for all registrations vs registrations at centers entering the most complete sensitization data. This suggests that the overall CPRA distribution reflects the true distribution of CPRA for sensitized candidates, despite potential underreporting of UAs. The offer rate also decreases as CPRA increases, indicating that sensitized candidates have reduced access to donor lungs. These data support the inclusion of CPRA as an attribute in a points-based, "continuous distribution" policy for lungs.

Abstract# 436

Lung Transplant Recipients with Severe Acute Respiratory Syndrome-Coronavirus 2 Infection and Asymptomatic Carriers Waiting for Lung Transplantation Induce Circulating Exosomes with Severe Acute Respiratory Syndrome-Coronavirus 2 Spike Protein S2

S. Bansal, S. Tokman, T. Fleming, M. Smith, R. Bremner, T. Mohanakumar, *St. Joseph's Hospital and Medical Center, Phoenix, AZ*

Purpose: Exosomes are vesicles released by cells into body fluids. We demonstrated increased circulating exosomes with lung self-antigens (Collagen V, Kα1 Tubulin) and viral antigens in lung transplant recipients (LTxRs) undergoing rejection. Severe acute respiratory syndrome coronavirus 2 (SARS-CoV2), an important risk factor for LTxRs in immunosuppression and patients with diseased lungs waiting for transplantation. Our goal is to determine that exosomes from LTxRs with SARS-CoV2 infection carry SARS-CoV2 spike protein.

Methods: We analyzed 30 patients waiting for LTx with no clinical symptoms and 7 LTxRs with SARS-CoV2 infection and symptoms. Exosomes were isolated from plasma by precipitation kit, 0.2 micron filtration and size determination by Nanosight300. Eluted protein from gel was analyzed by mass spectrometry and peptides were aligned with SARS-CoV2. Transmission electron microscopy of exosomes was performed for spike and nucleocapsid antigen. Exosomes were also characterized by western blot for immune and molecular markers. Serum cytokines were analyzed using 25 Plex on Luminex.

Results: Exosomes from symptomatic (7/7) and 7/30 (23.3%) asymptomatic LTxRs contained SARS-CoV2 spike protein S2 and increased levels of SARS-CoV2 RNA. SARS-CoV2 spike protein in exosomes was confirmed by mass spectroscopy. Transmission electron microscopy from symptomatic and asymptomatic LTxRs revealed spike protein and nucleocapsid antigen on exosomes. Exosomes contained macrophage stimulating factor 1, GRAnzyme B and angiotensin type II receptor 1 proteins. Increased levels of CXCL10 in sera were detected in SARS-CoV2 positive symptomatic patients, agreeing with the reports that CXCL10 levels correlate with disease severity.

Conclusions: SARS-CoV2 infected LTxRs symptomatic and asymptomatic induced circulating exosomes having spike protein, nucleic acid and antigens related to viral entry (angiotensin type II receptor), infection (macrophage stimulating factor 1) and cytotoxic molecule (GRAnzyme B) suggesting that the exosomes induced by SARS-CoV2 will have functional consequences. Exosomes also contained increased levels of viral RNA and antigens suggesting that circulating exosomes may provide a noninvasive tool for detection of SARS-CoV2 infection.

Abstract# 197

Overall Survival by Best Overall Response with Tabelecleucel in Patients with Epstein-Barr Virus-Driven Post-Transplant Lymphoproliferative Disease After Solid Organ Transplant

S. Prockop[1], L. Gamelin[2], R. Dinavahi[2], Y. Sun[2], N. Guzman-Becerra[2], H. Parmar[2], *[1]Memorial Sloan Kettering Cancer Center, New York, NY, [2]Atara Biotherapeutics, South San Francisco, CA*

Purpose: Tabelecleucel is an investigational, off-the-shelf, allogeneic Epstein-Barr virus (EBV)-specific T-cell immunotherapy being studied in patients (pts) with serious EBV-driven diseases, including post-transplant lymphoproliferative disease (EBV$^+$ PTLD). Pts with EBV$^+$ PTLD after solid organ transplant (SOT) who relapsed with rituximab and did not respond to or did not receive additional chemotherapy (CT) had a median overall survival (OS) of <3 months (Zimmermann EHA 2019), demonstrating a substantial unmet need in relapsed/refractory (R/R) EBV$^+$ PTLD after SOT. We have previously shown that pts with EBV$^+$ PTLD after SOT who responded (complete response [CR] or partial response [PR]) to tabelecleucel have clinical benefit, including 100% 2-year survival rates (Prockop ASH 2019 and JCI 2019). Here, we report aggregate OS in patients with EBV$^+$ PTLD after SOT with CR or PR with tabelecleucel treatment.

Methods: Treatment response and OS were assessed in three studies (NCT00002663, NCT01498484 and NCT02822495). All pts received tabelecleucel at ≈2 x 10^6 cells/kg on Days 1, 8 and 15 in a 35-day treatment cycle. Pts received a median (range) of 2 (1-9) cycles.

Results: Twenty-six SOT recipients with EBV$^+$ PTLD R/R to rituximab (SOT1 n=7) or rituximab+CT (SOT2 n=19) were treated. The objective response rate (PR+CR) was 65% (17/26) overall, 86% (6/7) in SOT1, and 58% (11/19) in SOT2. Similar survival rates were observed across pts with best overall response (BOR) of CR or PR, including in the SOT1 and SOT2 subgroups (Table 1, Figure 1). Treatment was well tolerated with no confirmed evidence for graft vs host disease, cytokine release syndrome or neurotoxicity in relation to tabelecleucel in these very sick, treatment refractory, and immunocompromised pts.

Conclusions: These data show that not only pts with complete responses, but also pts with partial responses to tabelecleucel, may obtain longer-term clinical benefit, demonstrating a favorable risk–benefit profile in this high-risk population for whom there are no approved alternative therapies.

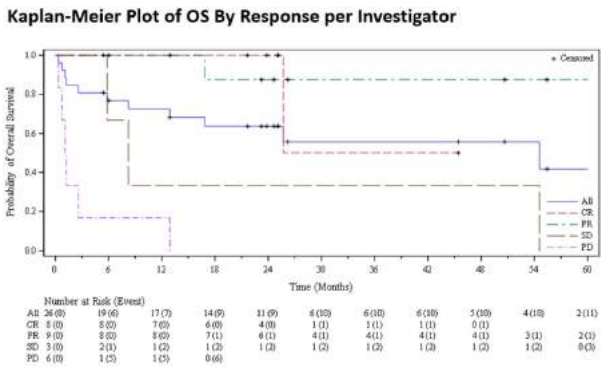

Table 1. OS by BOR

Abstract# 198

TIGIT Agonism Improves Immunosuppression of Cd8 T Cells by Ctla-4ig in a Treg Dependent Manner

C. R. Hartigan, D. Liu, M. L. Ford, *Emory University Transplant Center, Emory University, Atlanta, GA*

Purpose: Costimulation blockade therapeutics for immunosuppression in transplant are less toxic than calcineurin inhibitors offering improved graft longevity and patient quality of life, but belatacept-resistant rejection (BRR) has slowed the wide-spread adoption of costimulation blockade therapeutics in the clinic. To overcome BRR we need to target other costimulatory pathways to enhance immunosuppression by belatacept. The purpose of this study is to determine in mice if agonizing TIGIT, a T cell immune receptor with Ig and ITIM domains, will suppress activated or memory T cells responding to allograft and additionally increase the suppressive capacity of Tregs to work in concert with CTLA-4Ig.
Methods: To assess the efficacy of an agonistic anti-TIGIT antibody, we used a minor antigen mismatch model of skin graft with the model antigen OVA in addition to full allogenic mismatch with Balb/C to B6 skin grafts and evaluated graft survival and T cell responses in the graft, draining lymph nodes, and spleens of recipient mice. Mice were given $1e^6$ OT-I and OT-II T cells by adoptive transfer or $10e^6$ donor splenocytes prior to bilateral skin graft and received immunosuppression (or vehicle control) on days 0, 2, 4, and 6 after grafting. Animals were sacrificed at day 10 or monitored long-term for graft survival.
Results: Combination therapy of the TIGIT agonist with CTLA-4Ig improved graft survival compared to individual therapy with either CTLA-4Ig or TIGIT agonist with an MST beyond 80 days, compared to 25 days with CTLA-4Ig alone (p=0.0007). Monitoring OVA-specific cells revealed that this increased survival with dual therapy is accompanied by a reduction of antigen-specific CD8 T cells compared to CTLA-4Ig treatment alone (p= 0.0367 by unpaired t-test). This reduction of activated CD8 T cells was recapitulated in a full allograft model of skin graft with a 16% reduction in central memory CD8+ T cells in combination therapy versus CTLA-4Ig alone (p value = 0.0238). Further we show that the reduction in graft-specific T cells in the presence of CTLA-4Ig + TIGIT agonist compared to the individual therapies is due to an increase in cell death by measuring caspase 3/7 activity, and not changes in proliferative capacity of cytotoxic T cells by measurement of Cell Trace Violet dilutions. Using conditional knock out mice where TIGIT is specifically knocked out only in Foxp3 expressing cells, we show that the decrease in graft-specific CD8 T cell responses is dependent on TIGIT expressing Tregs.
Conclusions: Together, these data show that TIGIT agonism, when combined with CTLA-4Ig, can promote the death of CD8 T cells involved in allograft rejection in a Treg-dependent manner, improving skin graft survival outcomes in mice.

Abstract# 199

Donor-derived Cell-free DNA Distinguishes Acute Rejection from Other Causes of Graft Injury in Liver Transplant Recipients

J. Levitsky[1], M. Miller[2], R. Sinha[2], E. Bixler[2], A. Al-Turck[2], J. Weems[2], M. Altrich[2], S. Kleiboeker[2], M. Abecassis[3], *[1]Gastroenterology & Hepatology; Comprehensive Transplant Center, Northwestern University, Chicago, IL, [2]Viracor Eurofins, Lees Summit, MO, [3]University of Arizona College of Medicine Tucson, Tucson, AZ*

Purpose: The donor derived cell-free DNA (ddcfDNA) has emerged as strong biomarker for allograft injury, where the fraction of ddcfDNA is reported to increase in allograft rejection. Compared to other organ transplants, the fraction of donor-derived cell-free DNA (dd-cfDNA) in blood has not been tested robustly as an acute rejection (AR) biomarker in liver transplant recipients (LTR). Our aim was to evaluate the ability of dd-cfDNA to distinguish AR from other causes (ADNR - acute dysfunction no rejection) at the time of graft dysfunction.
Methods: Plasma tubes collected and stored from two LT biorepository cohorts (Northwestern University (NU); multicenter NIAID CTOT-14) were analyzed for ddcfDNA quantification. Patient phenotypes included AR (N=57), ADNR (N=68), control LT recipients with normal graft function (TX; N=94), as well as non-AR (combination of ADNR+TX; N=162). The sample set was randomly divided into discovery (70%, 153 samples) and validation (30%, 66 samples) sets, which were subsequently used to find and validate the optimal ddcfDNA cutoff, respectively.
Results: We have tested and validated the application of ddcfDNA fraction as a biomarker of liver graft injury in clinically relevant comparisons (AR vs. TX, AR vs. non-AR, AR vs. ADNR) (Table)

Clinical Groups	Optimal ddcfDNA in % (discovery)	Sensitivity (discovery)	Specificity (discovery)	AUC (discovery)	Sensitivity (validation)	Specificity (validation)	PPV/NPV (validation)
AR vs. TX	5.3	95 (83-99)	77 (64-86)	0.95 (0.92-0.99)	100 (79-100)	81(63-93)	62/100 (38-86)/ (88-100)
AR vs. non-AR	15.0	76 (66-88)	79 (70-86)	0.85 (0.78-0.91)	88 (62-98)	80(66-90)	59/95 (33-80)/ (83-99)
AR vs. ADNR	20.4	68 (52-82)	67 (52-80)	0.70 (0.61-0.80)	75 (48-93)	60(36-81)	38/88 (17-64)/ (65-99)

Conclusions: dd-cfDNA can distinguish AR from other causes of liver graft dysfunction using optimal cut-off fractions. Given the high NPV ("rule out" AR test), prospective studies are needed to evaluate its utility in clinical practice in reducing invasive liver biopsies performed to exclude rejection.

Abstract# 200

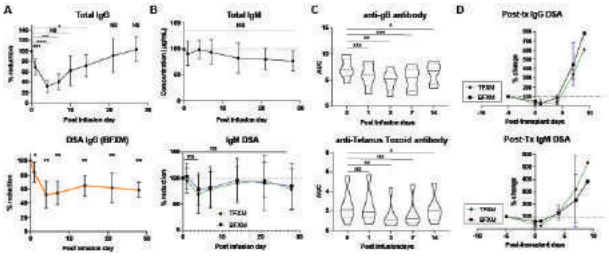
Measuring the Impact of Targeting FcRn-Mediated IgG Recycling on Donor-Specific Alloantibodies in a Sensitized NHP Model

M. Manook[1], W. Flores[2], R. Schmitz[1], Z. Fitch[1], J. Yoon[1], Y. Bae[1], B. I. Shaw[1], M. Harnois[3], S. Permar[3], A. Kirk[1], D. Magnani[2], J. Kwun[1], S. Knechtle[1], *[1]Duke Transplant Center, Duke University Medical Center, Durham, NC, [2]Massbiologics, University of Massachusetts Medical School, Boston, MA, [3]Human Vaccine Institute, Duke University Medical Center, Durham, NC*

Purpose: In transplantation, plasmapheresis and IVIg provide the mainstay of treatment directed at reducing or removing circulating donor specific antibody (DSA), yet both have limitations. We sought to test the efficacy of targeting the IgG recycling mechanism of the neonatal Fc receptor (FcRn) using anti-FcRn mAb therapy in a sensitized non-human primate (NHP) model, as a pharmacological means of lowering DSA.

Methods: Six (6) rhesus macaque monkeys, previously sensitized by skin transplantation, received a single dose of 30mg/kg anti-RhFcRn IV, and effects on total IgG, as well as DSA IgG measured, in addition to IgM and protective immunity. Subsequently, 60mg/kg IV was given in the setting of kidney transplantation from skin graft donors. Kidney transplant recipients received RhATG, and tacrolimus, MMF, and steroid for maintenance immunosuppression.

Results: Circulating total IgG was reduced from a baseline 100% on D0 to 32.0% (mean, SD ± 10.6) on d4 post infusion ($p<0.05$), while using a donor specific antibody (DSA) assay, B-cell FXCM to 52.2±19.3% **(Figure 1A)**. Circulating total IgM and DSA IgM were unaffected by treatment **(Figure 1B)**. Protective immunity (anti-gB and anti-tetanoid toxin IgG) was significantly reduced for 14d post infusion **(Figure 1C)**. Post-transplant, circulating IgG responded to anti-FcRn mAb treatment, but DSA increased rapidly **(Figure 1D)**.



Conclusions: Targeting the FcRn mediated recycling of IgG, is an effective means of lowering circulating donor specific IgG in the sensitized recipient, although in the setting of organ transplantation mechanisms of rapid antibody rise post-transplant remain unaffected.

Abstract# 201

Automated Electronic Donor Referrals Have Increased Transplantation

J. Piano, *Transplant Connect, Santa Monica, CA*

Purpose: It is well understood and supported by previous studies that costly inefficiencies exist in the current phone-based process by which hospitals refer potential donors to Organ Procurement Organizations (OPOs). Such costs include delays in notification as well as failures to refer altogether, preventing the donation and transplantation of life-saving organs. To address these challenges, a secure, automated and highly-replicable electronic donor identification and referral interface, known as *iReferral*, was developed and implemented to 1) automate the identification of potential donors by algorithmic referral triggers and 2) automate the hospital-to-OPO referral delivery, thereby eliminating the manual initial referral phone call and liberating hospital nursing resources.

Methods: The multi-disciplinary team collaborated to 1) design algorithmic referral triggers within the Hospital EMR and 2) develop a secure technical interface directly connecting the OPO and Hospital software systems. The referral triggers automatically identify potential donors and deliver electronic referrals from the Hospital EMR to the OPO software system based on hospital staff entry of pre-determined clinical data, alleviating nursing resources and eliminating the risk of missed referrals. The interface also includes a manual referral trigger for cases such as early family mention of donation. Upon receipt of the electronic referral, the OPO is able to retrieve critical donation screening details without disrupting the hospital staff. The first known interface of its kind, the pilot launched in October 2018 and has served as a model for many hospital networks and OPOs that have since implemented this replicable automated referral technology, known as *iReferral*.

Results: The interface led to significant increases in referrals, donations, and organ transplants at the pilot hospital (see figure). There are several case studies of the pilot OPO receiving an automatically triggered donor referral well before the nurse could call, allowing the OPO to mobilize and ultimately recover organs which likely would have otherwise timed out. Automated referrals have been met with near universal enthusiasm from clinical staff.

Conclusions: Continuing successful results have been achieved as a result of 1) defined algorithmic triggers for identifying potential donors and 2) the automated delivery of referrals via the secure Hospital-OPO interface. This project has eliminated costly inefficiencies and reduced burdens on both Hospitals and OPOs and has led to significant increases in the number and timeliness of referrals, directly resulting in increases in donation and transplantation.

Abstract# 202

The Initial Impact of Covid-19 on Reported Graft Failure Rates and Potential Confounding of Srtr Psrs

A. Wey[1], J. Miller[1], D. Musgrove[1], Y. Ahn[1], M. Valapour[2], N. Salkowski[1], M. Skeans[1], A. Massie[3], R. Hirose[4], D. Segev[3], A. Israni[1], J. Snyder[1], B. Kasiske[1], *[1]SRTR, Minneapolis, MN, [2]Cleveland Clinic, Cleveland, OH, [3]Johns Hopkins, Baltimore, MD, [4]Univ of California, San Francisco, San Francisco, CA*

Purpose: COVID-19 could bias the Scientific Registry of Transplant Recipients (SRTR) program-specific reports (PSRs), especially if its impact varied geographically.

Methods: Recipients who received transplants from January 1, 2000 to April 30, 2020 and had graft function on March 13, 2019 were included. To assess the risk of confounding, we estimated the overall and donation service area (DSA)-specific differences in graft failure rates from March 13, 2019 to March 12, 2020 compared with rates from March 13 to April 30, 2020, after adjusting for recipient and donor characteristics.

Results: Kidney, liver, and heart recipients had higher adjusted graft failure rates after COVID-19 than before (Figure 1). Graft failure rates for kidney and liver recipients who received a transplant in the New York City DSA were significantly higher after COVID-19 than before (Figures 2 and 3, respectively). Lung and heart transplant recipients had significantly less variability across DSAs.

Conclusions: Taken together, these results suggest potential confounding of SRTR PSRs, especially for kidney and liver transplant programs in the New York City DSA. Thus, SRTR is censoring transplant follow-up after March 12, 2020 for PSRs released in January 2021 to minimize potential bias. However, further studies are required to identity long-term solutions for minimizing potential confounding of SRTR PSRs by COVID-19.

Figure 1. The overall adjusted hazard ratios (aHRs) for graft failure after versus before COVID-19, adjusted for recipient and donor characteristics.

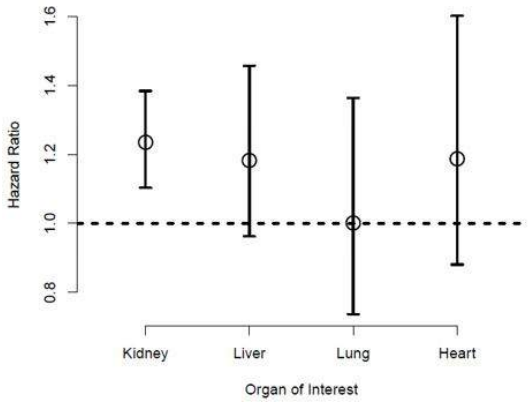

Figure 2. Kidney transplant: DSA-specific relative aHRs for graft failure before and after COVID-19.

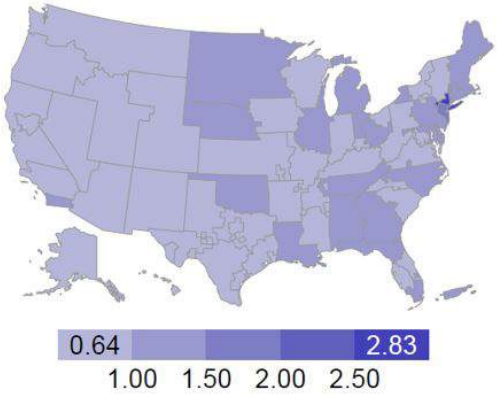

Figure 3. Liver transplant: DSA-specific relative aHRs for graft failure before and after COVID-19.

Abstract# 203

The Effect of Covid-19 on Offer Acceptance Rates by Age and Race Groups

A. Wey[1], J. Miller[1], Y. Ahn[1], D. Musgrove[1], A. Hart[1], N. Salkowski[1], M. Skeans[1], R. Hirose[2], A. Israni[1], J. Snyder[1], B. Kasiske[1], *[1]SRTR, Minneapolis, MN, [2]Univ of San Fransico, San Francisco, CA*

Purpose: COVID-19 causes more severe complications in older patients and disproportionately leads to poor outcomes in racial minorities. High offer acceptance rates indicate better access to transplant. Because access to transplant is critical for patients with end-stage organ failure, we investigated the effect of COVID-19 on offer acceptance rates by candidate age and race before and after the national emergency declaration on March 13, 2020 for kidney, liver, lung, and heart transplant.

Methods: We used match run data from March 13, 2019 to August 31, 2020 and included offers that resulted in at least 1 acceptance. Logistic regressions estimated differences in offer acceptance by candidate age and race before and after COVID-19 (i.e., the effects for age and race interacted with an indicator of donors recovered after March 12, 2020), and the regressions adjusted for the location of the offer in the match run and other candidate and donor characteristics.

Results: Overall, offer acceptance rates were lower for kidney, liver, and heart transplant after COVID-19 than before (Table 1). Differences in kidney offer acceptance across candidate age had a dose-response relationship: offer acceptance rates were higher in younger kidney candidates before and after COVID-19 than in older candidates. Offer acceptance rates for Black and Asian candidates decreased more before and after COVID-19 than for White candidates (Table 1). Offer acceptance rates for liver, lung, and heart candidates did not notably differ before and after COVID-19 by candidate age and race.

Conclusions: Thus, COVID-19 inequitably affected kidney offer acceptance rates across candidate age and racial groups.

Table 1. Adjusted offer acceptance rate ratios before and after the COVID-19 national emergency declaration on March 13, 2020 for overall and candidate age and race subgroups. For example, the change in the odds of acceptance before and after COVID-19 for kidney candidates aged 18 to 34 years was 14% higher than the change for kidney candidates aged 35 to 49.

Organ	Overall	Candidate age (Ref. = 35-49)			Candidate race (Ref. = White)

Abstract# 204

Covid-19 Impact of the Pandemic Surge on Patients Waiting for Renal Transplantation at a Single New York City Transplant Center

G. Boyd, D. Tsapepas, R. Bonifacio, L. Brinkers, C. Brennan, A. Chang, M. Dalangin, L. Lowe, J. K. Mendoza, J. V. Mendoza, C. McNulty, M. Morris, M. Muttiah, K. Nickason, L. Ratner, *Transplant, NYP - Columbia University Medical Center, New York, NY*

Purpose: There was a critical need to understand the impact that the COVID-19 pandemic had on our patients awaiting transplantation, including infection rates, morbidity, mortality, and wait list (WL) readiness.

Methods: Retrospective single-center study of active kidney and pancreas WL patients. Clinicians called patients using a questionnaire to assess patient status, screen for COVID-19 symptoms and exposures, assess changes to psychosocial demographics, and instruct patients who needed follow-up care.

Results: Active waitlist patients as of 4/2020 were contacted (Figure 1). Patients were stratified into 3 groups based on SARS-CoV2 testing: (1) No Test (NT) (n=357), (2) Test Neg (TNeg) (n=39), and (3) Test Pos (TPos) (n=30). Groups were similar at baseline, but differed with respect to ethnicity and diabetes status (Table 1). Black patients had a disproportionately higher rate of testing positive at 40% (n=12), even though as a group they represented 32% of our waitlist. Hispanic patients comprised 26% of the total WL patients, 43% of the COVID-19 positive patients were Hispanic. Diabetics had the highest rate of SARS CoV2 infection (p=0.02). Mortality due to COVID-19 among the WL population was 1.6% (n=7); of note, 2 additional patient deaths were reported to the center before the systematic WL calling process started. Patients who had known exposures to individuals with COVID-19 were more likely to have developed COVID-19 (p=0.001). Of the 30 TPos patients, 53% (n=16) had an exposure to a known COVID-19 infected person. This exposure was shown to be significant (p=0.001) for patients who ultimately tested positive for COVID-19. Symptoms among Tpos patients included fever (86%), body aches (68%), fatigue (64%) and cough (64%). Few patients (1%) reported changes to their social support, transportation access, and insurance coverage.

Conclusions: During the COVID-19 pandemic solid organ transplant candidates on the WL represent a vulnerable population as a result of their end stage organ failure, and co-morbid conditions. Our systematic phone call process of WL patients identified a 7% COVID-19 incidence, 1.6% mortality rate due to COVID-19, and a low number of patients experiencing changes to their readiness for transplant. More research is needed to identify trends among the transplant WL population. It is important to uncover any geographic or socioeconomic differences across transplant centers.

Abstract# 205

Impact of Lung Allocation Score Cohort Update

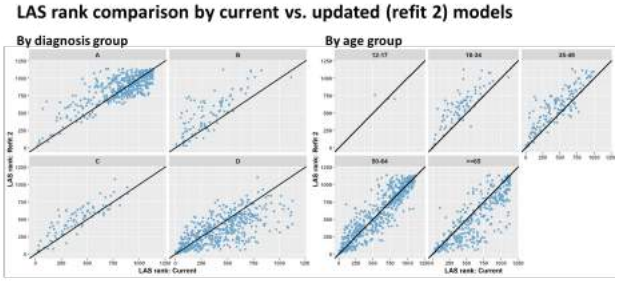
M. Skeans[1], A. Wey[1], E. Lease[2], C. Lehr[3], M. Valapour[3], *[1]SRTR, Minneapolis, MN, [2]Univ of Washington, Seattle, WA, [3]Cleveland Clinic, Cleveland, OH*

Purpose: The lung allocation score (LAS) was last revised in February, 2015, based on waitlist (WL) and posttransplant (PT) survival model cohorts from 2006-2008 and 2005-2008, respectively. The US policy goal of changing lung allocation to a continuous distribution framework precipitated the LAS cohort update.

Methods: Updated LAS WL and PT survival models used patients, March 1, 2015-March 31, 2018. Each population was followed for 1 year. Cox proportional hazards models were fit using the covariates of the current LAS. We fit 2 sets of models: (1) all current LAS covariates, and (2) those remaining after removing unstable and non-predictive covariates. We computed LAS from each set of models for a snapshot of 1136 waitlist patients aged ≥12 years, January 1, 2019. We compared their rank ordering under current and updated LAS.

Results: Updated models generated lower numbered ranks (increased access to transplant), for diagnosis group D and older candidates. In the updated cohort, adjusted risk of waitlist death was 4-fold higher for group D compared with group A, vs. 1.9-folder higher risk in the current model. The effect of age in the updated cohort was stronger than in the current cohort. Few patients aged <50 years had improved access with the updated LAS; most with improved access were aged ≥65 years (Figure). By diagnosis, only group D candidates experienced meaningfully improved access. Change in rank was examined for each removed covariate to determine if changes in transplant access changed due to newly excluded LAS variables. Removing diabetes status, cardiac index, central venous pressure, forced vital capacity, and functional status from the models had minimal impact on ranking. In our snapshot, <10 patients had obliterative bronchiolitis, serum creatinine increase of 150%, or bilirubin increase of 50%; impacts on these patients could not be generalized.

Conclusions: Since 2008, the proportion of older and group D patients on the lung transplant waiting list has increased. This is reflected in the changes in predictors of WL and PT survival. Updating models with recent cohorts provided increased access to transplant for these more acutely ill patients.



Dots below the 45 degree line represent candidates with increased access in updated (refit 2) vs. current models.

Abstract# 206

Effective Patient Throughput on the Transplant Surgery Service

E. M. Thomas[1], P. K. Shah[1], S. Beasley[2], A. Saad[1], M. Rani[1], F. Cigarroa[1], *[1]UT Health San Antonio, San Antonio, TX, [2]University Health, San Antonio, TX*

Purpose: Hospital bed capacity and patient throughput are persistent challenges for medical centers. One established strategy for increasing patient throughput and decompressing Emergency Departments is via discharge by noon (DBN) initiatives. However, hospitals are expected to both improve DBN without compromising readmission rates, length of stay (LOS) or patient experience. Additionally, services with complex patients and discharge planning are often considered incapable of success with such hospital metrics. In this study, we demonstrate how a transplant surgery service achieved this goal.

Methods: In February 2019, we implemented the "Power Through" initiative in the Transplant Surgery Service. Tools employed to improve DBN included weekday disposition meeting, weekday afternoon multidisciplinary patient discussion, all level education, leadership support and team buy-in. We compared the rate of DBN, readmission rate, LOS and patient satisfaction data pre-intervention (January 2018-January 2019) to post-intervention (February 2019-February 2020).

Results: We found that during pre-intervention phase 8.2% cases (42 of 513 cases) and post-intervention 35.8% cases (237 of 662 cases) achieved DB. This was a significant improvement (p-value < 0.001) with the post-intervention relative risk of discharge-by-noon being 4.37 times that of pre-intervention. The statistical process control charts showed a clear attributable variation associated with the intervention (fig b). Further, there was a significant (p-value < 0.001) shift in the density plot (fig a) showing early discharges. Our readmission rate decreased marginally from 22.2% to 20.5% with neither chi-square test nor statistical process control charts showing any significant difference. The overall mean LOS decreased from 7.54 to 6.98 while the LOS in the DBN cases increased from 4.98 to 5.20 days, both of which were insignificant (fig c and d). Lastly, the key domains of the HCAHPS survey pertaining to discharge information and communication showed regular month to month variation and no changes were attributed to the intervention (fig e).

Conclusions: With definitive, multi-level, multi-disciplinary and consistent efforts, we achieved significant improvement in DBN is our surgical service with complex patients who have complicated discharge needs. This improvement was sustained over a year and without harm or compromise to patient care. This achievement improved hospital throughput and cost savings.

Abstract# 207

The Learning Curve Associated with De Novo Tacrolimus XR Use in a Racially Diverse Kidney Transplant Population

F. Bartlett, T. Carcella, N. Patel, V. Rohan, D. Taber, *Medical University of South Carolina, Charleston, SC*

Purpose: Tacrolimus XR (LCP-Tac) was approved for de novo dosing in kidney transplant recipients in 2018. In 2020, our center was challenged with a nationwide shortage of tacrolimus IR, warranting implementation of a new de novo LCP-Tac protocol. The purpose of this study is to assess LCP-Tac outcomes with 3 initial dosing strategies in kidney transplant recipients
Methods: This was a retrospective longitudinal study of adult kidney recipients transplanted between May and September 2020. The study population was divided into 3 cohorts based on sequential de novo LCP-Tac dosing strategies: 0.12 mg/kg in all patients (cohort 1), 0.17 mg/kg in all patients (cohort 2), and most recently, 0.12 mg/kg in non-African Americans and 0.15 mg/kg in African Americans. The primary endpoints were days to achieve therapeutic level and time in therapeutic range (TTR) at 1-month post-transplant. Categorical data were analyzed using chi square or fishers exact. Continuous data were analyzed using Kruskal-Wallis.
Results: A total of 122 patients were included. Baseline characteristics were similar between cohorts. Cohorts 2 and 3 achieved a therapeutic level in roughly 3-4 days, compared to 6 days in cohort 1 ($p<0.01$) and 38% of cohort 1 did not achieve a therapeutic level by day 7 vs. 16-18% in cohorts 2 and 3 ($p=0.03$). TTR was slightly higher in cohort 3 (68%), as compared to cohorts 1 and 2 ((62-65%); $p=0.46$). There were more held doses in cohort 2 (60%). Other peri-operative outcomes were similar between cohorts, as were acute rejection rates and graft loss.
Conclusions: Using a stratified de novo LCP-Tac dosing strategy based on African-American race appears to strike the best balance between achieving therapeutic levels quickly after transplant while preventing giving too high of an initial dose. Studies determining the impact of CYP3A5 genotyping are ongoing and may help further clarify this dosing strategy.

	Cohort 1 N=39	Cohort 2 N=45	Cohort 3 N=38	P
TTR in month 1 (%), mean ± SD	62.1 ± 21.5	64.8 ± 22.4	68.3 ± 21.8	0.46
POD of first therapeutic level, median (IQR)	6 (4,9)	3 (3,5)	4.5 (3,7)	<0.01
>7 days to therapeutic level, N (%)	15 (38.5)	7 (15.6)	7 (18.4)	0.03
Not at stable therapeutic level by POD 30, N (%)	6 (15.4)	6 (13.3)	6 (15.8)	0.94
Stable mg/kg LCP-Tac dose, mean ± SD	0.16 ± 0.064	0.14 ± 0.057	0.12 ± 0.051	0.01
POD of stable therapeutic level, median (IQR)	13 (8,28.5)	14 (6,27)	12.5 (9,28.75)	0.79
Dose changes in month 1, mean ± SD	2.77 ± 1.09	3.47 ± 1.53	3.18 ± 1.63	0.09
Held doses, N (%)	13 (33.3)	27 (60)	16 (42.1)	0.04

Abstract# 208

Early Stent Removal in Kidney Transplant Recipients - A Quality Improvement Project

V. Rohan, N. Pilch, M. Altiti, S. Nadig, A. Lin, D. DuBay, P. Baliga, *Surgery, Medical University of South Carolina, Charleston, SC*

Purpose: Ureteric Stent placement is a is common practice at the time of kidney transplantation to reduce the incidence and severity of Major Urological Complications (MUC). The exact time required for the stent to be in place to prevent MUC is unknown. However, longer duration of stent placement is associated with urinary tract infections (UTI), hematuria and other irritative bladder symptoms. The **aim** of this process improvement project was to determine if earlier stent removal would decrease UTI rates without the increased risk of anastomotic complications.
Methods: In August 2019, timing of stent removal was moved from 6-8 weeks (Late) post-transplant to 3-4 weeks (Early). A retrospective review of adult, solitary kidney transplant recipients was performed. Urinary tract infections (UTI) occurring within the first 60 days post-transplant and readmissions secondary to UTI were collected. Urinary complications tracked included urine leak, ureteral stenosis or stricture requiring intervention and urinomas. Data were compared using descriptive statistics and were analyzed using SPSS v25.
Results: A total of 188 patients were transplanted between 8/16/19 and 3/25/20, 10 multi-organ recipients were excluded. Baseline demographics were similar between groups. **Only 3% (3/91) of patients with early stent removal (<30 days) experienced a UTIs prior versus 11% (10/86) in the late group (p=0.044).** These early UTIs required readmission in 6% (5/86) patients in the late group versus 1% (1/91) in the early group (p=0.198). There was no difference in urologic complications between early and late stent removal.
Conclusions: Early stent removal decreases UTIs and UTI related readmissions without increasing the rate of urologic complications

Table 1A: Baseline Patient and Transplant Demographics

	Early (n=91)	Late (n=86)	p-value
Pre-transplant on dialysis	71% (65)	82% (71)	0.11
Living donor	21% (19)	10% (9)	0.07
First week dialysis	26% (24)	27% (23)	0.545
Previous transplant	8% (7)	9% (8)	0.79
Female	48% (44)	58% (50)	0.45
Age (average±SD)	50±12	51±15	0.91

The Role of Notch2 in Antibody-mediated Alloimmune Response

R. Benedetti Gassen[1], N. Murakami[2], T. J Borges[1], A. Al Jurdi[1], A. Alessandrini[1], L. V Riella[1], *[1]Center of Transplantation Science, Massachusetts General Hospital, Boston, MA, [2]Brigham and Women's Hospital, Boston, MA*

Purpose: Antibody mediated rejection is the leading cause of chronic allograft rejection. Developing a novel therapeutic target to inhibit chronic rejection is an urgent need in the transplant field. Marginal zone (MZ) B cells are a B cell subset that play important roles in the immune response by the rapid generation of antibodies against blood borne pathogens but its roles in allograft humoral response is not fully

understood. Notch2 is a transmembrane receptor crucial for MZ B cell development. We hypothesized that anti-Notch2 treatment attenuates alloantibody response and increase graft survival through the modulation of MZ B cells and T follicular cells.
Methods: To investigate this hypothesis, we used a combination of models including: NP-OVA immunization in B6 mice, a BALB/c into B6 mice heart transplant model, and a sensitized skin transplant model. 5mg/kg of anti-Notch2 antibody or control IgG were administered i.p. every 2 days.
Results: In the NP-OVA immunization model, Notch2 blockade quickly depleted MZ B cells while increasing follicular regulatory T cells (Tfr), leading to a significant reduction in the generation of anti-NP IgG antibodies (Fig. 1 A, B). In a full MHC-mismatched cardiac transplant model, anti-Notch2 treatment was able to mitigate rejection and prolong graft survival (Fig 1. C, D), while decreasing allo-specific antibody production. Lastly, Notch2 blockade successfully impaired the recall of the humoral response after skin transplant in sensitized mice (Fig. 1 E, F).
Conclusions: Notch2 blockade is a promising approach to reduce alloantibody responses by inhibiting MZ B cells and expanding Tfr cells. Further elucidating the role of the Notch2 blockade in the prevention of antibody-mediated rejection will be a first step in the development of novel therapeutic strategies to more selectively target B cells and inhibit chronic antibody-mediated rejection.

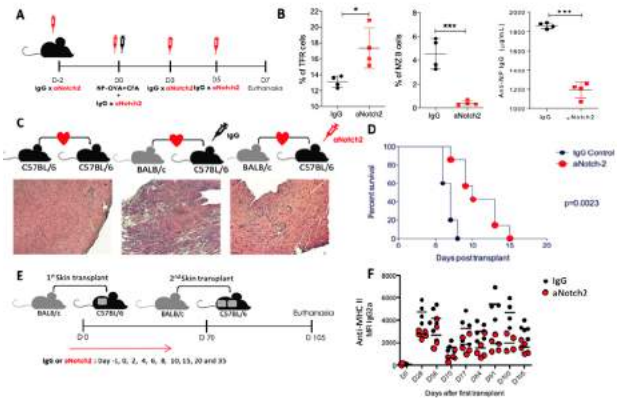

Figure 1. Anti-Notch2 treatment reduce MZ B cells numbers, antigen-specific antibody production and increase graft survival.

Abstract# 210

Marginal Zone B Cells Support Donor-Specific Alloantibody Responses to Heart Allografts

V. Gorbacheva, R. Fan, W. Baldwin, R. Fairchild, A. Valujskikh, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

Purpose: Production of high affinity isotype-switched donor specific alloantibodies (DSA) after transplantation is associated with germinal center formation by follicular (FO) B cells whereas the contribution of marginal zone (MZ) B cells is poorly understood. The goal of our study was to test the role of MZ B cells during alloimmune responses.
Methods: To evaluate MZ B cell responses after transplantation, B6.Blimp-1 (H-2^b) reporter mice were transplanted with BALB/c (H-2^d) heart allografts. To test MZ B cells contribution to DSA production we treated B6.WT recipients of BALB/c heart allografts with anti-mCD20 18B12 IgG1 mAb that depletes >95% splenic FO but only 40-60% MZ B cells. Serum levels of class I and class II-reactive IgG and IgM DSA were determined by ELISA. We used S1PR1 signaling inhibitor FTY720 to prevent MZ B cells from returning to MZ area. To specifically test the role of MZ B cells in DSA production we used $CD19^{Cre}Notch2^{fl/fl}$ mice (ΔMZB) with defective development of MZ B cells as heart allograft recipients. In addition, sera collected fromΔMZB recipients and littermate controls on d.14 posttransplant was transferred to $RAG1^{-/-}$ recipients of BALB/c heart allograft
Results: $Blimp1^{+}$ MZ B cells in recipient spleen peaked at d. 7 and declined by d. 14 posttransplant, suggesting their differentiation into early antibody secreting cells. Preferential FO B cell depletion reduced serum IgG DSA levels only at later time points (d. 14 and d. 21), indicating that early IgG DSA are produced by residual MZ B cells. CD4 T cells depletion prior to transplantation showed that these early MZ B cell responses were critically dependent on T cell help. Treatment of heart allograft recipients with FTY720 displaced MZ B cells from spleen MZ area and markedly impaired both class I and class II DSA generation. IgG and IgM DSA generation in ΔMZB recipients was significantly impaired compared to control littermates, even though the priming of donor-reactive IFNγ producing T cells was similar between groups. Transfer of littermate but not ΔMZB sera collected on d.14 posttransplant to $RAG1^{-/-}$ BALB/c heart allograft recipients induced C4d complement deposition, indicating that MZ B cells are required to generate high levels of complement-activating DSA.
Conclusions: Our findings are the first demonstration for the role of MZ B cells in humoral alloimmune responses following solid organ transplantation and identify MZ B cells as a potential therapeutic target for minimizing *de novo* DSA production and antibody-mediated rejection in transplant recipients.

Abstract# 211

Acoustofluidic Device to Remove Donor Specific Antibody in a Sensitized Animal Model

J. Kwun[1], E. David[2], Y. Gu[3], Z. Ma[3], M. Kuchibhatla[4], G. Arepally[5], T. J. Huang[3], E. T. Chambers[2], *[1]Surgery, Duke University, Durham, NC, [2]Pediatrics, Duke University, Durham, NC, [3]Biomedical Engineering, Duke University, Durham, NC, [4]Biostatistics and Bioinformatics, Duke University, Durham, NC, [5]Internal Medicine, Duke University, Durham, NC*

Purpose: Current therapies for antibody-mediated rejection are neither donor-specific nor are they tailored toward children, resulting in premature allograft loss and increased mortality. Apheresis involves a large machine for antibody removal that has been developed for adults, but its use in children is associated with hypotension, exposure to allergenic filters, and the need for blood transfusions with increasing sensitization risk. To overcome this limitation, we aim to develop a scalable device using acoustic sound waves and incorporation of donor antigen beads for the targeted removal of donor-specific antibody (DSA) in a rodent model with intended translation into children.
Methods: A 4 mm (length) x 0.075 mm (height) x 1 mm (width) acrylic, acoustofluidic (AF) device (Fig 1A) was used to separate unbound anti-rhesus CD3 antibody (Ab) from rat whole blood and DSA from a sensitized mouse at a blood flow rate of 10-20 ul/min, frequency of 19.9 MHz and voltage of 30. Antigen-coated beads were made by affixing FITC to poly-lysine coated carboxylated polystyrene microparticles (10 um) which were added to the AF device with rat plasma containing anti-mouse FITC IgG.
Results: Unbound anti-rhesus CD3 mAb is efficiently removed from rat whole blood using the AF device (Fig 1B). Moreover, DSA (red peak) is reduced by 50% (Fig 1C) after a single AF apheresis treatment in a sensitized mouse model. Additionally, the addition of antigen-coated beads to the AF device is associated with 80% reduction of mouse anti-FITC IgG from rat plasma (Fig 1D).
Conclusions: AF apheresis device using sound waves effectively separates antibody from other cellular components in small extracorporeal volumes (<10 ml) of whole blood and in a sensitized rodent model. Incorporation of antigen coated-beads allows the clearance of antibodies specific for the antigen from plasma through AF apheresis. This AF technology shows promise and can be scalable to large animals and small children.

Abstract# 212

Cd4 T Cells Can Trigger Nk-dependent Chronic Rejection Independent of Antibodies

R. G. Gill[1], B. Mehrad[2], C. M. Lin[2], *[1]Surgery, University of Colorado Denver, Aurora, CO, [2]Medicine, University of Florida, Gainesville, FL*

Purpose: In transplantation, recipient CD4+ T cells have two potential means of MHC class II-restricted donor antigen detection: (1) the direct recognition of allogeneic MHC class II expressed by donor antigen-presenting cells (APCs) and (2) the indirect recognition of donor antigens processed and presented by recipient APCs. Importantly, indirect CD4 T cells are essential helper cells for generating aa donor-specific antibody (DSA) response. DSA in turn can contribute to chronic graft injury. A clear role of direct CD4+ T cells as effector cells has been shown in acute rejection, however, the role of indirect CD4+ T cells in chronic rejection is less clear. The function of NK cells in solid organ transplantation is multifaceted, but they have been implicated in several different animal models of chronic rejection. Our study sought to test the hypothesis that indirect CD4 T cells can contribute to NK-dependent allograft vasculopathy (CAV) even in the absence of DSA.

Methods: We utilized a reductionist mouse model of cardiac transplantation with C57Bl/6 (B6) MHC class II-deficient (C2D) (H-2^b) hearts engrafted into immune-deficient BALB/c *rag1*$^{-/-}$ (H-2^d) recipients (because CD4 T cell cannot acutely reject heart allografts without donor MHC II expression) . Recipients had no functional adaptive immunity but an intact innate immune system. After transplantation, the recipients received purified polyclonal BALB/c CD4+ T cells with or without concurrent administration of an NK cell depleting antibody (anti-Asialo GM1). Donor CAV determined by morphometric analysis of vascular occlusion and cellular recipient spleen composition were subsequently 30 days post CD4 T cell transfer.

Results: Purified B6 CD4 T cells failed to acutely reject MHC class II-deficient heart allografts in BALB*rag1*$^{-/-}$ recipients. Only 1/9 (11%) of allografts from un-reconstituted recipients developed any evidence of CAV while 5/7 (72%) of allografts from recipients receiving purified CD4+ T cels showed significant disease (p less than 0.05). Administration of anti-Asialo GM1 led to near complete elimination of host splenic NK cells and this depletion of NK cells was found to abrogate the development of CAV triggered by CD4+ T cells in 4/4 recipients.

Conclusions: Indirect CD4 T cells are clearly linked to the generation of DSA. Results indicate that such CD4+ T cell reactivity can contribute to NK cell-dependent CAV, even in the absence of CD8+ T cell and B cell responses. As such, this represents an alternate form of CAV that can be antibody independent.

Abstract# 213

Blood Type A2/a2b to B Renal Transplantation: A Single Center Retrospective Cohort Study

V. S. Tatapudi, N. Alnazari, R. Chand, N. M. Ali, B. E. Lonze, R. A. Montgomery, *NYU Langone Transplant Institute, NYU Langone Health, New York, NY*

Purpose: Blood type B candidates on the deceased donor kidney waitlist have a lower transplantation rate and longer wait time than candidates of other blood types. The new national kidney allocation system (KAS), implemented in December 2014, prioritizes the allocation of kidneys from blood type A2 and A2B deceased donors to blood type B candidates to mitigate this disparity in access to transplantation. We analyzed our center's data to determine whether blood type A2/A2B to B transplantation is clinically feasible without the need for additional immunosuppression.

Methods: We conducted a single-center retrospective cohort study to analyze the utilization and outcomes in A2/A2B to B deceased donor renal transplants. Data on adult, kidney-only recipients were extracted with custom reports from the United Network for Organ transplantation (UNOS) portal. We used multivariable Cox-proportional hazards models to compare graft and patient survival in blood type A2/A2B to B deceased donor renal transplants to survival in blood type B to B transplants. We estimated Kaplan-Meier (KM) graft and patient survival functions.

Results: Since 2015, our center has performed 44 A2/A2B to B and 65 B to B kidney transplants. We followed the patients for a median of 712 days (IQR 343-1143). Recipients of A2/A2B to B and B to B kidney transplants were similar with respect to age, gender, estimated post-transplant survival (EPTS), calculated panel reactive antibody (CPRA), HLA ABDR mismatch, kidney donor profile index (KDPI), and the incidence of delayed graft function (DGF). A higher percentage of A2/A2B to B transplant recipients were Black/African American (22/44, 50%) than B to B transplant recipients (14/65, 21.5%). Blood type A2/A2B to B and B to B transplant recipients had similar 1-year graft (97.7% vs. 93.8%, p=0.34) and 1-year patient survival (97.7% vs. 98.5%, p=0.78) rates. Multivariable models adjusted for race/ethnicity showed that death censored graft survival (adjusted HR=1.45, p=0.70, 95% CI=0.21 to 9.82) and patient survival (4.22, p=0.14, 95% CI=0.64 to 27.92) in A2/A2B to B transplant recipients were similar to the traditionally ABO blood type compatible B to B transplants.

Conclusions: The NYU Langone blood type A2/A2B to B transplantation adds to the body of evidence suggesting that blood type A2/A2B to B transplantation is clinically feasible. This provision of the KAS appears to be having its intended effect of increasing access to transplantation in blood type B candidates with no attendant compromise in overall patient or death censored graft survival.

Abstract# 214

Low Immunogenic Donors Improve Kidney Transplant Survival in Sensitized Recipients

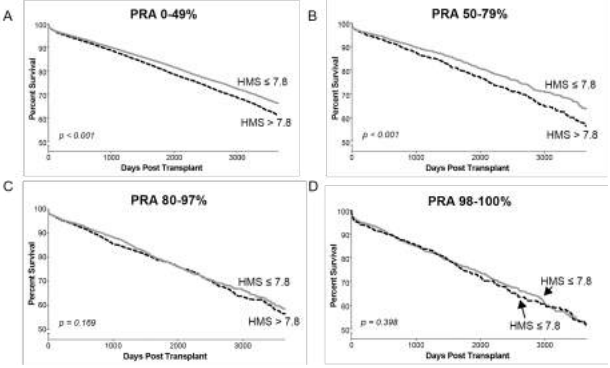
D. Bekbolsynov[1], R. Green[2], B. Mierzejewska[1], M. Rees[1], S. Stepkowski[1], *[1]University of Toledo, Toledo, OH, [2]Bowling Green State University, Bowling Green, OH*

Purpose: Our previous results showed that low immunogenicity (IM) donors improved kidney allograft survival in non-sensitized recipients. Herein, we examined how the level of peak pre-transplant panel reactive antibody (PRA=0-100%) may affect the beneficial impact of low HLA IM.

Methods: The donor/recipient IM was evaluated by the hydrophobic mismatch score (HMS) calculated from the hydrophobic charges of donor/recipient polymorphic amino acids. The 78,865 donor/recipient cohort (SRTR) was converted from 2- to 4-digit HLA-A/B/DR and the HMS calculated by the Cambridge algorithm. The HMS IM on a scale of 0-20 was correlated between four PRA groups (0-49%; 50-79%; 80-94%; and 95-100%) with Kaplan-Meier survival estimates and Cox regression analyses.

Results: Non-sensitized and weakly sensitized (PRA=0-49%) as well as mildly sensitized (PRA=50-79%) recipients showed an improved graft survival at different HMS thresholds, namely HMS=0, HMS≤3.0, and HMS≤7.8. In contrast, highly (PRA=79-97%) and very highly (HMS-98-100%) sensitized recipients had improved graft survivals only at HMS=0 and HMS≤3.0 but not at higher HMS thresholds (Fig. 1). The logistic regression analysis also demonstrated the impact of PRA on IM defined by the HMS thresholds when measured by the incidence of rejection. Lowering HMS threshold also compensated the impact of higher PRA values based on the number of early acute rejection episodes (Table 1). This HMS threshold had significant impact on graft survival at PRA 0-49% (p<0.001), while it became less significant at PRA 50-97% (p<0.05) and became non-significant at PRA 98-100% (p=NS).

Conclusions: Low IM (confirmed by lower HMS thresholds) significantly improved graft survivals and reduced number of rejection episodes in sensitized patients. Thus, the negative PRA effect on graft outcomes may be improved by adjusting the HMS IM thresholds.



Impact of different PRA levels on incidence of acute rejection			
PRA %	p-value in logistic regressoin		
	HMS≤7.8	HMS≤3.0	HMS=0
0-49	0.0001	0.0001	0.0001
50-79	0.0002	0.0001	0.0001
80-97	NS	0.0020	0.0010
98-100	NS	0.0100	0.0500

Abstract# 215

Association Between HLA Class II and TLR4 Regulates HLA-II Stimulated P-selectin Expression and Monocyte Capture to Endothelial Cells

Y. Jin, J. Nevarez-Mejia, E. F. Reed, *Pathology and Laboratory Medicine, University of California Los Angeles, Los Angeles, CA*

Purpose: Antibody-mediated rejection (AMR) is a major obstacle for long-term allograft survival. Donor specific HLA antibodies (DSA) contribute to the process of AMR by binding to HLA molecules on endothelial cells (EC) and triggering intracellular signal networks leading to EC activation and microvascular inflammation. However, the mechanisms underlying how HLA-II Ab elicit intracellular signals causing activation of vascular EC are poorly understood. Although HLA-II molecules lack signaling motifs and kinase activity in their short cytoplasmic tail, previous studies reported that MHC class II molecules interact with TLR4 to promote immune responses. We therefore postulated that HLA-II associates with TLR4 to transduce signals leading to EC activation, P-selectin expression and monocyte recruitment to EC.
Methods: HLA-II molecule expression on primary human aortic EC was induced using recombinant adenovirus pAd/PL-DEST encoding CIITA (Ad-CIITA) an HLA-II transactivator, or pretreated with TNF-α/IFN-γ. HLA-II expression was measured by flow cytometry. HLA-II:TLR4 complex formation was determined by stimulating EC with F(ab')2 fragments of anti-HLA-II mAb, cell lysates were immunoprecipitated with HLA-II Ab and complex formation was detected by Western Blot. Gene silencing was performed by siRNA transfection. P-selectin expression was detected by cell-based ELISA. Monocyte adhesion to EC measured by fluorescence microscopy and analyzed with CellProfiler.
Results: Infection of EC with Ad-CIITA or pretreatment of EC with TNF-α and IFN-γ induced a marked increase in HLA-II antigen expression. Ligation of HLA II on EC with antibody triggered molecular association between HLA II and TLR4, stimulated phosphorylation of key signal molecules in the TLR4 pathway including JNK, P38, ERK, and NF-kB. Knockdown of TLR4 or MyD88 with siRNA in EC, but not TRIF siRNA, abrogated the ability of HLA-II to stimulate phosphorylation of these kinases, P-selectin expression and monocyte recruitment.
Conclusions: These results indicate a mutual dependency between HLA II and TLR4 to stimulate EC P-selectin expression and monocyte recruitment, which may be important in promoting AMR and transplant vasculopathy. Our results provide a novel mechanism for HLA-II Ab-mediated alterations in EC and suggest that disrupting HLA II: TLR4 interactions may be required to achieve optimal efficacy in controlling HLA II Ab-mediated AMR.

Abstract# 216

Risk Stratification of Kidney Transplant Patients According to the Different Level of HLA-DQ Disparities

A. Senev[1], A. R. Tambur[2], M. Naesens[1], *[1]Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium, [2]Northwestern University, Chicago, IL*

Purpose: It is becoming clear that de novo donor-specific antibodies (*dn*DSA) against HLA-DQ are the most prevalent and the leading cause of chronic antibody-mediated rejection and poor allograft outcome after kidney transplantation. A well-known problem with the most HLA matching approaches is that they don't include systematic genotyping of HLA-DQ locus. Herein we evaluate the role of HLA-DQ matching at antigen, allele and haplotype levels to minimize the generation of HLA-DQ-*dn*DSA and improve graft outcome in kidney transplantation.
Methods: All adult patients who underwent kidney transplantation between 2004 and 2013 at a single center, with available DNA samples were included in this study (N=926). Each transplant pair was retrospectively genotyped at the 2nd field HLA level for HLA-DQA_1 and HLA-DQB_1.
Results: The mean follow-up time of this kidney transplant cohort was 7.62 ± 3.78 years. 152 patients (16.4%) experienced graft failure during this period. HLA-DQ *dn*DSA occurred in 23 of 889 patients with antibody follow-up data within the first ten years. **Figure 1** depicts the 10-year graft survival Kaplan-Meier curves according to the different levels of HLA-DQ MM. The 10-year survival rates were not statistically different between the groups with 0, 1 and 2 DQ antigen MM (80.4%, 77.7% and 74.3% respectively, p=0.27). In contrast, the different degrees of allele mismatches for the DQB_1 locus provided better risk stratification of the patients (82.8% with 0 DQB_1 MM, 78.6% with 1 DQB_1 MM and 70.0% with 2 DQB_1 MM, p=0.04). Next, we calculated the mismatches in the DQα/β pairs by considering DQA_1 at the 1st and DQB_1 at the 2nd field HLA genotyping level. The Kaplan-Meier curves showed that primarily the degree of mismatches for DQα/β haplotypes associated with the risk of graft failure after kidney transplantation (83.0% with 0 DQα/β MM, 78.7% with 1 DQα/β MM and 69.4% with 2 DQα/β MM, p=0.02). Finally, the patients with both matched DQα/β haplotypes had 100% DQ dnDSA-free survival compared to the decreased DQ *dn*DSA-free survival in patients with one (95.1%) or both (87.1%) mismatched DQα/β haplotypes (p=0.006).
Conclusions: By comparing the HLA-DQ mismatches at antigen, allele and haplotype levels, we found that DQα/β haplotype mismatch analysis provides the best risk stratification of the kidney transplant patients. These findings indicate that adding DQα/β haplotype matching to the current antigen HLA-A, -B, or -DR matching algorithm will decrease *de novo* formation of HLA-DQ antibodies and improve graft survival after kidney transplantation.

Figure 1. Kaplan-Meier estimates of 10-year kidney graft outcome according to the different levels of HLA-DQ mismatches.

Abstract# 217

Use of a Novel Bead-based Assay to Measure the Impact of Imlifidase on ABO IgG Antibodies

A. Halpin[1], B. Motyka[2], T. Ellis[2], J. Pearcey[2], T. L. Lowary[3], A. Runström[4], L. Winstedt[4], R. Bockermann[4], S. Järnum[4], A. Robertson[4], L. J. West[5], *[1]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta and Alberta Precision Laboratories, Edmonton, AB, Canada, [2]Department of Pediatrics, University of Alberta, Edmonton, AB, Canada, [3]Department of Chemistry, University of Alberta, Edmonton, AB, Canada, [4]Hansa Biopharma, Lund, Sweden, [5]Department of Pediatrics and Laboratory Medicine and Pathology, University of Alberta, Edmonton, AB, Canada*

Purpose: The accurate assessment and measurement of ABO antibodies (ABO-Ab) is a critical component of ABO-incompatible (ABOi) transplantation. ABO-Ab comprise both IgG and IgM, which are not readily distinguished by current hemagglutination (HA) methods and may not respond equally to Ab removal strategies. Imlifidase cleaves IgG, which prevents Fc-mediated effector functions. The majority of HA assays used clinically are not suitable for measuring the impact of imlifidase treatment since most are not Fc-specific and may include antibody-based reagents that can be cleaved by remaining imlifidase in the sample. Our aim was to assess the impact of imlifidase treatment using our novel bead-based assay to measure IgG and IgM ABO-Ab.

BASIC

Methods: Using Luminex single antigen beads, subtype-specific IgG and IgM ABO-Ab, expressed in mean fluorescence intensity (MFI), were measured in adult controls (n=75). ABO-Ab were compared before and after imlifidase treatment in healthy adult sera treated *in vitro* with imlifidase (n=8) and in sera from healthy volunteers treated with imlifidase, 0.25 mg/kg (18-HMedIdeS-15, n=11).
Results: IgG and IgM ABO-Ab quantities vary widely in healthy individuals and include high MFI ABO-Ab (Fig 1A). *In-vitro* and *in-vivo* treatment with imlifidase effectively reduced MFI signal for IgG ABO-Ab (Fig 1B, 1C). IgM ABO-Ab MFI signal was unaffected.
Conclusions: This novel bead-based assay enables measurement of both IgM and IgG ABO-Ab and facilitates evaluation of the role of isotypes in ABOi transplantation. ABO-Ab isotype differentiation may be particularly relevant in the context of plasmapheresis, commonly used in ABOi transplant, which more efficiently removes IgM Ab than IgG. HA has limitations in monitoring the effectiveness of imlifidase treatment but this bead-based antibody assessment adequately measures the effect of imlifidase and may provide a tool to clarify if there is a role for imlifidase in ABOi transplantation in individuals with high levels of ABO IgG Ab. Future studies will explore the use of a C1q-binding ABO assay to detect possible interference of single-cleaved IgG.

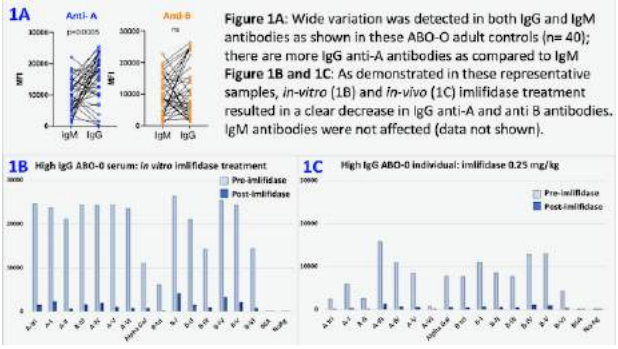

Figure 1A: Wide variation was detected in both IgG and IgM antibodies as shown in these ABO-O adult controls (n= 40); there are more IgG anti-A antibodies as compared to IgM
Figure 1B and 1C: As demonstrated in these representative samples, *in-vitro* (1B) and *in-vivo* (1C) imlifidase treatment resulted in a clear decrease in IgG anti-A and anti B antibodies. IgM antibodies were not affected (data not shown).

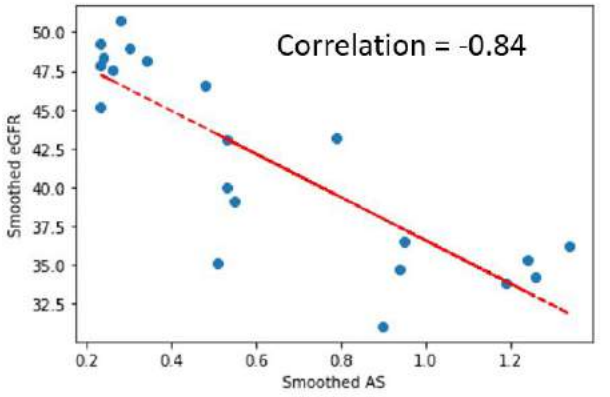
Abstract# 218

High Levels of Donor-Derived Cell-Free DNA Predict EGFR Decline After Kidney Transplantation

T. Alhamad[1], V. Bowers[2], E. Stites[3], S. Anand[4], J. S. Bromberg[5], H. Murad[1], G. Gupta[6], I. Moinuddin[6], L. Bu[7], S. Ghosh[8], J. Zeng[8], A. Pai[9], *[1]Washington University in St. Louis, St. Louis, MO, [2]Tampa General Hospital, Tampa, FL, [3]University of Colorado, Aurora, CO, [4]Intermountain Medical Center, Murray, UT, [5]University of Maryland School of Medicine, Baltimore, MD, [6]Virginia Commonwealth University, Richmond, VA, [7]University of Minnesota, Minneapolis, MN, [8]CareDx, Brisbane, CA, [9]University of Texas McGovern Medical School, Houston, TX*
Purpose: Persistent, low-grade inflammation is associated with decline in eGFR. Cross-sectional studies have demonstrated a consistent association between circulating inflammatory markers and kidney function. Our objective was to assess whether donor-derived cell-free DNA (dd-cfDNA) as a marker of injury and inflammation is independently associated with longitudinal kidney transplant (KT) function decline.
Methods: 1092 patients (2873 visits) were examined from the Assessing dd-cfDNA monitoring insights of renal allograft with longitudinal surveillance (ADMIRAL study; clinicaltrials.gov: NCT04566055219). Patients had dd-cfDNA (AlloSure®; CareDx, Inc.) during post-KT surveillance. Clinical events and Quant- BK PCR were monitored. High dd-cfDNA was defined as >0.5% based on analysis in ADMIRAL. K-means Clustering - an unsupervised machine learning algorithm was used to partition patients into similar clusters using key features such as race, gender, age at transplant, BK, dd-cfDNA, DSA and creatinine; reducing cohort to 219 patients. Intra-cluster noise reduction applied to only include patients with Δdd-cfDNA >60%. Each patient time-line weighted moving average (WMA) was applied to smooth eGFR and dd-cfDNA estimates.
Results: K-means yielded 4 distinct clusters representing mean time post-KT of 4 months, 1, 3 and 10 years; frequency of patient visits ranged from 2-14. Over 1st year post-KT, there was a slight negative correlation for dd-cfDNA and eGFR (R:-0.11); however, there was a more significant decline over the initial 3-years (R:-0.84) (**FIGURE 1**). The 10-year cluster included a single patient, but manifested identical trend (R :-0.69).

FIGURE 1 – eGFR decline over the initial 3-yrs post-KT



Conclusions: Although allograft dysfunction remains multifactorial, a high dd-cfDNA (>0.5%) level is associated with eGFR decline over the initial 3-years post-KT. Persistently elevated dd-cfDNA, a marker of injury and molecular inflammation, may indicate an increased risk of eGFR decline, thereby extending its utility beyond mere detection of acute clinical events. Therefore, dd-cfDNA surveillance after KT may add value to risk-stratify patients when considering long term outcomes and adjunctive therapies.

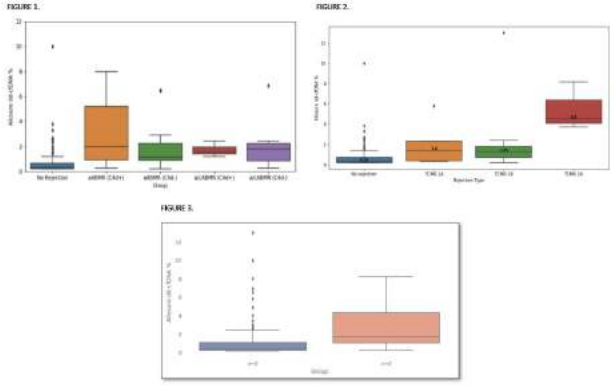
Abstract# 219

Assessment of Donor-Derived Cell-Free DNA Performance Characteristics Across the Spectrum of TCMR and ABMR After Kidney Transplant

L. Bu[1], S. Anand[2], A. Pai[3], J. S. Bromberg[4], T. Alhamad[5], V. Bowers[6], I. Moinuddin[7], S. Ghosh[8], W. Tian[8], E. Stites[9], G. Gupta[7], *[1]University of Minnesota, Minneapolis, MN, [2]Intermountain Medical Center, Murray, UT, [3]University of Texas McGovern Medical School, Houston, TX, [4]University of Maryland School of Medicine, Baltimore, MD, [5]Washington University in St. Louis, St. Louis, MO, [6]Tampa General Hospital, Tampa, FL, [7]Virginia Commonwealth University, Richmond, VA, [8]CareDx, Brisbane, CA, [9]University of Colorado, Aurora, CO*
Purpose: Different donor-derived cell-free DNA (dd-cfDNA) thresholds have been reported in association with varying TCMR, ABMR and "Borderline" diagnoses. Interpretation of dd-cfDNA levels spanning active (aABMR) and active-chronic (a/cABMR) is further complicated by presence *or* absence of C4d staining. We hypothesized that dd-cfDNA levels would complement the pathologic diagnoses.
Methods: Patients from the Assessing dd-cfDNA monitoring insights of renal allograft with longitudinal surveillance (ADMIRAL study; clinicaltrials.gov: NCT04566055219) were analyzed with a total of 219 biopsies (Bx), centrally

interpreted with Banff Categorical and lesion scores, with paired plasma dd-cfDNA (AlloSure®; CareDx) from 196 patients (110 "for cause", 109 "surveillance"). Samples were considered if Bx performed ≤ 20 days after dd-cfDNA level.

Results: In analyzing ABMR [FIGURE 1], all aABMR and a/cABMR were associated with significant elevation in dd-cfDNA levels compared to Normal Bx (N=111) median dd-cfDNA level of 0.29% ─ aABMR (C4d+) median: 2.0% (N=12; P=4.9e-05), a/cABMR (C4d+): 1.15% (N=16; P=3.3e-05), aABMR (C4d-): 1.6% (N=8; P=3.2e-04), a/cABMR (C4d-): 1.8% (N=11; P=3.3e-04). No dd-cfDNA difference was observed between C4d+ and C4d- ABMR. No difference in dd-cfDNA levels was observed between ABMR with or without transplant glomerulopathy. For TCMR [FIGURE 2], dd-cfDNA levels were significantly elevated, compared to Normal Bx, for Grade 1A: 1.4% (N=5; P=0.04), 1B: 1.25% (N=8; P=0.01) and 2A: 4.5% (N=3; P=0.003). Intimal arteritis (v) [FIGURE 3] was independently associated with elevated dd-cfDNA levels for v(0) median dd-cfDNA: 0.385% (N=240) and v(>0): 1.7% (P=0.0007).



Conclusions: dd-cfDNA levels were elevated across the spectrum of active and active-chronic ABMR, regardless of C4d status. Although a rather small 'N' for active TCMR cohorts by Grade, there were statistically elevated dd-cfDNA levels and 'trend' for correlation for Grade 2A however no difference observed between Grades 1A and 1B. Elevation in dd-cfDNA levels reflected vascular injury in the context of *Intimal arteritis* (v) lesions.

Abstract# 220

Intrarenal B-cell Activating Factor (BAFF) Levels are Increased in Transplant Glomerulopathy

S. Panzer, K. Swanson, G. Pandya, L. Hidalgo, S. Reese, *University of Wisconsin Madison, Madison, WI*

Purpose: Transplant glomerulopathy (TG), a key feature of chronic active antibody-mediated rejection (caABMR), is associated with allograft failure. B-cell activating factor (BAFF) is a cytokine integral to B cell function and survival. In several diseases, such as lupus nephritis, intrarenal BAFF levels correlate with renal disease activity. We hypothesized renal tissue BAFF levels are increased in TG and are associated with allograft failure.

Methods: Kidney transplant recipients that underwent biopsy between 2014-2015 and had a diagnosis of TG (cg score ≥1a) were compared to a group of controls (negative for rejection). The TG cohort was further stratified into 3 subgroups, based on Banff 2019 criteria: caABMR, chronic inactive ABMR (ciABMR), or terminal TG (chronicity score ≥ 8). Tissue BAFF staining was measured by densitometry and reported as percent area. Allograft failure was defined as re-transplant, return to dialysis, or death.

Results: Of the 120 recipients in the study, 82 (68%) had graft failure over a median follow-up of 2.8 years after biopsy. Patients with TG (n=106) versus controls (n=14) had a higher rate of allograft failure (70% vs 32%, P=0.02) and higher intrarenal BAFF levels (2.39 ± 0.34% vs 0.76 ± 0.09%, P=0.015, Figure 1A). At biopsy, the TG group had more proteinuria compared to controls (1.5 ± 1.8 vs 0.2 ± 0.1 g/g, P<0.001), and more DSA, particularly class II DSA (54% vs 16% were positive for class II DSA, P<0.001). There were significant differences in tissue BAFF levels when stratified by TG subgroup: caABMR 1.33 ± 0.33%, ciABMR 1.50 ± 0.33%, and terminal TG 2.53 ± 0.39% (1-way ANOVA P=0.003, Figure 1B). Intrarenal BAFF levels correlated with tubular atrophy (R^2=0.52, P<0.0001) and interstitial fibrosis (R^2=0.50, P<0.0001), but not microvascular inflammation (Figure 1C). On univariate analysis, intrarenal BAFF was not associated with risk of graft failure/death (HR=1.05 (95% CI 0.61-1.79), P=0.8). On multivariate analysis, cg score (aHR 1.44 (95% CI 1.08-1.92), P=0.01), proteinuria (aHR 1.22 (95% CI 1.04-1.43), P=0.01), and serum creatinine at biopsy (aHR 2.18 (95% CI 1.64-2.89), P<0.0001) were associated with graft failure/death.

Conclusions: Tissue BAFF levels are increased in transplant glomerulopathy, but were not associated with allograft failure or death. These findings suggest a role for BAFF in renal injury and TG. As anti-BAFF therapeutics are now clinically available, further studies are needed to evaluate BAFF levels in the circulation and lymphoid tissues in transplant recipients and its impact on B cell populations, DSA, and ABMR.

Abstract# 221

Utility of Non-Invasive Rejection Biomarkers to Guide Immunomodulation in Kidney Transplant Patients with Active Covid-19 Infection

J. Christensen, G. Gupta, A. Bryson, S. Paluri, R. Thompson, S. Sterling, N. Vissichelli, P. Kimball, D. Kumar, *VCUHealth, Richmond, VA*

Purpose: Treatment of Coronavirus Disease 2019 (COVID-19) infection in organ transplant recipients has involved reduction of immunosuppression (IS). It is plausible that the cytokine release syndrome associated with COVID-19 coupled with reduction in IS may predispose transplant patients to rejection.

Methods: Since March 2020 we initiated a protocol of measuring donor derived cell free DNA (ddcfDNA) (Allosure, CareDx) and HLA DSA at the time of diagnosis of COVID-19 infection (prior to reduction or cessation of antimetabolite). ddcfDNA, HLA DSA and additional clinical markers of allograft function were serially monitored until the point of nasopharyngeal (NP) swab clearance of COVID-19.

Results: Thirty three transplant recipients were included, the majority were kidney only (KT) (31/33; 94%) and the other two were simultaneous liver kidney transplant (SLK) recipients. Most were African American (23/33, 70%) with deceased donor transplants (25/33; 76%) and underwent induction with rabbit anti-thymocyte globulin (31/33, 94%). Baseline IS included mycophenolate in 32/33 (97%) patients. Patients presented with COVID-19 at a median of 57 months (Range: 1-182) post transplant. Antimetabolite was stopped in 20/33 (61%) patients while it was reduced in the others (13/33; 39%). Mean ddcfDNA at diagnosis was 0.45±0.39% in the KT recipients. In the two SLK recipients the values were 4.8% and 6.4% (below the cut off of 10% to detect rejection in liver transplants). Nineteen (58%) patients underwent

repeat ddcfDNA testing at a median follow-up of 20 days (Range 14-127). In these recipients the ddcfDNA did not change from 0.44±0.37% to 0.30±0.36% (p=0.172). At a median NP swab clearance of 41 days (Range: 20-128), the mean eGFR at diagnosis was 57.9±30.5 ml/min/1.73m^2 and remained unchanged at 57.4±29 ml/min/1.73m^2. Three KT recipients had an initial ddcfDNA of greater than 1%, two of these had pre-existing chronic active ABMR. One patient had a value greater than 1%, who then underwent a biopsy for new low grade class II DSA after his NP swab cleared and had early evidence of transplant glomerulopathy without active microvascular inflammation. Twenty-nine patients (88%) did not have any HLA DSA at the time of diagnosis and only one developed de-novo HLA DSA during infection. Four (12%) sensitized patients had pre-formed HLA DSA at the time of diagnosis and during the infection with reduced IS there were no new DSA.

Conclusions: In the setting of active Covid-19 infection, we report the utility of ddcfDNA, a validated biomarker of immunological graft injury as a non-invasive tool to monitor allograft function while allowing for reduction in IS. In the majority of patients, ddcfDNA was low initially and remained low on subsequent testing arguing against allograft injury. In addition despite reduced IS, COVID-19 infection did not stimulate alloimmune responses in the short-term as evidenced by a very low rate of de-novo DSA.

Abstract# 222

The Role of Donor-derived Cell-free DNA to Detect Subclinical Acute Rejection in Kidney Allograft

S. Park[1], K. Guo[2], R. Heilman[3], E. Poggio[4], D. Taber[5], C. Marsh[6], S. Kurian[7], S. Kleiboeker[8], J. Weems[9], J. Holman[10], L. Zhao[2], R. Sinha[8], S. Brietigam[2], C. Rebello[2], M. Abecassis[11], J. Friedewald[1], *[1]Transplant nephrology, Northwestern University, Chicago, IL, [2]Feinberg School of Medicine, Northwestern University, Chicago, IL, [3]Transplant nephrology, Mayo Clinic College of Medicine and Science, Phoenix, AZ, [4]Department of Nephrology and Hypertension, Cleveland Clinic, Cleveland, OH, [5]Division of Transplant Surgery, Medical University of South Carolina, Charleston, SC, [6]Department of Medicine and Surgery, Scripps Clinic and Green Hospital, La Jolla, CA, [7]Scripps Health, La Jolla, CA, [8]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [9]Eurofins US Clinical Diagnostics, Lee's Summit, MO, [10]Transplant Genomics, Inc, Mansfield, MA, [11]University of Arizona College of Medicine, Northwestern University, Tucson, AZ*

Purpose: We hypothesized that donor-derived cell-free DNA (dd-cfDNA) could detect subclinical acute rejection (subAR).

Methods: 429 blood samples paired with surveillance kidney biopsies from 208 patients with stable kidney function were analyzed. We used a commercially available dd-cfDNA assay, which provides a percentage of dd-cfDNA over total cfDNA. More than 0.7% of dd-cfDNA was reported as positive results. Sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) were assessed. 95% confidence interval (CI) was calculated using bootstrapping with 10,000 iterations.

Results: 429 samples consisted of 80.7% (n=346) with Transplant eXcellence (TX, no rejection) and 19.3% (n=83) with subAR. Among 83 subAR, 61.4% (n=51) were borderline, 32.5% (n=27) were antibody-mediated rejection (AMR) and 6% (n=5) Banff 1A rejection. The dd-cfDNA had sensitivity of 41% (95% CI, 0.28-0.54) and specificity of 85% (95% CI, 0.80-0.90). The PPV and NPV were 40% (95% CI, 0.27-0.52) and 86% (95% CI, 0.82-0.90), respectively (Table 1). The median dd-cfDNA in the subAR group (0.43%) was significantly higher than the TX group (0.31%, p<0.001) (Figure 1). The AMR group (2.29%) had significantly higher median than the acute cellular rejection (ACR) group (0.35%, p <0.001) or Tx group (0.31%, p<0.001) (Figure2). The dd-cfDNA was positive among 88.9% (n=24) of 27 AMR samples.

Conclusions: The dd-cfDNA assay was able to detect 88.9% of subclinical AMR cases but was not as discriminatory for subclinical ACR.

Table 1) Dd-cfDNA Performance

N=429	Actual rejection (n=83)	Actual no rejection (n=346)	
Predicted rejection (n=86)	True positive (n=34)	False positive (n=52)	PPV = 0.40 (95% CI, 0.27-0.52) Prevalence-adjusted PPV =0.41 (95% CI, 0.31-0.51)
Predicted no rejection (n=343)	False negative (n=49)	True negative (n=294)	NPV = 0.86 (95% CI, 0.82-0.90) Prevalence-adjusted NPV= 0.85 (95% CI, 0.82-0.88)
	Sensitivity = 0.41 (95% CI, 0.28-0.54)	Specificity = 0.85 (95% CI, 0.80-0.90)

Abstract# 223

MDR-101-MLK-MERCURY Kidney Transplant Tolerance Study Update

D. Kaufman[1], S. Akkina[2], M. Stegall[3], J. Piper[4], A. O. Gaber[5], E. Marin[6], S. Busque[7], D. Alonso[8], M. De Vera[9], A. Shah[10], A. Patel[11], K. Chavin[12], M. Laftavi[13], S. Collette[14], E. Stites[15], M. Mai[16], M. Cooper[17], D. Brennan[18], *[1]Surgery, UW, Madison, WI, [2]Surgery, Loyola, Chicago, IL, [3]Surgery, Mayo, Rochester, MN, [4]Surgery, Inova, Fairfax, VA, [5]Surgery, Houston Methodist, Houston, TX, [6]Nephrology, Yale, New Haven, CT, [7]Surgery, Stanford, San Francisco, CA, [8]Surgery, Intermountain, Murray, UT, [9]Surgery, Loma Linda, Loma Linda, CA, [10]Surgery, TJU, Philadelphia, PA, [11]Nephrology, St. Barnabas, Livingston, NJ, [12]Surgery, UHH, Cincinnati, OH, [13]Surgery, Upstate, Syracuse, NY, [14]Surgery, CIUSSS, Montreal, ON, Canada, [15]Nephrology, UC Denver, Denver, CO, [16]Nephrology, Mayo - FL, Jacksonville, FL, [17]Surgery, Georgetown, Washington, DC, [18]Medeor, San Francisco, CA*

Purpose: We report interim results of the Phase 3 MERCURY tolerance study, which produces mixed chimerism and ultimately generates operational tolerance allowing for the elimination of all IS therapy. The randomized, multi-center study evaluated the functional immune tolerance in MDR-101 recipients of HLA-matched living donor (LD) kidney transplants as compared to standard of care (SOC) (NCT03363945).

Methods: Eligible adult, donor/recipient (D/R) pairs of a first kidney allograft from an HLA-identical LD were enrolled and randomized 2:1 to either the Investigational Arm (IA; n=20) or Control Arm (CA; n=10). Donors in the IA received G-CSF for 5 days before undergoing apheresis. The donor peripheral CD34+ and CD3+ cells were processed to produce the MDR product. IA recipients were transplanted and then received ATG conditioning (7.5mg/kg total) and total lymphoid irradiation (TLI)

over 10 days, and IS followed by an infusion of MDR-101 on D11. After 180 days of mixed chimerism, IA recipients initiated a 6-month taper of CNI, and were withdrawn from all IS on D365. CA recipients received continuous IS per institutional SOC.
Results: To date, 30 D/R pairs have been enrolled: 20 pairs randomized to the IA and 10 pairs to the CA. MDR-101 infusion was completed in 16 IA recipients. All 16 IA recipients developed chimerism; 10 IA recipients reached the D365 milestone and completed withdrawal of all IS. Five of 10 recipients later lost chimerism but remain off IS with good graft function without evidence of rejection. There have been no events of GvHD, biopsy-proven acute rejection, dnDSA, opportunistic infection or PTLD. There have been no graft losses or deaths in either group. The median eGFR and SCr at D365 in the IA group were 68.22 mL/min and 1.27 mg/dL, and in the CA group were 61.51 mL/min and SCr 1.31 mg/dL, respectively.
Conclusions: Of the 16 recipients in the IA, 10 recipients have reached D365 and were successfully withdrawn from IS without subsequent episodes or evidence of rejection. This is the first-ever multicenter study to induce operational tolerance in kidney transplant recipients. Study follow-up continues through two-years post IS withdrawal.

Abstract# 224

Kidney Transplant Rejection Can Be Diagnosed or Even Predicted by Tracking Donor Reactive T Cell Clones in Post-transplant Samples

Y. Sambandam[1], M. Kandpal[1], J. He[1], X. Huang[1], T. S. Taylor[1], A. A. Shetty[2], J. M. Mathew[1], J. R. Leventhal[1], *[1]Surgery-Comprehensive Transplant Center, Northwestern University Feinberg School of Medicine, Chicago, IL, [2]Medicine, Nephrology Division, Northwestern University Feinberg School of Medicine, Chicago, IL*

Purpose: To test if kidney transplant (**KTx**) rejection can be diagnosed by monitoring for donor reactive T-cell (**DRTC**) clones in post-transplant (**post-tx**) biopsy and non-invasively in blood and urine samples.
Methods: From a pre-tx anti-donor MLR assay, the CFSE-diluting CD4 and CD8 DRTCs were flow-sorted and the TcR clonal sequences were identified in them by immunoSEQ® Assay (collectively called **TcR-AlloSEQ**). The assumption was that TcR-AlloSEQ would identify recipient's anti-donor T-cell repertoire. Then, in the post-tx period, the presence and abundance of the pre-identified DRTCs were monitored serially in KTx biopsies (3, 12 months and for-cause), blood and urine (3, 6, 12 months and for-cause), again by immunoSEQ.
Results: This is an interim report on the first 30/80 Standard of Care KTx subjects in a single-center non-randomized prospective study - patients were grouped into stable (**n=18**), rejecting (**n=5**) and other causes (n=7) cases. Clones were identified as donor reactive in both CD4 and CD8 subsets from pre-tx MLRs; the DTRCs were mostly from low-frequency clones in the recipient PBMC. DRTCs of both subsets could be detected variably in all post-tx samples. Stable recipients had low DRTCs and rejecting recipients had significantly ($p<0.002$) elevated DRTCs at months 3 and 6, as well as at rejection, in blood, urine and biopsy (Figure 1). DRTCs increase in each rejecting biopsy suggested that it can be used to diagnose acute rejection. Similar DRTCs increases in blood and urine indicated that rejection diagnosis can also be made non-invasively. Increase in DRTCs observed at 3 months post-Tx predicted biopsy-proven acute rejection that occurred after 3 months in 3/5 patients. Dosage changes of TAC, MMF and prednisone along with the IVIg or belatacept treatment resolved the rejection which also resulted the marked decrease in the presence of DRTCs in the 12-month follow-up samples.
Conclusions: These interim results suggested that monitoring for DRTCs can diagnose an ongoing rejection and can even predict an upcoming rejection and that this can be achieved non-invasively in blood or urine. Completion of the whole study is expected to provide more insights.

Abstract# 225

Molecular Epidemiology of Extended-Spectrum Cephalosporin-Resistant Enterobacterales Bloodstream Infections Among Solid Organ Transplant Recipients

J. A. Anesi[1], E. Lautenbach[1], P. D. Tamma[2], K. A. Thom[3], K. Alby[4], E. A. Blumberg[1], W. Bilker[1], J. Omorogbe[1], P. Tolomeo[1], A. Werzen[3], J. Han[5], *[1]University of Pennsylvania, Philadelphia, PA, [2]Johns Hopkins University, Baltimore, MD, [3]University of Maryland, Baltimore, MD, [4]University of North Carolina, Chapel Hill, NC, [5]GlaxoSmithKline, Rockville, MD*

Purpose: Solid organ transplant recipients (SOTR) have been significantly impacted by the emergence of multidrug-resistant bacteria, including extended-spectrum cephalosporin-resistant (ESC-R) Enterobacterales (EB). We determined the molecular epidemiology of ESC-R EB bloodstream infections (BSI) among SOTR.
Methods: A retrospective cohort study was conducted at the Hospital of the University of Pennsylvania, the University of Maryland Medical Center, and The Johns Hopkins Hospital. All SOTR presenting with an ESC-R EB BSI, defined by ceftriaxone minimum inhibitory concentrations ≥1 µg/mL, between 1/1/2010 and 7/1/2018 were included. Real-time polymerase chain reaction was performed to detect beta-lactamase genes among these EB isolates. Multivariable logistic regression was performed to identify risk factors for CTX-M-mediated resistance.
Results: A total of 286 SOTR with ESC-R EB BSI were included, of which 108 (38%) were in the first-year post-transplant, and of which 175 (61%) were kidney, 71 (25%) were liver, 28 (10%) were heart, 23 (8%) were lung, and 9 (3%) were pancreas recipients. Among the ESC-R EB isolates, 144 (50%) were found to harbor a CTX-M gene, 128 (45%) a SHV gene, 45 (16%) a TEM gene, and 5 (2%) a CMY gene (not mutually exclusive). There were 110 (38%) EB isolates that had more than one beta-lactamase gene identified, while 88 (31%) had no beta-lactamase genes detected. On multivariable analysis, CTX-M-mediated resistance was significantly more likely among those SOTR with a history of chronic kidney disease (aOR 3.28, 95% CI 1.20-8.99, P=0.02), but was significantly less likely to be observed among those on chronic sirolimus immunosuppression (aOR 0.35, 95% CI 0.13-0.94, P=0.04) and those with a history of prior EB colonization or infection of the respiratory tract (aOR 0.33, 95% CI 0.14-0.79, P=0.01). There were no significant differences in the beta-lactamase genes observed based on other baseline factors, including organ transplant type, prior antibiotic exposures, or year of BSI.
Conclusions: Fifty percent of ESC-R EB causing BSI among SOTR harbored CTX-M beta-lactamase genes. SOTR with a history of chronic kidney disease were particularly likely to have CTX-M-mediated resistance. Future studies are needed to evaluate the performance of rapid diagnostics aimed at detecting CTX-M genes among SOTR with EB BSI.

Abstract# 226

Cytomegalovirus (CMV) D+/R- Serostatus is Independently Associated with Mortality and Graft Loss After Liver Transplantation (LTx)

P. Vutien, J. Perkins, S. Biggins, J. Reyes, A. Limaye, *Internal Medicine, University of Washington Medical Center, Seattle, WA*

Purpose: It is unknown if donor or recipient (D/R) CMV serostatus, in the era of CMV prophylactic and pre-emptive strategies, remains associated with clinical outcomes in liver transplant (LTx) recipients. We assessed the associations between D/R CMV serostatus on graft loss and mortality in LTx recipients.

Methods: We analyzed all adult U.S. recipients undergoing LTx from 1/1/2010 to 3/14/2020 in the OPTN database. We used univariable and multivariable mixed Cox proportional hazards regression to analyze the associations between D/R CMV serostatus and graft loss or mortality.

Results: Patients were grouped by CMV pairings: D-/R- (n = 7,251), D-/R+ (n = 12,194), D+/R- (n = 11,903), and D+/R+ (n = 22,730). During a mean follow-up of 3.3 ± 2.7 years after LTx, 8,712 (16.1%) of recipients died and 9,703 (17.9%) had graft loss. Recipient survival at 8 years after transplant was 70.1% for D+/R-, 69.8% for D+/R+, 73.5% for D-/R+, and 73.8% for D-/R-. On multivariable regression, compared to D-/R- recipients, D+/R- recipients had significantly higher risks of mortality (adjusted HR 1.13, 95% CI 1.04 - 1.22) and graft loss (adjusted HR 1.11, 95% CI 1.04-1.2). There were no significant associations between CMV D+/R+ and D-/R+ serostatus and mortality or graft loss on multivariable analysis.

Conclusions: Even in the era of CMV prophylactic and pre-emptive strategies, CMV D+/R- serostatus remains independently associated with decreased survival and graft loss in LTx recipients. Studies are needed to define the mechanisms underlying this association.

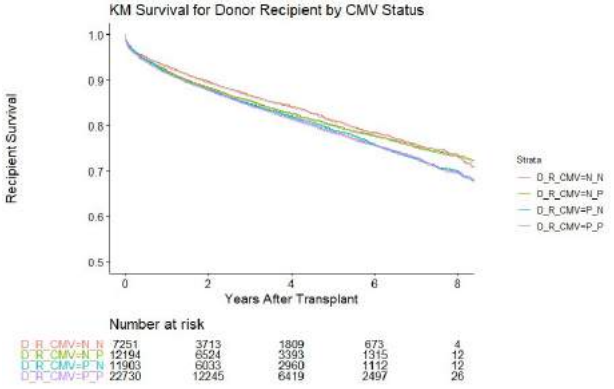

Table. Association between CMV donor and recipient serostatus and mortality

CMV serostatus	Mortality Rate (per 100 P-Y)	Hazard ratio	Adjusted hazard ratio†
D-/R- (n = 7,202)	4.37	1	1
D-/R+ (n = 12,117)	4.62	1.07 (0.99 – 1.15)	1.01 (0.93 – 1.08)
D+/R- (n = 11,819)	5.05	1.15 (1.07 – 1.24)	1.13 (1.04 – 1.22)
D+/R+ (n = 22,578)	5.06	1.17 (1.09 – 1.25)	1.07 (0.99 – 1.15)

Abstract# 227

Cmv Specific Cellmediated Immune Reconstitution During Letermovir Prophylaxis in High Risk Hematopoietic Cell Transplant Recipients

M. Abidi[1], J. Gutman[2], A. Weinberg[2], *[1]University of Colorado Denver/ Anschutz Medical Campus, Aurora, CO, [2]University of Colorado Denver, Denver, CO*

Purpose: Patients who are cytomegalovirus (CMV) seropositive (R+) prior to hematopoietic cell transplant (HCT), have a 30% incidence of clinically significant CMV reactivation in the absence of prophylaxis. At our institution, letermovir prophylaxis through approximately Day 100 is used in CMV R+ high-risk (HR) (cord blood, haplocord, haploidentical) HCT recipients. We hypothesized that clinically nonsignificant CMV reactivation during letermovir prophylaxis may lead to the reconstitution of CMV specific cell-mediated immunity (CMV CMI), which may protect the host against CMV disease after letermovir discontinuation.

Methods: Blood samples from CMV R+ HR HCT recipients on letermovir were tested by dual color CMV specific IL2/IFNg FLUOROSpot pre-transplant and on Days 100, 182 and 360 post-transplant. Clinical and virologic information were obtained from medical records.

Results: Among 41 participants enrolled to date, 26 were eligible for this analysis, which included participants with CMV CMI defined as ≥20 spot-forming cells/10^6 PBMC pre or post HCT and follow up ≥80 days post-HCT. The median age was 55.5 years (range 23-75), 14 were women, 15 were white non-Hispanic, nine were Hispanic, 2 Asian and the most common underlying malignancy was acute myeloid leukemia (n=13). Twenty participants had CMV CMI reconstitution at Day 100; including 6 with and 14 without low-level CMV DNAemia, defined as ≤5000 international units/ml in whole blood quantitative polymerase chain reaction assay, while on letermovir prophylaxis. Among the 20 participants, 14 remained free of clinically significant CMV reactivation for a median (range) of 180 (80;180) days post-letermovir discontinuation, while 6 developed acute graft vs host disease (aGvHD) followed by clinically significant CMV reactivation. 6 participants did not reconstitute CMV CMI at Day 100, one of them had DNAemia while on letermovir. 1 of 6 participants without CMV CMI reconstitution or aGvHD developed CMV disease after letermovir discontinuation. Of the 41 participants, 11 participants had negative CMV CMI <20 spot-forming cells/10^6 PBMC pre-HCT and remained CMV CMI negative at Days 80 and 180 and did not develop CMV infection.

Conclusions: High-risk patient populations can reconstitute CMV CMI while on letermovir. 4.5% of CMV R+ participants had no CMV CMI response pre-HCT, consistently lacked CMV CMI response post-HCT and did not reactivate CMV, indicating that patients may be falsely characterized by CMV antibody assay. CMV CMI assays rather than CMV serologies pre-HCT may be a useful tool to guide risk stratification for CMV monitoring and letermovir usage.

Abstract# 228

Impact of a Cmv Cell Mediated Immunity Based Protocol on Guiding Cmv Prophylaxis Following Pediatric Liver Transplantation - A Single Center Experience

G. Kalkan[1], S. Ball[2], L. McConnell[2], D. M. Desai[3], A. Aqul[3], P. K. Sue[1], *[1]Infectious Disease, University of Texas Southwestern Medical Center, Dallas, TX, [2]Solid Organ Transplant Program, Children's Health, Dallas, TX, [3]Solid Organ Transplant Program, University of Texas Southwestern Medical Center, Dallas, TX*

Purpose: Cytomegalovirus (CMV) is an important cause of morbidity following pediatric orthotopic liver transplantation (OLT), especially among high risk (HR) CMV D+/R- recipients. In 2019, our institution adopted a Cell Mediated Immunity (CMI) based hybrid approach to guide CMV prophylaxis following pediatric OLT. We report our experience using this approach and its implication on the rate of CMV infection, rejection, and valganciclovir (VGC) adverse reactions and cost in our patient population.

Methods: Initial protocol required patients to remain on prophylactic VGC until a CMV IgG is detected (cohort 1). Modified protocol (cohort 2) stratified patients into 3 risk groups; Low (LR) remains on VGC until 6 months post-transplant, intermediate (IR), and high (HR) utilizes CMV CMI to guide VGC prophylaxis duration. Retrospective review of pediatric OLT recipients between January 2017 - December 2018 (cohort 1) and January 2019 - November 2020 (cohort 2). Patients characteristics, CMV infection, CMV disease, rejection, duration of valganciclovir (VGC) prophylaxis, cost of VGC, and drug attributable adverse events were compared between the two cohorts. Fischer's exact test and student T-Test were used to assess differences in categorical and ordinal outcomes between the two cohorts, respectively.

Results: 41 children (21 in cohort 1, 20 in cohort 2), Eight (19.5%) were considered HR (D+/R-), 21 (51.2%) were intermediate (IR) (D+/R+), and 12 (29.2%) were low (D-/R-) risk for CMV infection. All received VGC prophylaxis. Cohort 2 demonstrated no increase in the incidence of CMV infection or disease and decreased episodes of rejection compared to cohort 1. Mean duration of antiviral treatment was decreased by 41%, and associated with a decrease in cost of antivirals by 52%. Adverse events associated with VGC were similar in both groups 19 vs 15%.
Conclusions: Implementation of a CMV CMI based protocol decreased the cost and total days of antiviral prophylaxis following pediatric OLT, and was not associated with increased risk of breakthrough viremia or CMV disease. Incorporating CMV specific CMI may be a useful tool to guide post-transplant CMV prophylaxis and reduce unnecessary antiviral use.

	Pre Protocol (N=21)	Post Protocol (N=20)	p-value
CMV Infection, %	4/21(19.1)	1/20(5)	0.34
CMV Disease, (%)	0/21(0)	0/19(0)	NA
Rejection Events, (%)	11/21(52.4)	4/20(20)	0.05
Total Days Antiviral Therapy, Mean (SD)	403.5(192.2)	266.7(98.5)	<.001
Total Cost of Antiviral Therapy in USD, Mean (SD)	27,501(12,174)	16,779(15,438)	.01
Adverse Events Associated with Antiviral Therapy (%)	4/21(19)	3/20(15)	1

Table: Clinical Outcomes with Implementation of CMV CMI Based Protocol. P-value is based on Fischer's exact test for categorical variables, t test for ordinal variables with normal distribution.

Abstract# 229

Outcomes of Abdominal Transplant Recipients Who Receive Organs from Donors with Positive Cultures

A. Perez Cortes Villalobos, A. Humar, D. Kumar, *University Health Network, Toronto, ON, Canada*

Purpose: Due to limited organ availability, use of donors with positive bacterial cultures is common practice. One of the main concerns is transmission to the transplant recipient, a potentially severe complication, which can be mitigated by peri and post-operative antimicrobials. This study aims to describe outcomes in transplant recipients who received organs from deceased donors with positive bacterial or fungal cultures.
Methods: We conducted a single-center retrospective review of donor cultures in newly transplanted kidney and liver transplant recipients from November 2018 to September 2019. All donors had blood and urine cultures collected prior to procurement. Respiratory cultures (sputum or BAL) were collected if lung donation was considered. CSF was collected if meningitis was suspected. All transplants received 3 doses of cefazolin for perioperative prophylaxis. In addition, one dose of metronidazole was given to liver recipients. All recipients were followed for 90 days post-transplant for bacterial or fungal transmission.
Results: We reviewed 200 transplant recipients from 167 unique transplant donors. The donated organs for transplantation were 154 kidneys, 5 kidney-pancreas, 35 liver and 6 liver-kidney. Of all organ donors, 128 (76.6%) had at least one positive culture with 29/128 (22.7%) bacteremia, 85/115 (73.9%) respiratory, 22/128 (17.2%) urine, and 2/128 (1.6%) CSF. Perioperative antibiotic prophylaxis was modified to cover positive donor cultures in 39/165 (23.6%) of kidney (or combined organ) recipients and 7/35 (20%) of liver recipients. The majority of positive donor urine cultures (17/19) were treated in kidney transplant recipients for a median of 13.8 days (range 7-60) and 25/29 (86.2%) donor bacteremias were treated for a median of 14 days (range 5-43). No transplant recipient had modification of antibiotics to treat positive donor respiratory cultures. During follow up, microbiologically-documented bacterial or fungal infections occurred in 9/200 (4.5%) by day 30 and an additional 5/200 (2.5%) by day 90. No recipient deaths occurred in the first 90 days post-transplant. We identified three episodes (1.5%) of possible donor-derived infections in the first 30 days; two kidney recipients had urine culture positivity in the immediate post-transplant period with the same organism as the donor BAL (*Candida albicans* and *Klebsiella pneumoniae* respectively). The third patient had a positive urine culture with the same organism as isolated in donor urine (*E.coli*). All three infections were treated without complications.
Conclusions: Despite a significant number of positive cultures, no proven donor-derived infections occurred. Therapy for positive donor respiratory cultures is not required in abdominal transplant recipients. Kidneys from donors with bacteremia and bacteriuria can be safely transplanted with appropriate modification of perioperative antibiotics to mitigate the risk of donor derived infection.

Abstract# 230

Evaluating Pneumocystis Jiroveci Pneumonia Prophylaxis in Lung Transplant Recipients

J. Sharkey, K. McMurry, J. Park, C. Carlson, K. Gregg, D. Kaul, D. Lyu, L. Fitzgerald, *Michigan Medicine, Ann Arbor, MI*

Purpose: The incidence of *Pneumocystis jiroveci* pneumonia (PJP) in lung transplant recipients (LTRs) on PJP prophylaxis is not well documented yet reported as high as 28.7%.[1] At this institution, the lifelong prophylaxis regimens for LTRs are overall dosed lower than typical due to concern of toxicity, with sulfamethoxazole/trimethoprim (SMX/TMP) dosed 400/80 mg (SS) three-times weekly (TIW) and dapsone 100 mg TIW. These lower dosing strategies are of particular concern in cystic fibrosis (CF) LTRs as they display altered drug pharmacokinetics, including SMX/TMP. The objective of this study was to evaluate the current PJP prophylaxis protocol for LTRs by assessing the incidence and severity of PJP infection with a focus on LTRs with CF.
Methods: In this single-center, retrospective study, we evaluated 396 patients who received a lung transplant between January 2007 to December 2019. LTRs who died within 30 days of transplant, were multiple organ recipients, or with incomplete data were excluded. The primary outcome was the incidence of PJP infection, defined as warranting treatment. Secondary outcomes included time to PJP infection and severity of PJP infection, defined on outpatient versus inpatient treatment.
Results: 383 LTRs met criteria and 11 positive cases of PJP were identified (2.9%). Four of the 11 cases were on prophylaxis at the time of diagnosis with the remaining 7 cases having stopped prophylaxis before developing PJP. Thus, the overall incidence of PJP in LTRs on prophylaxis was 1.0% and 6.0% in CF LTRs in particular. The average time to infection was 997 days. In the 7 cases who were not on prophylaxis, PJP prophylaxis was held and not restarted in 86% and 14% mistakenly stopped taking prophylaxis. Reasons prophylaxis was held: acute kidney injury (33%), unknown (33%), leukopenia/anemia (34%), hyperkalemia (17%). The average time to PJP infection in these cases was 1325 days, and in 71% a rejection episode and/or a cytomegalovirus (CMV) infection occurred before developing PJP.
Conclusions: The incidence of PJP in LTRs at our institution is lower than reported in the literature, but LTRs with CF represented the majority of PJP cases, suggesting a need for CF specific dosing regimens for prophylaxis. The incidence of PJP in LTRs not on prophylaxis highlights the importance of ensuring lifelong adherence.

Abstract# 231

Epidemiology and Risk Factors for Invasive Fungal Infection in Pancreas Transplant in the Absence of Fungal Prophylaxis

J. Burkey[1], J. M. Chen[2], A. A. Sharfuddin[2], M. S. Yaqub[2], A. J. Lutz[2], J. A. Powelson[2], J. A. Fridell[2], N. Barros[2], *[1]Butler University College of Pharmacy and Health Sciences, Indianapolis, IN, [2]Indiana University Health, Indianapolis, IN*

Purpose: Invasive fungal infections (IFI) remain a rare yet dreaded complication following pancreas transplantation. Current guidelines recommend antifungal prophylaxis in patients with 1 or more risk factors (enteric drainage, vascular thrombosis, and post-perfusion pancreatitis). These recommendations are based

on a single-center study from 1996. In our center, we provide a single dose of antifungal prophylaxis in the OR but none subsequently, regardless of risk factors. Here we evaluate the 1-year cumulative incidence and risk factors associated with the development of invasive fungal infections

Methods: We performed a retrospective, single-center cohort study of adult patients who underwent pancreas transplant alone (PTA) or simultaneous kidney-pancreas transplant (SPKT) at Indiana University from January 1, 2009 through December 31,2018. The electronic health records were manually reviewed, and cases were adjudicated using consensus definitions. Only proven and probable cases were included in the analysis. The 1-year cumulative incidence and mortality and risk factors were analyzed by Kaplan-Meier method and differences between patient populations were assessed with Chi-square

Results: 382 patients were reviewed and analyzed. 215 patients received either a SPKT or pancreas after prior kidney transplant and 167 patients received a PTA. All pancreas allografts are implanted with systemic venous and enteric drainage and patients receive induction with rATG and steroid free maintenance immunosuppression. We identified 14 IFIs. IFI included: Invasive candidiasis (64%), Histoplasmosis (14%) and Aspergillosis (14%). Intrabdominal infections accounted for most IFIs (6/14), bloodstream infections (3/14), disseminated disease (3/14), pulmonary disease (1/14) and invasive fungal sinusitis (1/14). Median time to IFI was 64 days [IQR: 30-234 days]. 1-year cumulative incidence was 3.66%. There were no significant differences between patients with or without IFD regarding type of pancreas transplant (p=0.4), post-transplant renal replacement therapy (p=0.3), rejection (p=0.5), CMV serostatus (p=0.8), or graft-loss (p=0.2). The 1-year mortality in IFI patients was 21% vs 1.4% in non-IFI patients (p<0.0001). Attributable mortality to IFI was 33%

Conclusions: Our study suggests that the avoidance of fungal prophylaxis following pancreas transplantation does not result in high incidence of IFI. Furthermore, there are no specific risk factors that are associated with the development of invasive fungal infections

Abstract# 232

Impact of a Pharmacist-driven Immunization Clinic on Vaccination Rates in Pre-liver Transplant Patients

A. Poparad-Stezar[1], B. Summers[1], M. Fitzmaurice[1], K. Hakamiun[2], N. Sulejmani[3], A. Jantz[1], *[1]Henry Ford Hospital, Detroit, MI, [2]Select Medical, Wyandotte, MI, [3]CareDx, Inc., Sterling Heights, MI*

Purpose: Infectious diseases are a leading cause of morbidity and mortality among patients with end-stage liver disease (ESLD). Vaccination data of ESLD patients pre- and post-transplantation is scarce. This study was created to evaluate the impact of pharmacist intervention on vaccination rates within the ESLD population.

Methods: This study was a retrospective, quasi-experiment evaluating the impact of a pharmacist driven immunization clinic at a large academic medical center established in February 2018. Patients listed for liver transplant between August 2016 and July 2019 were separated into pre- and post-implementation cohorts based on timing of immunization clinic implementation. All patients in the post-implementation group were evaluated by pharmacist for need of hepatitis A, hepatitis B, and pneumococcal conjugate and polysaccharide vaccines according to Advisory Committee on Immunization Practices recommendations; if needed, vaccines were offered at future visits.

Results: A total of 240 patients were included with 120 in each group. Demographics are reported in table 1. Vaccine series initiation rate prior to transplantation was higher in the post-implementation group: 54.9% vs. 15.6%; p<0.001. When evaluating each vaccine series separately, significantly more patients received hepatitis B (41.7 vs. 12.6%, p<0.001) and pneumococcal conjugate vaccination (26.9 vs. 14.4%, p=0.046) in the post-implementation group as compared to the pre-implementation group. The percentage of patients receiving hepatitis A (27.8 vs. 17.1%) and pneumococcal polysaccharide vaccination (30.6 vs. 18.9%) were higher in the post-implementation group, but not statistically significant. Additionally, a higher percentage of patients in the post-implementation group were considered to be up-to-date on their vaccines at end of follow up (31.4 vs. 9%, p<0.001).

Conclusions: The pharmacist-driven immunization clinic significantly increased the incidence of vaccine series initiation in ESLD patients, as well as more patients were considered up-to-date at end of follow up. With appropriate vaccination, these patients are at a decreased risk of vaccine-preventable infections.

Table 1. Baseline Demographics			
Pre-implementation (N=120)	Post-implementation (N=120)	P value	
Mean age, year (range)	58 (25-95)	58 (27-71)	0.612
Male sex, n (%)	72 (60)	72 (60)	1.0
Caucasian, n (%)	79 (66)	78 (65)	0.244
Updated vaccines OR documented immunity, n (%)	79 (66)	12 (10)	0.649

Kidney: Acute Cellular Rejection

Abstract# 233

Belatacept Exposure Not Associated With Rejection. Can Doses be Lowered without Compromising Efficacy?

M. McGowan[1], A. Bickenbach[1], B. Miyagawa[2], A. Christianson[1], T. Mizuno[2], P. West-Thielke[3], J. Leone[4], E. Woodle[1], D. Kaufman[5], A. Wiseman[6], A. Matas[7], A. Vinks[2], R. Alloway[1], *[1]U Cincinnati, Cincinnati, OH, [2]Cincinnati Children's Med Center, Cincinnati, OH, [3]U Illinois, Chicago, IL, [4]Tampa Gen, Tampa, FL, [5]U Wisconsin, Madison, OH, [6]Centura Transplant, Denver, CO, [7]U Minnesota, Minneapolis, MN*

Purpose: Phase 1 and 2 belatacept(BELA) pharmacokinetic(PK) studies informed dosing in phase 3 studies. PK data from these studies revealed higher BELA troughs on Day 5 were associated with lower acute rejection (AR) at 1mo, but no other relationship between PK and AR was observed. AR results were similar in **B**ELA-based **E**arly **S**teroid-withdrawal **T**rial (BEST). BEST samples explored associations between BELA PK and AR under depleting induction.

Methods: Prospectively collected samples were used to retrospectively analyze BELA troughs via a validated quantitative enzyme-linked immunoassay. BELA clearance (Cl) was estimated using Bayesian estimation with published population PK model as the Bayesian prior(Zhou et al) with the clinical software MWPharm+(Mediware). Allometric scaling accounted for weight differences. Individual patient profiles estimated troughs, cumulative area under the curve(AUC) and average concentration(Cavg) during BELA dosing. PK parameters and Cavg at time of AR were analyzed for AR and recurrent AR.

Results: 876 BELA troughs in 191 patients(pts) were modeled. Results showed agreement between observed troughs and both population model-predicted and Bayesian estimated concentrations (R^2=0.84 and 0.88). BELA exposure was no different in rejecting or non rejecting pts(Fig1). No differences in BELA PK parameters were observed based on induction. Inter-individual variability in Cl was low (CV=22%), and closely matched reported Cl. 46(24%) pts had AR and 10(5.2%) pts had recurrent AR. Mean time to AR was 174 (±149) days with 63% of AR prior to 6mo and 26% between 6-12mo. There were no significant differences between allometrically standardized Cl in pts with AR or recurrent AR compared to those without. Cavg and AUC with AR were not significantly different at any time points except for significantly lower Cavg and AUC at 6-12mo in AR. The cumulative Cavg(Fig2) or AUC at time of AR event was influenced by time post transplant.

Conclusions: At labeled BELA doses, Cl, Cavg, and AUC do not appear to correlate with AR. The Cavg observed were significantly higher than threshold and observed concentrations previously reported, especially during the induction phase. Data suggests that higher BELA exposure does not improve AR rates and alternative dosing strategies may be explored.

Abstract# 234

The Effect of the Different Donor-Derived HLA T-Cell Epitope Targets on the Development of T Cell-Mediated Rejection After Kidney Transplantation

A. Senev, E. Van Loon, M. Emonds, M. Naesens, *Microbiology, Immunology and Transplantation, KU Leuven, Leuven, Belgium*

Purpose: Many kidney allografts fail due to rejections caused by the donor and recipient HLA incompatibility. Recent studies have shown that HLA-DR and DQ mismatches are particularly harmful by inducing donor-specific HLA antibodies and causing antibody-mediated rejection. However, due to the absence of HLA-specific biomarkers, it remains unknown which HLA mismatches contribute the most to the development of T-cell mediated rejection (TCMR). In this study, we aimed to investigate the associations of the different donor-HLA-derived T-cell epitope targets, PIRCHE-II scores, and the occurrence of TCMR after kidney transplantation.

Methods: Patients who underwent kidney transplantation between 2004-2013 were included in this study (N=926 with 3515 biopsies, both indication and protocol biopsies). These patients and donors were genotyped at the 2nd field high-resolution HLA level. We used the PIRCHE-II algorithm to calculate the different donor-HLA-derived T-cell epitope scores for all HLA loci.

Results: The median PIRCHE-II score of our cohort was 311.5 (IQR 205-453), and highest in HLA-DQA_1B_1 molecule (76.5; IQR 7-162). 277 patients (29.9%) developed TCMR and 134 (14.5%) developed only borderline changes on at least one allograft biopsy. In a multivariable analysis adjusted for confounders (**Figure 1**), the total PIRCHE-II score was independently associated with an increased risk for developing TCMR (per 10, HR=1.007; 95%CI 1.001-1.013; p=0.03), mainly explained by the PIRCHE-II scores for HLA-DRB_1 (HR=1.071; 95%CI 1.028-1.116; p=0.001) and HLA-DQA_1B_1 molecules (HR=1.013; 95%CI 1.002-1.025; p=0.02). The same associations with PIRCHE-II scores for HLA-DRB_1 and DQA_1B_1 were found when borderline changes are counted as TCMR. In a sensitivity analysis restricted to HLA-DSA negative patients, again, only the T-cell epitope targets originating from the donor's HLA-DRB_1 and HLA-DQA_1B_1 molecules were associated with TCMR. Finally, the same PIRCHE-II scores for HLA-DRB_1 (HR=1.042; 95%CI 1.005-1.081; p=0.02) and HLA-DQA_1B_1 molecules (HR=1.015; 95%CI 1.005-1.026; p=0.0035) were risk factors for all-cause graft failure, independent of HLA-DSA antibodies.

Conclusions: PIRCHE-II scores for HLA-DRB_1 and HLA-DQA_1B_1 are independent predictors for TCMR development and independent risk factors for all-cause graft failure after kidney transplantation, and could be used for improved risk stratification.

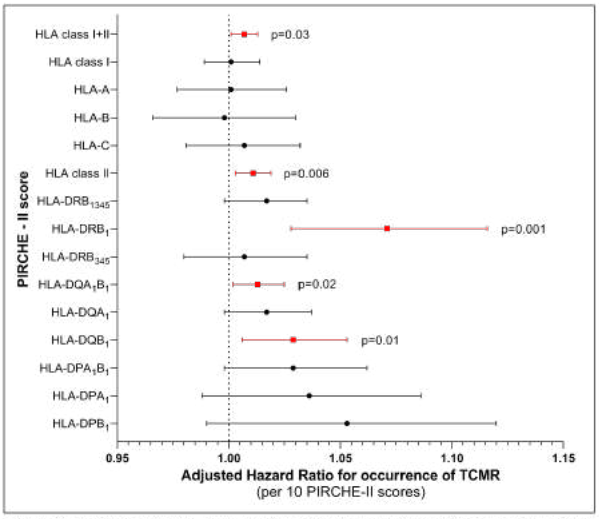

Figure 1. Multivariable Cox hazard ratios for the occurrence of TCMR after kidney transplantation stratified by the different PIRCHE-II scores. Each multivariable Cox model was corrected for donor and recipient age, donor type, cold ischemia time, repeat transplantation, and presence of pretransplant anti-HLA antibodies.

Abstract# 235

Reducing Rejection in Pediatric Kidney Transplantation: The Improving Renal Outcomes Collaborative (iroc)

C. Varnell[1], A. Warmin[1], G. Barletta[2], C. Belsha[3], L. Harshman[4], D. Kershaw[5], C. Pruette[6], S. Ranabothu[7], M. Seifert[8], P. Singer[9], M. Yanik[10], K. Rich[1], A. Modi[1], D. Hooper[1], *[1]Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [2]Phoenix Children's Hospital, University of Arizona, Phoenix, AZ, [3]SSM Health Cardinal Glennon Children's Hospital, St Louis, MO, [4]University of Iowa Stead Family Children's Hospital, Iowa City, IA, [5]C.S. Mott Children's Hospital, Ann Arbor, MI, [6]Johns Hopkins University School of Medicine, Baltimore, MD, [7]Arkansas Children's Hospital, Little Rock, AR, [8]University of Alabama at Birmingham, Children's of Alabama, Birmingham, AL, [9]Cohen Children's Hospital, Brooklyn, NY, [10]Levine Children's Hospital, Charlotte, NC*

Purpose: To study the effect of implementing a Medication Adherence Promotion System (MAPS) on acute rejection (AR) rates in 9 pediatric kidney transplant (KT) programs.

Methods: Time series analysis of AR and biopsy rates across 9 IROC centers who have begun clinical implementation of MAPS: a bundle of evidence-based strategies to identify patients at risk for rejection and address patient/caregiver identified immunosuppression adherence barriers. AR and biopsy rates for all pts > 1-yr post-KT (n=558, 64% male, median age 15y) were analyzed from 1/2018 through 10/2020 using statistical process control u-charts. Centerline and 3 standard deviation control limits were calculated from baseline data and adjusted when special cause was met according to established standards. Charts were annotated with the date each center started bundle interventions.

Results: 130/266 (49%) pts identified at least 1 adherence barrier - most commonly: forgetting to take the medication, hate the taste, and side effects. Baseline rejection rate in the nine centers was 0.94 per 100 patient months, special cause was first noted 8/2019 - the rejection rate decreased to 0.53 rejections per 100 patient months. Baseline biopsy rate in the centers was 6.39 biopsies per 100 patient months, special cause was first noted 8/2019 - the biopsy rate decreased to 3.03 biopsies per 100 patient months. Whereas rejection and biopsy rates both decreased by about 50%,

there was no change in the percentage of biopsies with rejection, suggesting the decrease in rejection rate was not due to ascertainment bias (i.e. simply performing less biopsies).

Conclusions: The spread of a clinical system to identify and address adherence barriers across diverse clinical settings is preliminarily associated with decreased rates of acute rejection and biopsies.

Abstract# 236

Reassessing TCMR in Kidney Transplant Indication Biopsies: Emerging Evidence for Partial Exhaustion in Late TCMR

P. Halloran[1], J. Reeve[1], &. the INTERCOMEX Study Group[2], *[1]Alberta Transplant Applied Genomics Centre, Edmonton, AB, Canada, [2]., ., AB, Canada*

Purpose: We rederived the MMDx rejection archetypes in an expanded set of 1679 kidney transplant biopsies to add power and potentially define heterogeneity in TCMR. We repeated the same analysis in 1716 other biopsies to examine the stability of the classification in an independent set. We were particularly interested in whether T cell exhaustion impacted the TCMR phenotype with increasing time post-transplant.

Methods: We analyzed rejection in microarray results from 1679 kidney transplant indication biopsies using seven machine learning derived rejection classifiers following the same strategies used previously (Am J Transplant. 2019;19:2719).

Results: The scores assigned each biopsy a position in data space when distributed by principal component analysis (PCA) as 4 PCs (**Figure 1A**). Archetype analysis assigned six rejection archetypes (clusters) for both populations, which were very similar: 1: No rejection; 2: early TCMR (ETCMR): 3: late TCMR (LTCMR); 4: early stage ABMR (EABMR); 5: fully-developed ABMR (FABMR); and 6: late-stage ABMR (LABMR).

The principal components of variation in rejection-ness were PC1: no rejection vs. rejection; PC2: ABMR+ vs TCMR -ve; PC3: stages of ABMR (EABMR, FABMR, LABMR); and PC4: stages of TCMR: ETCMR and LTCMR. (PC4 cannot be visualized.) Mixed rejection had varying components of ABMR and TCMR.

The assignment of archetype groups was validated in an independent set of 1716 biopsies, indicating high conservation of the new rejection classification (**Figure 1C,D)**.

The new LTCMR class differed from ETCMR in being later post-transplant (median 506 vs. 258 days), with lower PC1 scores and more histologic and molecular atrophy-fibrosis. Compared to ETCMR, LTCMR had less intense activation signals (e.g. CCL5) and T cell receptor expression. In 24 BK nephropathy with TCMR, 21 were LTCMR. Failures were increased by both ETCMR and LTCMR.

The principal feature that separated ETCMR and LTCMR was principal component 4 (PC4): ETCMR +0.63; LTCMR -0.67. PC4 distinguished a reciprocal relationship between TCMR activity features (e.g. CCL5 correlation -0.387) and a major checkpoint, PD1 (PDCD1): correlation +0.104. All five PD1 probesets anti-correlated with TCMR activity features, suggesting that LTCMR has more T cell exhaustion than ETCMR.

Conclusions: An expanded PCA and archetype analysis recognizes a new class of late TCMR that separates in PC4 from early TCMR and has more fibrosis, less activity, and a reciprocal relationship between checkpoint PD1 and TCMR activity, suggesting a time-dependent increase in T cell exhaustion.

Abstract# 237

Development of Diagnosis Method of Acute Graft Rejection After Kidney Transplantation Using Metabolome Analysis by Liquid Biopsy Approach

H. Iwamoto[1], M. Sugimoto[2], O. Konno[1], I. Akashi[3], M. Okihara[1], Y. Kihara[1], T. Ueno[1], *[1]Kidney Transplantation Surgery, Tokyo Medical University, Hachioji Medical Center, Tokyo, Japan, [2]Research and Development Center for Minimally Invasive and Preemptive Medicine, Institute of Medi, Tokyo Medical University, Tokyo, Japan, [3]Kidney transplantation Surgery, Tokyo Medical University, Hachioji Medical Center, Tokyo, Japan*

Purpose: Presently, a definitive diagnosis of organ dysfunction after transplantation (such as acute rejection) is dependent on conventional histopathological evaluation using an invasive biopsy procedure because blood or imaging studies cannot conclusively diagnose such conditions. Recently, the usefulness of liquid biopsy has been highlighted. This technique involves a minimally invasive approach to collect samples, such as saliva, urine, or blood, which can be evaluated frequently without over-burdening the patient. Metabolomics is one of the omics technologies which enable simultaneous identification and quantifications of hundreds of metabolites. This method has been employed to find these biomarker discoveries using biofluid samples. Here, we utilized metabolomics technologies to discover new biomarkers of acute kidney rejection after transplantation.

Methods: Kidney transplant patients followed up at our hospital were grouped into 3 groups as follows; kidney transplant donors (healthy subjects, n=9), subjects with normal kidney function after kidney transplantation (n=19), and subjects with

impaired kidney function after kidney transplantation (n=32). Pathological diagnosis of this group included T cell-mediated acute rejection (AR) (n=10), antibody-mediated rejection (n=8), calcineurin inhibitor nephropathy (n=3), and the other causes of graft function (n=8). Metabolome analysis was performed on 60 blood, urine and saliva specimens from the subjects. The results of the metabolome analysis were compared with the definitive diagnoses made by using kidney graft biopsy.

Results: In the group of subjects with impaired kidney function after kidney transplantation, 8 substances in blood (asymmetrical dimethylarginine [ADMA], diethanolamine, glycerophosphorylcholine, isocitrate, phenylalanine, symmetrical dimethylarginine [SDMA], serotonin, and valine) and 3 substances in urine (3-indoxy sulfate, ADMA, and *N*-acetylhistidine) and 7 substances in saliva (2-hydroxyglutarate, adipate, ethanolamine phosphate, fumalate, glycolate, proline, sedoheptulose 7-phosphate) that were significantly different ($p<0.001$) from those in the control group, the normal kidney function after kidney transplantation, and the group of kidney transplant donors.

Conclusions: The Salivary test has significant advantages compared to the blood-based test, which can be performed frequently due to its non-invasiveness. Such AR diagnosis methods would be useful as a clinical application.

Abstract# 238

Inflammation in Scarred Cortex (i-IFTA) is Significantly Associated with T Cell-mediated Rejection (TCMR), but Not Antibody-mediated Rejection (ABMR), in Renal Allograft Biopsies (Bx)

H. Zhang, *Transplant Immunology Laboratory, Cedars-Sinai Medical Center, Los Angeles, CA*

Purpose: I-IFTA in renal allograft Bx has been found to be associated with decreased death-censored graft survival. Moderate to severe i-IFTA (2 or 3) is required for chronic active TCMR diagnosis by current Banff classification, although multiple recent studies have suggested that i-IFTA has no specificity to either TCMR or ABMR. Here we conducted an analysis on i-IFTA's association with TCMR or ABMR activity in Bx from patients in our center.

Methods: After excluding Bx with non-rejection causes of inflammation (glomerulonephritis, bacterial or viral infection), 361 Bx from 202 grafts were included and had Banff scores determined. Among them, 131 Bx from 131 unique grafts had definitive rejection diagnoses (52 ABMR, 21 ABMR+TCMR, 23 TCMR) or no rejection (n=35), and their i-IFTA scores were compared. Additionally, 101 pairs of consecutive Bx from 93 grafts were evaluated for possible changes of i-IFTA. Of these, 38 pairs of Bx from 38 grafts showed i-IFTA increasing from 0-1 to 2-3 (Bx intervals all <36 months [12.4±8.9]) and were analyzed for rejection diagnoses. 17 Bx pairs had only ABMR in both Bx (interval: 12.6±8.3 months) and 14 Bx pairs had only TCMR in both Bx (interval: 7.8±6.4 months), each pair from a different graft.

Results: Among 131 Bx with definitive rejection diagnosis, i-IFTA score was significantly higher in both TCMR and ABMR+TCMR groups vs. ABMR and no rejection groups with no significant difference between the latter 2 groups (Table 1). In the 38 pairs of Bx with increased i-IFTA, significant increase of TCMR activity ($p=0.02$) in the 2nd Bx was found by paired comparison, while ABMR activity did not change. 14 pairs of ABMR-free TCMR Bx showed high i-IFTA score in the 1st Bx of each pair, and the high score tended to further increase in the 2nd Bx (from 1.9±1.4 to 2.5±0.9, $p=0.16$), while 17 pairs of TCMR-free ABMR Bx showed minimal i-IFTA in both the 1st and 2nd Bx with no change (from 0.2±0.8 to 0.4±1.0, $p=0.47$).

Table 1. i-IFTA in 131 Bx with definitive rejection diagnosis

	ABMR	ABMR+TCMR	TCMR	No Rejection
i-IFTA	0.8±1.2	1.7±1.4	2.0±1.4	0.7±1.2
p (vs. ABMR)		0.02	<0.01	0.70
p (vs. ABMR+TCMR)			0.56	0.02
p (vs. TCMR)				<0.01

Conclusions: Significant i-IFTA in Bx appeared to be primarily associated with TCMR, but not ABMR activity, in our patients. The i-IFTA increase in consecutive Bx from the same patients with TCMR, but not ABMR activity, further supports this finding. More study is required to determine if this finding is specific to our patient cohort or more widely applicable.

CITATION INFORMATION: Zhang H. Inflammation in Scarred Cortex (i-IFTA) is Significantly Associated with T Cell-mediated Rejection (TCMR), but Not Antibody-mediated Rejection (ABMR), in Renal Allograft Biopsies (Bx) *AJT, Volume 21 Supplement 3*

Abstract# 239

Late Subclinical Rejection and Borderline Rejection in Kidney Transplant Patients is Associated with Increased Incidence of Subsequent Clinical Rejections

V. Viswanathan[1], I. Melgarejo[2], C. Puttarajappa[2], P. Sood[2], M. Molinari[2], S. Hariharan[2], C. Wu[2], A. Sharma[2], N. Shah[2], R. Mehta[2], *[1]Department of Medicine, Renal-Electrolyte Division, University of Pittsburgh Medical Center, Pittsburgh, PA, [2]Department of Surgery, Thomas E. Starzl Transplantation Institute, University of Pittsburgh Medical Center, Pittsburgh, PA*

Purpose: The outcomes of inflammatory changes noted in late surveillance biopsies (1 year) is unclear.

Methods: Patients transplanted (live donor and deceased donor) at our center between Jan 2013 through Dec 2017 were considered for this study if they underwent a late biopsy (at 1 year). Out of 1000 patients, a total of 410 patients were eligible and were divided into 1. NI (n=184; t=0 and i=0); 2. BLR (n=127; t>0 and i>0 but not meeting criteria for Banff IA rejection); and 3. SC-TCMR (n=99; i2t2 or higher on surveillance biopsy). The NI group was used as a negative comparator. TCMR and AMR was treated per institution protocol. We followed all groups for subsequent clinical rejections for a maximum duration of 7 years and median of 4 years. Induction regimen included thymoglobulin (>95% of pts). Maintenance regimen comprised of tacrolimus and mycophenolate mofetil.

Results: There were no significant differences in age, sex, race, HLA mismatch, PRA or other demographics between the groups. Odds Ratio for subsequent clinical rejection was 4.1 (95% CI 1.7-10.7; $p<0.001$) for the BLR group; 5.6 (95% CI 2.3-14.4; $p<0.001$) for the SC-TCMR group.

Conclusions: 1. The odds of having subsequent clinical rejection was 4 times higher in patients with borderline rejection and more than 5 times higher in patients with subclinical rejection noted on late surveillance biopsies. 2. It is important to identify these cohorts of patients with inflammatory lesions noted on late surveillance biopsies in order to closely monitor and treat subsequent rejections while optimizing immunosuppression.

Table 1

Group	Number(n)	Number of pts with subsequent rejection over 7y f/u	Proportion of patients with subsequent rejections	P value (compared to NI)
NI	184	7	3.8%	
BLR	127	20	15.7%	<0.001
SC-TCMR	99	21	21.2%	<0.001
Total	410	48

Abstract# 240

Therapeutic Response of Late Clinical Cell Mediated Rejection is Modeled by Chronicity Changes

I. Melgarejo[1], V. Visnawathan[2], A. Sharma[1], P. Sood[1], C. Puttarajappa[1], C. Wu[1], N. Shah[1], M. Molinari[1], S. Hariharan[1], R. Mehta[1], *[1]Starzl Transplant Institute, University of Pittsburgh Medical Center, Pittsburgh, PA, [2]Department of Medicine, Renal-Electrolyte Division, University of Pittsburgh Medical Center, Pittsburgh, PA*

Purpose: Although there is a tendency to treat late clinical TCMR, the responsiveness to steroids is unclear.

Methods: Among kidney transplant recipients, transplanted between Jan 2013 and December 2017, we followed clinical rejections (beyond 6months) in a cohort of patients who had undergone a 3 month surveillance biopsy and no episodes of clinical rejection. Of the 62 patients who had a late rejection, 45 had pure TCMR (Banff IA/IB in severity). The majority of the patients (>95%) were induced with thymoglobulin at the time of transplant. Those who were diagnosed to have TCMR were treated with steroids 250 mg iv for a total of 3 doses. We compared baseline GFR, GFR at time of biopsy and the best GFR within 3 months of rejection treatment in the TCMR group. Based on the GFR response, the patients were divided into those that continued to have worsening GFR post treatment (n=12) and those where GFR stabilized or improved post treatment (n=33). Based on the binary variable of response to treatment, a multivariable logistic regression was performed taking into consideration recipient age, sex, race, sensitization, DGF and DSA. We used the total i score to account for inflammation in the scarred areas.

Results: The median change in GFR among all clinical TCMR was 4 ml/min (IQR -0.5 to 7.8). Multivariable analysis revealed IFTA score>2 (p=0.017; OR 7.6, CI 1.4-40) was associated with lack of improvement post treatment.
Conclusions: 1. Therapeutic response of pure late T cell mediated rejection to steroids is modest at best, with a median change in GFR of only 4 ml/min. 2. IFTA score of greater than 2 was associated with a poor therapeutic response in pure TCMR. 3. Factors impacting response to late TCMR should be analyzed in larger studies given poor responsiveness to treatment.

Liver

Liver Recipient Selection

Abstract# 241

Pre-Transplant Frailty is Associated with 30-Day Mortality but Not Long-Term Survival After Liver Transplantation

M. Anderson, V. Valbuena, M. Englesbe, C. Sonnenday, *Department of Surgery, University of Michigan Health System, Ann Arbor, MI*

Purpose: Frailty predicts waitlist death in liver transplant (LT) candidates, but the impact of frailty on mortality after LT is unknown. We investigated the association between pre-transplant frailty and survival after LT.
Methods: We analyzed post-transplant outcomes in 224 LT recipients enrolled in a prospective study of frailty in LT candidates at our institution from 07/2009-01/2016. Patients with a frailty assessment in the year prior to LT were included. Patients with assessments more than one year from LT (n=47) or incomplete data (n=1) were excluded. Frailty was assessed by the 5-item Fried frailty instrument measuring gait speed, grip strength, unintentional weight loss, self-reported exhaustion, and physical activity. Demographic and clinical data at the time of frailty assessment and post-LT outcomes were collected. Frailty was defined as a Fried frailty score ≥ 3. The primary outcome was post-transplant survival, analyzed by Kaplan-Meier and Cox proportional hazards models. Inspection of Kaplan-Meier curves showed significantly higher mortality in the first 30 days. To account for non-proportional hazards, survival was examined in two time intervals: ≤30 days and >30 days after LT.
Results: 176 patients met inclusion criteria, of which 49% (n=86) were frail. Frail patients had higher baseline MELD, greater frequency of ascites, and lower frequency of cancer. There was no difference in demographics or other comorbidities by frailty (Table 1). Overall post-transplant survival was 69.9% with median follow up time of 5.8 years. Frailty was associated with a significantly higher risk of death in the first 30 days after LT (HR=27.3, p=0.03). There was no significant difference in 1-year, 3-year, 5-year, or 10-year adjusted post-transplant survival between frail and non-frail patients. Unadjusted Kaplan-Meier curves stratified by frailty and adjusted Cox proportional hazard ratios are shown in Figure 1.
Conclusions: Frailty was associated with early mortality, but not associated with decreased long term survival after LT. Given the well-established association between frailty and waitlist mortality, frail patients may benefit from expedited allocation and prehabilitation.

Selected Baseline Characteristics Stratified by Frailty			
	Non-Frail (n=90)	Frail (n=86)	P
Age (median(IQR))	54.9(45.9-61.4)	57.7(50.7-61.1)	0.090
Female %(n)	24.4(22)	27.9(24)	0.549

Abstract# 242

Relationship of Functional Frailty and Radiographic Sarcopenia to Outcomes After Liver Transplant

S. L. Olson, P. Polineni, W. Schwartz, O. Siddiqui, L. Zhao, D. Ganger, D. P. Ladner, *Comprehensive Transplant Center, Northwestern University, Chicago, IL*

Purpose: Frailty and sarcopenia are associated with increased risk of hospitalization and mortality in end stage liver disease patients. Frailty can be measured clinically using functional scales such as the Liver Frailty Index (LFI), whereas sarcopenia is measured by quantifying muscle mass on imaging. The purpose of this study is to examine the correlation between LFI and sarcopenia, and their relative efficacy in predicting clinical outcomes after liver transplant.
Methods: Patients who underwent LFI testing, abdominal imaging, and liver transplant between 2018-2019 were included in this study. Grip strength, timed chair stands, balance testing, and sex were factored into LFI scores that were rated as frail, pre-frail, and robust. Sarcopenia was assessed by total psoas area at the L3 cross-section on CT or MR and divided by patient height squared. Sex-specific thresholds were used to categorize patients as sarcopenic or non-sarcopenic.
Results: 81 patients were included in this preliminary analysis: 60% male, 77% white, median age at transplant 62, median days on waitlist 48. 69 (85%) of these patients had imaging done near LFI evaluation and were assessed for sarcopenia. 32% of patients were sarcopenic; LFI scores were not significantly different based on sarcopenia status (Fig 1). Frail patients had significantly higher MELD-Na scores than robust patients (21.82 vs. 14.80, p=.05); sarcopenic patients had significantly

higher MELD-Na scores than non-sarcopenic patients (23.46 vs. 17.43, p<.001). Length of post-transplant hospital stay and number of readmissions within 1 year were not significantly different between frailty nor sarcopenia categories. Pre-frail and frail patients had lower survival 1 year post transplant compared to robust patients, whereas sarcopenia was not associated with reduced 1 year survival (Fig 2).
Conclusions: LFI quantified frailty and psoas-derived sarcopenia are both associated with higher MELD-Na scores. LFI is a better predictor of mortality after transplant than sarcopenia. LFI and sarcopenia are poorly correlated, requiring further analysis to determine which risk screening tools should guide pre-transplant frailty interventions.

Abstract# 243

Comorbidity Burden is Associated with Increased Waitlist Mortality Among NASH Patients

J. R. Montgomery[1], M. J. Englesbe[1], C. Connelly[2], *[1]Michigan Medicine, Ann Arbor, MI, [2]General Surgery, Oregon Health & Science University, Portland, OR*

Purpose: Nonalcoholic steatotic hepatitis (NASH) is an increasing and common indication for liver transplantation. The association between increased comorbidity burden and risk of death on the waitlist remains unknown.
Methods: Adult patients listed for liver transplant from 2004-2018 were identified from the UNOS-STAR file. NASH patients were identified by primary diagnosis code and compared with non-NASH patients. Patients who received exception points were excluded. Kaplan Meier estimates of waitlist survival and transplantation within 1 year of listing adjusting for listing MELD-Na score were compared among NASH and non-NASH patients. Subhazard ratios (SHR) were reported separately for days 0-60 and days 61-365 due to nonproportional hazards between cohorts over time. Iterative adjustment was performed for listing MELD-Na score, then patient characteristics and comorbidities (age, sex, BMI, diabetes, and kidney disease).
Results: 61,859 patients were included, of which 12,689 (20.5%) had NASH. NASH patients were more likely to be older, female sex, with a higher burden of comorbidities, but lower MELD-Na scores at listing (Table). NASH patients had lower unadjusted risk of death within 60-days of listing (SHR 0.93, 95%CI 0.89-0.97) but higher risk of death between days 61-365 (SHR 1.12, 95%CI 1.08-1.17). Lower listing MELD-Na score among NASH patients explained the decreased risk of death between days 0-60 (aSHR 1.08, 95%CI 0.99-1.17) but not days 61-365 (aSHR 1.13, 95%CI 1.09-1.18). This is shown graphically in Figure. Further adjustment for patient characteristics and comorbidities resulted in similar risk of death between days 0-60 (aSHR 0.92, 95%CI 0.84-1.02) and lower risk between days 61-365 (aSHR 0.92, 95%CI 0.88-0.96).
Conclusions: NASH patients are listed at lower MELD-Na scores than non-NASH patients. Despite lower listing MELD-Na, NASH patients demonstrated a higher risk of waitlist mortality from days 61-365, associated with higher comorbid disease burden. These data suggest that NASH patients have shorter window to transplantation. Careful assessment and management of comorbidities are particularly important in NASH patients.

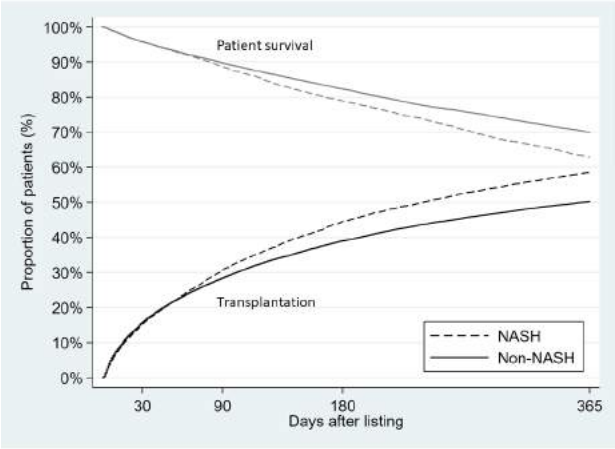

Table (all comparisons P<.001)			
		NASH	Non-NASH
Age	median (IQR)	60 (54, 65)	55 (48, 61)
Female sex	%	50.4	37.1
BMI	median (IQR)	32 (29, 37)	27 (24, 31)
Listing MELD-Na score	median (IQR)	20 (15, 27)	21 (15, 29)
Diabetes	%	55.0	20.3
Dialysis	At listing	8.3%	8.6%
	At list removal	20.1%	18.8%

Abstract# 244

Coronary Computed Tomography Angiography for Pre-Liver Transplant Cardiovascular Risk Assessment: A Single Center Experience

J. Rice[1], T. Genders[2], D. Groves[2], J. R. Burton[1], J. Moloo[2], R. Quaife[2], D. Vargas[3], M. Kriss[1], *[1]Division of Gastroenterology and Hepatology, University of Colorado, Aurora, CO, [2]Division of Cardiology, University of Colorado, Aurora, CO, [3]Division of Radiology, University of Colorado, Aurora, CO*

Purpose: Coronary computed tomography angiography (CCTA) is an established non-invasive imaging modality for diagnosing coronary artery disease (CAD), though its use for cardiovascular disease (CVD) risk assessment prior to liver transplant (LT) remains limited. Our center has incorporated routine CCTA into our pre-LT CVD risk assessment protocol and the purpose of this study is to examine the efficacy and safety of the protocol.
Methods: We retrospectively reviewed all patients undergoing LT evaluation at our center from 7/1/18 to 6/30/20. Patients evaluated for acute liver failure or re-transplant were excluded. Coronary artery calcium (CAC) scores, CAD reporting and data system (CAD-RADS) scores, medication administration, and adverse outcomes were collected on all patients. Patients with pre-existing CAD underwent invasive coronary angiography (ICA). Patients age >50 or age 40-50 with longstanding diabetes or >10 pack-year smoking history underwent CCTA if GFR >40 cc/min. Patients with contraindications to CCTA underwent stress echocardiogram or ICA based on CVD risk factors. CAD was defined as the presence of any atherosclerotic coronary disease. All patients with obstructive CAD, defined as any vessel >70% stenosis (or left main >50%) or lesions with positive (< 0.8) fractional flow reserve computed tomography (FFR-CT), underwent ICA.
Results: A total of 605 patients were evaluated for LT with 278 completing CCTA, however 8 completed only CAC score due to high calcium burden. CCTA results are shown in Table 1. CAD was diagnosed in 63.8% of patients, of whom 8.5% had obstructive CAD. Median CAC scores were higher for obstructive CAD versus

nonobstructive (537 [IQR 123-1300] vs 74 [IQR 13-263], p=0.019). FFR-CT was performed in 32 patients with 46.9% having a flow limiting lesion. Metoprolol was administered in 69.2% of patients to achieve adequate heart rate (<70 bpm) and nitroglycerine in 69.2% to achieve coronary hyperemia. Only 2 patient required escalation of care for hypotension. A total of 42 patients (15.2%) required ICA after CCTA.

Conclusions: CCTA is a promising non-invasive imaging modality for detecting CAD during pre-liver transplant CVD risk assessment with a high technical success rate and low complication rates.

Table 1: CCTA Results

CAD-RADS Score	N (%)
0 (No plaque or stenosis)	56 (20.7%)
1 (1-24% stenosis)	80 (29.6%)
2 (25-49% stenosis)	58 (21.5%)
3 (50-69% stenosis)	23 (8.5%)
4 (70-99% stenosis or >50% left main stenosis)	14 (5.2%)
5 (100% occlusion)	1 (0.4%)
N (Non-diagnostic)	38 (14.1%)

Abstract# 245

Recipient Selector for Donation After Cardiac Death Allografts

G. Handing[1], S. Ganni[2], S. Barrett[1], N. Galvan[2], C. O'Mahony[2], J. Goss[2], R. Cotton[2], A. Rana[2], *[1]School of Medicine, Baylor College of Medicine, Houston, TX, [2]Michael E DeBakey Department of Surgery, Division of Abdominal Transplant, Houston, TX*

Purpose: Donation after cardiac death (DCD) allografts might represent one of the largest untapped sources of liver allografts. Our aim was to identify independent donor and recipient risk factors that predict mortality in DCD allograft recipients to select optimal candidates for successful transplants.

Methods: Using the Organ Procurement and Transplantation Network database, we performed a univariate and multivariate retrospective analysis on 4,228 DCD liver allograft recipients.

Results: We identified 11 significant factors and incorporated them into the weighted recipient selector index (RSI) to successfully predict 3-month survival following DCD liver transplantation with a C-statistic of 0.7040. MELD score components were included as individual predictors; thus, the novel DCD RSI (DCD Recipient Selector Index) can predict survival independently of MELD. The most significant recipient risk factors were recipient serum sodium levels greater than 150 mEq/L at transplant, donor age of 60-70 years, recipient albumin less than 2.0 g/dL at transplant and recipient INR of 3-3.5 at transplant. Donor risk index was not found to be a significant predictor.

Conclusions: The DCD RSI can help quantify survival benefit for recipients and increase utilization of DCD donor allografts by matching the allograft to the recipient with the highest chance of success.

Abstract# 246

Cardiac Risk Assessment in Liver Transplant Candidates: Survey of National Practice Patterns

P. Barman[1], R. Chadha[2], L. VanWagner[3], *[1]Div. of GI/Hepatology, University of California, San Diego, San Diego, CA, [2]Anesthesiology, Mayo Clinic, Jacksonville, FL, [3]Div. of GI/Hepatology, Northwestern University, Chicago, IL*

Purpose: Cardiac disease is a leading cause of morbidity and mortality in the first year after liver transplantation (LT) and pre-transplant identification is vital to post-transplant outcomes. However, clear evidence-based practice guidance for cardiac risk assessment in LT candidates is lacking. We sought to characterize current practice patterns across transplant centers.

Methods: We surveyed 117 LT programs across the United States using Research Electronic Database Capture (REDCap). The survey addressed personnel involved, protocols utilized, and specific modalities used in risk assessment and diagnosis of coronary artery disease (CAD) and cardiac function.

Results: Of 61 responses, the majority (72%) of programs had a written protocol for risk assessment. 36 programs utilized a dedicated cardiologist for risk stratification, and 50% were involved in selection meeting. Most (70%) programs involved an anesthesiologist in risk stratification; 73% of these were involved in selection meeting. For assessment of cardiac risk, 92% of programs utilized a risk-based approach. The most commonly used risk factors were prior MI/stroke (89%), revascularization (89%), diabetes (87%), age (84%), and smoking (80%); only 56% used NASH as a risk factor. The age threshold to trigger additional testing ranged from 30-70 years old with caveats based on specific risk factors. For non-invasive testing in CAD, most programs used EKG (84%) and dobutamine stress echocardiography (80%). Less than half (49%) used single-photon emission computed tomography and only 30% routinely used coronary computed tomography angiography. Over half (52%) deferred invasive coronary angiography as the last test prior to listing, however only 8 (13%) programs had a specific protocol for management of identified CAD. For cardiac function, nearly all programs (93%) obtained an echocardiogram, though only 8 (13%) programs routinely utilized myocardial deformation imaging; 56% specifically used DSE for this indication. Finally, most programs repeated assessment for both CAD and cardiac function (85% and 89%, respectively) though time interval varied from < 6 months to > 2 years.

Conclusions: Practice patterns for cardiac risk assessment in LT candidates are heterogeneous across the country and do not reflect current evidence-based recommendations (Figure). This represents an area ripe for standardization to improve identification of cardiac disease and optimize risk for cardiac events after transplant.

Abstract# 247

Outcomes After Liver Transplantation With Steatotic Grafts: Redefining Acceptable Cutoffs for Moderately Steatotic Grafts

B. L. Da[1], J. Satiya[2], R. P. Heda[3], Y. Jiang[4], L. Lau[5], A. Fahmy[1], A. Winnick[1], N. Roth[1], E. Grodstein[1], P. J. Thuluvath[6], A. K. Singal[7], T. D. Schiano[8], L. W. Teperman[1], S. K. Satapathy[1], *[1]Liver Disease, Northwell Health, Manhasset, NY, [2]Beth Israel Deaconess Medical Center, Boston, MA, [3]Tulane Medical Center, Memphis, TN, [4]The University of Memphis, Memphis, TN, [5]Northwell Health, Manhasset, NY, [6]University of Maryland School of Medicine, Baltimore, MD, [7]Liver Disease, Avera McKenna University Health Center and Transplant Institute, Manhasset, NY, [8]Icahn School of Medicine at Mount Sinai, New York City, NY*

Purpose: Graft macro-steatosis can predispose to worse graft survival. Our objective was to redefine acceptable cutoffs for graft steatosis using the national database.

Methods: Data of 26,103 donors who underwent LT between January 2004 to December 2018 from the United Network for Organ Sharing-Standard Transplant Analysis and Research (UNOS-STAR) database were utilized. A high-risk steatotic (HRS) and low-risk steatotic (LRS) graft was defined as ≥20% and <20% macro-steatosis, respectively. HRS grafts was further classified as grafts with 20-29% (G1S grafts), 30-39% (G2S grafts), and ≥40% steatosis (G3S grafts). Outcomes between groups were compared using Kaplan-Meier curves and multivariate Cox proportional regression analysis.

Results: Recipients of LRS grafts had a graft (93.3% and 87.7%) and overall survival (95.4% and 90.5%) at 90 days and 1-year. Compared to LRS grafts, G1S, G2S, and G3S grafts had worse graft and overall survival at 90 days and 1-year (P < 0.001). However, there was no difference in graft or overall survival at 90 days or 1-year when G2S grafts were compared to G1S or G3S grafts. After adjusting for significant predictors of graft loss, higher steatosis grades were associated with an increased risk of graft loss. Relative to LRS grafts, G3S grafts had the highest risk of graft loss - aHR 1.38 [1.16-1.63], P < 0.001.

Conclusions: Although HRS grafts are associated with worse post-LT outcomes compared to LRS grafts, excellent outcomes are seen in the United States due to proper recipient to donor matching. Increasing steatosis grades among HRS grafts is associated with worse graft survival after accounting for other significant predictors of graft loss.

Abstract# 248

The Utility of PET/ CT Testing in Cardiac Risk Stratification of Adult Liver Transplant Candidates

M. A. Tincopa[1], R. Weinberg[1], S. Sengupta[1], J. Slivnick[2], J. Corbett[1], C. Sonnenday[1], R. Fontana[1], P. Sharma[1], *[1]Internal Medicine, University of Michigan, Ann Arbor, MI, [2]Internal Medicine, Ohio State University, Columbus, OH*

Purpose: Optimal cardiovascular (CV) risk stratification in liver transplant (LT) candidates remains unclear. The aim of this study was to assess concordance and utility of findings between dobutamine stress echo (DSE), positron emission tomography/computed tomography myocardial perfusion imaging (PET/CT MPI) and left heart catheterization (LHC) in LT candidates. Secondary aims were to evaluate CV testing results in relationship to 6-month post LT CV outcomes.

Methods: Data on 234 consecutive adult LT candidates evaluated between February 2015 thru June 2018 with PET/CT MPI was reviewed. CV outcomes were adjudicated by a board certified cardiologist.

Results: Median age was 60.8, 61% were male, 87% white, 54% had diabetes, median MELD-Na 14, and body mass index (BMI) 30.2 kg/m^2. 37% had NASH and 29% alcoholic liver disease. 65% of patients had a DSE, with 41% non-diagnostic. No factors were independently associated with likelihood of having a non-diagnostic DSE. The median global myocardial flow reserve (MFR) was 1.8 ml/min and correlated positively with hemoglobin and negatively with MELD-Na, age, ejection fraction and BMI. 32 (13%) patients had moderate/high risk MPI results and associations with these findings are shown in **Table 1**. Older age and a history of CV disease were independently associated with moderate/high risk MPI findings. In patients with 2 testing modalities, findings were concordant in 80% (**Table 2**). 53 patients underwent LT and 11 had a CV complication. No factors were independently associated with risk of outcomes.

Conclusions: Cardiac risk stratification was concordant across modalities the majority of the time in LT candidates. PET/CT MPI may be the initial CV risk stratification modality of choice in older patients and those with a history of CV disease.

Late-Breaking: COVID-19

Abstract# LB 1

Safety of Sars-cov-2 Mrna Vaccines in Solid Organ Transplant Recipients

M. Ou, B. Boyarsky, J. Motter, R. Greenberg, A. Teles, J. Ruddy, M. Krach, W. Werbel, R. Avery, A. Massie, D. Segev, J. Garonzik-Wang, *Johns Hopkins School of Medicine, Baltimore, MD*

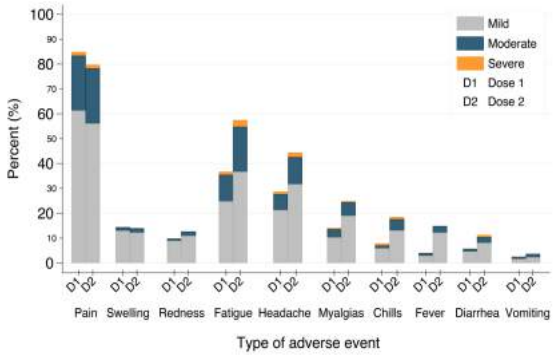
Purpose: The safety of SARS-CoV-2 mRNA vaccines in solid organ transplant recipients (SOTRs) remains unknown. We investigated adverse events in SOTRs who received these mRNA vaccines.

Methods: We studied SOTRs between 12/16/2020 - 2/10/2021 who received at least one dose of a vaccine. Vaccine reactogenicity within one week following the first or second dose was self-reported via an interactive, online platform.

Results: A total of 790 SOTRs received either the Pfizer/BioNTech (49%) or Moderna (51%) vaccine. Most participants have, thus far, received only one dose, but 211 (27%) received both doses. The median (IQR) age was 58 (43-68), with 57% female, 90% White, and 81% college educated. Organs transplanted include kidney (56%), liver (20%), and heart (16%), with a median (IQR) of 6 (3-13) years since transplantation. There were no reports of new COVID-19 infection, acute rejection, anaphylaxis requiring epinephrine, or new neurological conditions such as Guillain-Barré or Bell's palsy. Overall, moderate to severe local and systemic adverse reactions remained low (Figure 1). Comparison between the first and second dose showed that moderate to severe systemic adverse reactions, while uncommon, were higher after the second dose, including fatigue (22% vs 12%, p<0.001), headache (14% vs. 8%, p<0.01), chills (6% vs. 2%, p<0.01), and fever (3% vs. 1%, p<0.001)(Table 1).

Conclusions: In our observational cohort, there were no reports of new COVID-19 infection, acute rejection, anaphylaxis requiring epinephrine, or new neurological conditions following SARS-CoV-2 mRNA vaccination. While uncommon, moderate to severe systemic adverse reactions were higher after the second dose. Thus far, there are no large safety concerns for SARS-CoV-2 mRNA vaccines in SOTRs.

Figure 1. Total adverse events after the first and second dose of a SARS-CoV-2 mRNA vaccine



Note: dose 1, n = 790
dose 2, n = 211

Abstract# LB 2

A Mechanistic Evaluation to Guide the Optimal Immunosuppression Adjustment Strategy in Transplant Patients with COVID-19

V. Hall, V. Ferreira, D. Kumar, A. Humar, *UHN, Toronto, ON, Canada*

Purpose: The optimal management of immunosuppression in transplant patients infected with COVID-19 is unknown. Reduction in calcineurin inhibitors or antimetabolite doses is often performed in order to enhance immune responses, but there are minimal data to guide decisions. We performed an *in vitro* study to determine the effect of individual immunosuppressive agents and doses on SARS-CoV-2 specific T-cell cytokine expression.

Methods: Peripheral blood mononuclear cells (PBMCs) were isolated from nine non-immunosuppressed patients diagnosed with COVID-19 at least 14 days prior. Cells were pre-incubated for four hours with clinically relevant, differing concentrations of immunosuppressive drugs (tacrolimus (TAC), mycophenolate (MPA), sirolimus, prednisone). PBMCs were then stimulated with SARS-CoV-2 spike and nucleoprotein peptide pools for 24 hours with appropriate positive and negative controls. Supernatants collected were analyzed by a 14-plex high sensitivity T-cell cytokine array (Eve Technologies).

Results: PBMCs stimulation with SARS-CoV-2 peptides resulted in broad cytokine responses. In the presence of TAC at medium (6ng/ml) and high concentrations (24ng/ml) (both are commonly achieved trough/peak clinical concentrations respectively), there were significantly reduced levels of IL-2 (p=0.0078 for both), and at high concentrations, lower amounts of IFN-γ (p= 0.0391) in response to peptide stimulation. TAC (24ng/ml) also resulted in a skewing of the response from a TH1 to a TH2 phenotype as indicated by lower IFN-γ: IL-13 ratio (p=0.0273), and IFN-γ: IL-4 ratio (p=0.0234). In contrast, differing clinically relevant concentrations of MPA and prednisone did not appear to influence the cytokine response post-peptide stimulation. Interestingly, Sirolimus at medium (4ng/ml) and high (16ng/ml) concentrations was found to be significantly associated with pro-inflammatory cytokine release in response to SARS-CoV-2 peptides; TNF-α (p=0.0078 for both), IL-6 (p=0.0234 for both) and IL-1β (p=0.0156 and p=0.0078, respectively). When expressed as a pro- vs. anti-inflammatory ratio (with IL-10 as the anti-inflammatory cytokine), this finding remained consistent.

Conclusions: These in-vitro results could help guide clinical decisions. Greater concentrations of TAC led to an inhibition of Th1 responses, whereas sirolimus led to an unexpected proinflammatory response, and MPA was neutral. This suggests that for transplant patients with COVID-19, a reduction of TAC may be of greater benefit than MPA. For those on sirolimus, reduction should be considered if evidence of an inflammatory phase.

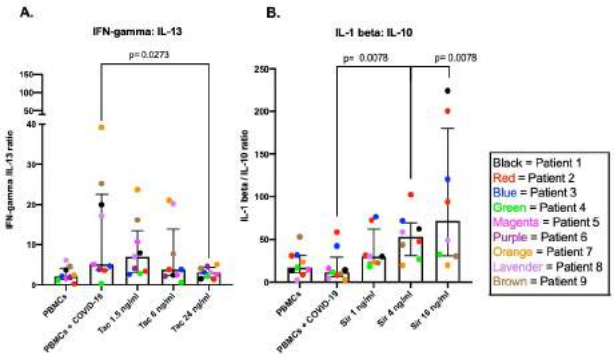

Figure 1 A) Inhibition of Th 1 response at high concentration of tacrolimus (24ng/ml) indicated by reduced IFNγ:IL-13 ratio compared to the negative control **B)** Pro-inflammatory cytokine release with increased IL-1 beta: IL-10 ratio in the presence of medium (4ng/ml) and high concentrations (16ng/ml) of sirolimus compared to the negative control.

Abstract# LB 3

Monoclonal Antibody Therapy for COVID-19 in Solid Organ Transplant Recipients

Z. A. Yetmar[1], E. Beam[1], J. C. O'Horo[1], R. Ganesh[2], D. M. Bierle[2], L. Brumble[3], M. T. Seville[4], R. R. Razonable[1], *[1]Infectious Diseases, Mayo Clinic, Rochester, MN, [2]General Internal Medicine, Mayo Clinic, Rochester, MN, [3]Infectious Diseases, Mayo Clinic, Jacksonville, FL, [4]Infectious Diseases, Mayo Clinic, Scottsdale, AZ*

Purpose: Bamlanivimab and casirivimab-imdevimab are authorized for emergency use treatment of mild-to-moderate COVID-19 in patients at high-risk for progression to severe disease or hospitalization. For various reasons, their use has been limited in the clinical setting. Moreover, their safety or efficacy has not been evaluated in solid organ transplant (SOT) recipients.

Methods: The Mayo Monoclonal Antibody (MAB) Program was established on 11/07/2020. We retrospectively reviewed SOT recipients who received MAB for COVID-19 at Mayo Clinic in AZ, FL, or MN through 01/23/2021. Data included demographics, transplant type, and adverse effects attributed to MAB. Outcomes included emergency department (ED) visit, hospitalization, intensive care unit (ICU) admission, mortality, and allograft rejection at 28 days.

Results: Seventy-three patients were treated. Median age was 59 years, 46 (63%) were male, and median Charlson comorbidity index was 5. Transplants included 41 kidney (56.2%), 13 liver (17.8%), 11 heart (15.1%), 4 kidney-pancreas (5.5%), 2 lung (2.7%), 1 heart-liver, and 1 pancreas recipient. Fifty-six patients had complete 28-day follow-up. Nine patients were hospitalized, including 7 attributed to COVID-19, for median of 4 days. No patient died, required mechanical ventilation, or had allograft rejection. Ten adverse effects were reported, most commonly fever, without any report of anaphylaxis. Median time to MAB from symptom onset was 6 days for hospitalized patients vs. 4 days among non-hospitalized patients (p=.03). Hospitalization was associated with hypertension (p=.02). Outcomes are presented in table 1.

Conclusions: Hospitalizations and ED visits remain common after MAB for COVID-19 in SOT recipients. However, only one patient required ICU admission, and there was no death or rejection. Earlier MAB infusion appears to be more efficacious. Updated data from our expanding MAB Program will be presented at the ATC meeting.

Outcomes at Differing Time-Points from Monoclonal Antibody Administration			
	14 Days (n=69)	21 Days (n=63)	28 Days (n=56)
ED Visit, n (%)	8 (11.6%)	10 (15.9%)	11 (19.6 %)
Hospital Admission, n (%)	7 (10.1%)	8 (12.7%)	9 (16.1%)
ICU Admission, n (%)	1 (1.4%)	1 (1.6%)	1 (1.8%)

Abstract# LB 4

Reduction in Hospitalizations and Deaths in Covid-19 Positive Abdominal Organ Transplant Recipients Following Implementation of A Protocol for Early Treatment with Bamlanivimab

A. Ahearn, T. Maw, J. Emamaullee, J. Kim, E. Blodget, J. Kahn, C. Goldbeck, L. Sher, Y. Genyk, *Abdominal Transplantation, Keck Medical Center of USC, Los Angeles, CA*

Purpose: In December of 2020, our program was identifying up to twenty COVID-19 positive abdominal transplant recipients per week. After seeing our high hospitalization and mortality rate, we implemented a programmatic response, that included Bamlanivimab administration to all eligible patients. The purpose of this abstract is to review the outcomes of COVID-19 infection in our patients, evaluate the efficacy of our program's response, and determine if outpatient monoclonal antibody therapy impacted hospitalization and death rates.

Methods: A database was created to track the outcomes of all liver and kidney transplant recipients who had a confirmed COVID-19 infection via PCR testing. On December 21, 2020, we implemented the following protocol for all symptomatic patients who did not meet hospital admission criteria (WHO Class 2 or 3): 1) Staff and patient education for communications regarding patient's symptom progression; 2) home monitoring using Pulse Oximetry; and 3) outpatient Bamlanivimab administration to all patients who were identified within 10 days of a positive test.

Results: As of February 2021, we have identified 105 liver transplant recipients and 116 kidney transplant recipients who have tested positive for COVID-19. These patients were between 27 days and 18.8 years after transplant (Median 1007 days). The case counts and disease severity before and after the protocol was implemented are shown in Figure 1. Concerningly, hospitalized recipients had a 31% and 46% mortality for liver and kidney respectively. To study outpatient Balanivimab therapy, we excluded all patients who presented as inpatient admissions. 86 liver and 91 kidney patients were initially identified as WHO Class 2 or 3. Of these patients, 15 Liver and 16 Kidney patients were treated with Bamlivamab. When comparing those patients who could have potentially been treated to those who received Bamlivamab, we reduced our rates of hospitalization from 29% to 10% and death from 13% to zero. Chi-squared analysis comparing the association between disease progression and antibody administration was significant (p=.04).

Conclusions: Our findings show the severity of morbidity and mortality of COVID-19 in abdominal transplant patients. Our early experience suggests that outpatient bamlanivimab therapy can reduce disease progression and prevent hospitalization. All eligible patients should be offered this therapy and we will continue to accumulate data in this regard.

Abstract# LB 5

Mortality in Organ Transplant Recipients with Covid-19 Compared to Non-transplant or Waitlisted Patients: A Meta-analysis

A. H. Lerner, E. Klein, D. Farmakiotis, *Rhode Island Hospital/Brown University, Providence, RI*

Purpose: Organ transplant recipients (OTR) are considered at high risk for adverse outcomes from COVID-19. However, mortality rates range from <5% to >30%. Some studies found that OTR have comparable outcomes with non-transplant patients, whereas other investigators reported higher mortality rates. To our knowledge, there are no published meta-analyses comparing outcomes between OTR and non-transplant patients with COVID-19.

Methods: Two independent abstractors conducted a systematic search of PUBMED and EMBASE databases, references of articles retrieved, and major transplantation journals. We included studies published between 12/1/19 and 2/11/21, and performed a study-level random-effects meta-analysis with pooling of all-cause mortality, comparing separately OTR with non-transplant and waitlisted patients.

Results: We included 26 studies with a total of 3,331 OTR. 83% were kidney, 8% liver, 6% heart and 3% lung transplant recipients. 66.3% were men. OTR had higher mortality compared to controls, however the difference did not reach statistical significance, and heterogeneity was high (Fig. 1). When analyzing studies evaluating OTR and controls that were matched for potential confounders, the difference in mortality was statistically significant, with a marked decrease in heterogeneity and risk of publication bias (Fig. 2). OTR did not have significantly higher mortality compared to waitlisted patients, but, again, heterogeneity was high (Fig. 3).

Conclusions: OTR with COVID-19 seem to have higher mortality rates compared to immunocompetent individuals, but not waitlisted patients. OTR should be considered a high priority group for preventive and therapeutic interventions.

Effect of HLA Class II Polymorphism on Predicted Cellular Immunity Against SARS-CoV-2 at the Individual Level and Within Twenty Five Race/ethnic Groups

H. C. Copley[1], L. Gragert[2], A. R. Leach[3], V. Kosmoliaptsis[1], *[1]Department of Surgery, University of Cambridge, Cambridge, United Kingdom, [2]Department of Pathology, Tulane University School of Medicine, New Orleans, LA, [3]European Bioinformatics Institute (EMBL-EBI), Hinxton, United Kingdom*

Purpose: Development of adaptive immunity after COVID-19 and after vaccination against SARS-CoV-2 is predicated on recognition of viral peptides, presented on HLA class II molecules, by CD4+ T-cells. The aim of this study was to investigate the role of HLA polymorphism on SARS-CoV-2 immunogenicity at the population and the individual level.

Methods: We capitalised on extensive high-resolution HLA data from 8.9 million donors in the NMDP/BeTheMatch registry to estimate HLA Class II haplotype frequency distributions for twenty five human race/ethnic populations. This information was used to generate multi-locus HLA class II genotypes for each population group (ten random samples of 10,000 individuals for each population). NetMHCIIpan4.0 was used to assess peptide presentation from the entire SARS-CoV-2 Proteome.

Results: Within populations, we found wide inter-individual variability in predicted CD4+ T-cell reactivity against structural, non-structural and accessory SARS-CoV-2 proteins, according to individual HLA genotype. This was particularly pronounced for Nucleocapsid and specific non-structural proteins, whereas robust reactivity against Spike, the main vaccination target, was predicted despite significant variation in Spike-derived peptide presentation by individual HLA genotypes (Figure 1). Notably, we found similar potential for anti-SARS-CoV-2 cellular immunity at the population level suggesting that HLA polymorphism is unlikely to account for observed disparities in clinical outcomes after COVID-19 among different race/ethnic groups.

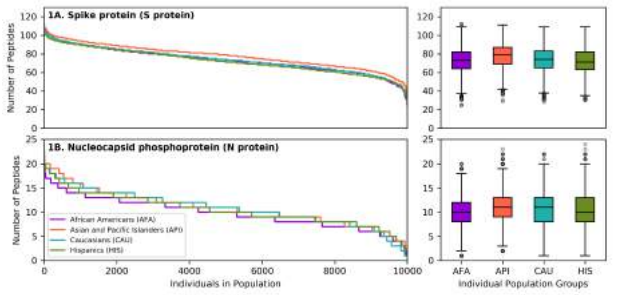

Figure 1. Panels depict the number of SARS-CoV-2 peptides presented by individual HLA class II genotypes in simulated populations of 10,000 individuals for four broad population groups (African Americans, Asian and Pacific Islanders, Caucasians and Hispanics) for 1A. Spike Glycoprotein, 1B. Nucleocapsid phosphoprotein.

Conclusions: Our findings provide important insight on the potential role of HLA polymorphism on development of protective immunity after SARS-CoV-2 infection and after vaccination and a firm basis for further experimental studies in this field.

Abstract# LB 7

Limited Immunogenicity of a Single Dose of Sars-cov-2 Mrna Vaccine in Solid Organ Transplant Recipients

B. Boyarsky, M. Ou, R. Greenberg, A. Teles, W. Werbel, R. Avery, A. Tobian, A. Massie, D. Segev, J. Garonzik Wang, *Johns Hopkins, Baltimore, MD*

Purpose: Given substantial challenges with vaccine allocation and evidence for short-term vaccine efficacy after a single dose of SARS-CoV-2 mRNA vaccines in clinical trials, some have proposed prioritizing first dose administration to reduce COVID-19 morbidity, potentially resulting in delays of second dose administration, or even purposefully withholding second doses for much longer intervals than evaluated in the clinical trials. However, this evidence is largely based off of the early vaccine trials which largely excluded immunocompromised patients. To better understand the immunogenicity of the available SARS-CoV-2 vaccines in immunocompromised individuals, we quantified the humoral response to the first dose of SARS-CoV-2 vaccine in solid organ transplant recipients (SOTRs).

Methods: SOTRs who underwent SARS-CoV-2 vaccination were recruited to participate in this study. Participants underwent at-home blood sampling with the TAPII™ Blood Collection Device (7SBio, Medford, MA) or venipuncture. TapII™ samples were tested on the EUROIMMUN enzyme immunoassay (EIA) which tests for IgG to SARS-CoV-2 spike protein. Venipuncture samples were tested on the Roche Elecsys® EIA which tests for antibodies against the receptor binding domain of the SARS-CoV-2 spike protein. Both tests are semi-quantitative and consistent correlates of neutralizing immunity.

Results: We studied 279 SOTRs between 12/29/20-2/12/21. None had a prior COVID-19. Median (IQR) age was 51 (40-65) years, 64% were female, 87% were white, and 6% Hispanic/Latino. Median (IQR) time since transplant was 6 (3-13) years; maintenance immunosuppression included tacrolimus (96%), steroids (53%), mycophenolate (74%), azathioprine (9%), sirolimus (4%), everolimus (4%). At a median (IQR) of 20 (15-23) days after the first dose, antibody was detectable in only 16% of participants (binomial exact 95% confidence interval 12-21%). Those not on anti-metabolite maintenance immunosuppression were 5.2 times (95% CI 3.1-8.7, p <0.001) more likely to develop an antibody response.

Conclusions: The vast majority of participants did not mount appreciable antibody responses. However, those not on anti-metabolite maintenance immunosuppression were more likely to develop antibody responses. These results contrast dramatically with the robust early immunogenicity observed in mRNA vaccine trials. These findings are an important reminder that any individual with potential immune compromise should not assume they have achieved an immune response to the SARS-CoV-2 vaccine after a first dose.

Abstract# LB 8

Dd-cfdna Can Guide Safe Reintroduction of Immunosuppression in Kidney Transplant Recipients with Covid-19

J. Miles[1], J. Leonard[2], V. Tatapudi[2], M. Fei[1], R. Montgomery[2], N. M. Ali[2], *[1]CareDx, Brisbane, CA, [2]Transplant Institute, NYU Langone Health, New York, NY*

Purpose: COVID-19 infection is associated with 25% mortality in kidney transplant recipients (KTRs). Reduction of anti-metabolite immunosuppressants during the acute COVID-19 illness is a common approach in managing KTRs. This potentially increases the risk of allograft rejection in the setting of reduced immunosuppression. The optimal timing for safe reintroduction of immunosuppression remains unclear. Here we describe a novel approach of incorporating dd-cfDNA to safely titrate immunosuppression in patients with COVID-19.

Methods: KTRs were monitored prospectively with dd-cfDNA beginning at the time of COVID-19 diagnosis or on discharge from acute care. If dd-cfDNA<1%, antimetabolite dosing was increased by 25% every two weeks. If dd-cfDNA>1% or a rapid relative change from baseline, antimetabolites were reintroduced at full dose provided the patient remained symptom free from COVID-19.

Results: 58 KTRs (including 1 PAK) with COVID-19 infection were monitored with dd-cfDNA at the time of or following this diagnosis from March 2020 to January 2021. Demographics and directed treatments are summarized in Table 1. Median dd-cfDNA levels remained stable during longitudinal surveillance following COVID-19 (Figure 1A). 3/58 patients with COVID-19 and dd-cfDNA results available developed biopsy-proven rejection. One developed rejection at the time of COVID-19 diagnosis with elevated dd-cfDNA. 2/58 developed rejection in the setting of delayed re-introduction of antimetabolites due to clinical concerns (Figure 1B), however one did not have elevated dd-cfDNA. 10% of patients (n=6) had accelerated reintroduction of anti-metabolites due to dd-cfDNA levels>1% or rapid deviation from baseline. None of these patients developed rejection in the following months and dd-cfDNA levels decreased after immunosuppression reintroduction. Standard reintroduction of anti-metabolites with dd-cfDNA <1% was achieved with no associated episodes of rejection.

Conclusions: dd-cfDNA presents a feasible adjunctive biomarker to guide immunosuppression titration in KTRs with confirmed COVID-19 and avoid allograft rejection during a time of increased immunological risk.

Abstract# 249

Dna-pkcs Regulation of the Allogeneic Immune Response

L. Burdine, M. Burdine, Z. Waldrip, D. Harrison, *University of Arkansas, Little Rock, AR*

Purpose: Organ transplantation is life-saving and continued investigations into immunological mechanisms that drive organ rejection are needed to improve immunosuppression therapies and prevent graft failure. DNA-dependent protein kinase catalytic subunit, DNA-PKcs, is a critical component of both the cellular and humoral immune responses. In this study, we investigate the contribution of DNA-PKcs to allogeneic skin graft rejection to potentially highlight a novel strategy for inhibiting transplant rejection.

Methods: Fully MHC mismatched murine allogeneic skin graft studies were performed by transplanting skin from BalbC mice to C57bl6 mice and treating with either vehicle or the DNA-PKcs inhibitor NU7441. Graft rejection, cytokine production, immune cell infiltration, and donor-specific antibody (DSA) formation were analyzed.

Results: DNA-PKcs inhibition significantly reduced necrosis and extended graft survival compared to controls (mean survival 14 days vs 9 days respectively). Inhibition reduced the production of the cytokines Interleukin (IL)2, IL4, IL6, IL10, TNFα, and IFNγ and the infiltration of CD3+ lymphocytes into grafts. Furthermore, DNA-PKcs inhibition reduced the number of CD19+ B cells and CD19+ CD138+ plasma cells coinciding with a significant reduction in DSAs. At a molecular level, we determined that the immunosuppressive effects of DNA-PKcs inhibition were mediated, in part, via inhibition of NFκ B signaling through reduced expression of the p65 subunit.

Conclusions: Our data confirm that DNA-PKcs contributes to allogeneic graft rejection and highlight a novel immunological function for DNA-PKcs in the regulation of NFκ B and concomitant cytokine production.

Abstract# 250

P40 Homodimers Induce Il-15 to Promote Endogenous Donor-reactive Memory Cd8 T Cell Activation within High-risk Cardiac Allografts

H. Tsuda, A. Valujskikh, R. Fairchild, *Inflammation and Immunity, Cleveland Clinic, Cleveland, OH*

Purpose: Longer cold ischemic storage (CIS) time prior to transplant results in increased proliferation of endogenous donor-reactive memory CD8 T cells within complete MHC-mismatched cardiac allografts at 24 hrs after transplant and in enhanced effector functions to mediate CTLA-4Ig-resistant rejection of the high-risk allografts. This increased memory CD8 T cell proliferation within high-risk allografts requires CD4 T cell help via CD40-CD154 interactions with graft dendritic cell (DC)s to produce IL-12p40 homodimer (p40 HD) that is a key factor for driving the memory CD8 T cell proliferation.

Methods: Here, we investigated how p40HD stimulate endogenous memory CD8 T cell proliferation within high-risk allografts.

Results: When testing the impact of p40HD on cytokine production in the allografts, p40 HD injection into recipients of low-risk allografts induced marked increases in graft IL-15. Consistent with this, the longer CIS time increased mRNA expression of IL2Rα (CD25), IL2Rβ(CD122) and IL15Rα in purified CD8 T cells infiltrating the allografts on day 2 post-transplant and markedly increased IL-15 protein in the allografts. Blocking IL-15 signaling with anti-CD122 mAb inhibited endogenous memory CD8 T cell proliferation within high-risk allografts at 48 hrs after transplant and prolonged allograft survival in CTLA-4Ig conditioned recipients to that observed in CTLA-4Ig conditioned recipients of low-risk allografts. Moreover, anti-CD122 mAb inhibited p40HD induced memory CD8 T cell proliferation within low-risk allografts. To test the source of IL-15, we transplanted diphtheria toxin (DT) receptor-CD11c transgenic mice subjected to 8hr CIS into A/J recipients. Depletion of CD11c+ cells abrogated the p40HD-induced endogenous memory CD8 T cell proliferation and IL-15 production within low-risk allograft. To further test the role of allograft IL-15 signaling, we used B6.IL15Rα$^{-/-}$ as donors. Graft deficiency of IL-15Rα decreased the endogenous memory CD8 T cell proliferation within allografts at 48 hrs post-transplant and extended survival of grafts in CTLA-4Ig conditioned recipients.

Conclusions: These results indicate that p40 HD produced by graft DCs stimulate graft DCs to produce IL-15 that directly drives endogenous donor-reactive memory CD8 T cell proliferation to mediate CTLA-4 resistant rejection. The IL-15 mediated regulation of endogenous memory CD8 T cell may provide a new strategy to attenuate CTLA-4Ig resistant rejection mediated by these donor reactive T cells.

Abstract# 251

Contribution of T-bet Expressing CD27+ CD21- Activated Memory B Cells Poised for Plasma Cell Differentiation to Antibody-mediated Rejection of Kidney Transplants

K. Louis[1], E. Bailly[1], C. Macedo[1], B. Ramaswami[1], X. Gu[1], G. Chalasani[1], A. Zeevi[1], P. Randhawa[1], H. Singh[2], C. Lefaucheur[3], D. Metes[1], *[1]Surgery, University of Pittsburgh, Pittsburgh, PA, [2]Center for Systems immunology, Department of Immunology, University of Pittsburgh, Pittsburgh, PA, [3]Human Immunology and Immunopathology, INSERM U976, Paris, France*

Purpose: Alloimmunity triggered by donor-specific antibodies (DSAs) and ensuing development of antibody-mediated rejection (ABMR) are detrimental to organ transplants. Yet, the cellular states underlying B cell alloreactive responses and the molecular components controlling them remain unclear.

Methods: We used high dimensional B cell profiling in blood and tissue in a cohort of 96 kidney transplant recipients.

Results: We identified expanded clusters of CD27+CD21- activated memory (AM) and CD27-CD21- tissue-like memory (TLM) B cells that expressed the transcription factor T-bet in blood of patients who developed DSA and progressed to ABMR (DSA+ABMR+, N=20). AM and TLM cells were diminished in DSA+ABMR- (N=28) patients and at baseline levels in DSA- (N=48) patients. Unlike TLM cells that displayed cell exhaustion features, AM cells manifested elevated expression of IRF4 and Blimp1, and upon co-culture with autologous circulating T follicular helper (cTFH) cells differentiated into DSA-producing plasma cells in an IL-21 dependent manner. Comparative RNA-seq analysis of AM with TLM and resting memory B cells in patients undergoing ABMR revealed a distinctive transcriptional state and selective expression of *IGHV* sequences reflective of clonal expansion. The T-bet expressing AM cells preferentially accumulated in patients with severe ABMR and were correlated with increased frequency of activated cTFH cells, skewed generation of DSAs towards IgG3 isotypes and increased vascular lesions in kidney allografts. AM cells and their distinct molecular signatures were also detected within kidney allografts of patients undergoing ABMR.

Conclusions: This study suggests a pivotal role for T-bet expressing AM B cells in directing humoral alloimmune responses against organ transplants leading to ABMR and may represent an important therapeutic target.

Abstract# 252

Donor Mhc-independent Islet Rejection in Autoimmune Diabetes: Implications for Stem Cell Therapy

R. G. Gill[1], M. Coulombe[2], K. S. Beard[1], A. L. Burrack[3], *[1]University of Colorado, Aurora, CO, [2]Surgery, University of Colorado, Aurora, CO, [3]Mircrobiology and Immunology, University of Minnesota, Minneapolis, MN*

Purpose: Stem cell technology is an attractive approach for generating insulin-producing cells for transplantation in insulin-dependent diabetes and potentially can be genetically modified. One recent strategy is to eliminate donor MHC expression to avoid direct host T cell recognition of the donor. In this study we set out to determine whether MHC deficiency prevented islet allograft rejection in spontaneously autoimmune non-obese diabetic (NOD) mice.

Methods: Diabetic female NOD mice were grafted beneath the left renal capsule with islets from the following types of islet donors: 1) NOD scid donors (H-2g7),

2) NOD donors deficient in both MHC class I (beta $2m^{-/-}$) and class II ($C2Ta^{-/-}$), 3) wild-type C57Bl/6 (B6; H-2^{d}), and 4) B6 donors deficient in both MHC class I and class II ($I\text{-}A^{b-/-}$). After restoration of euglycemia, rejection was defined as the first of consecutive hyperglycemic readings. In the event of graft rejection, islet grafts were explanted and graft infiltrating cells (GIC) were cultured in 1L-15-containing media for three days and then antigen-stimulated to determine antigen specificity by ELISA (IFNg production).

Results: Syngeneic NOD islets rejected in 12/12 recipients (MTR of 12 days). Rejection was greatly dependent on NOD MHC expression; 9/12 MHC-deficient NOD islets survived more than 100 days. B6 islet allografts showed accelerated rejection; 14/14 B6 islet grafts rejected in less than 10 days. Interestingly, B6 MHC deficient islets *also* rejected in NOD recipients with 15/15 MHC-deficient B6islet rejecting in less than 20 days. B6 MHC deficient islets survived indefinitely in non-autoimmune-prone BALB/c recipients (greater than 100 days) indicating that MHC was required for conventional islet allograft rejection. Interestingly, GIC from rejecting B6 MHC-deficient demonstrated pronounced *alloreactivity* (IFNg production) to B6 MHC-deficient splenic stimulator cells. This alloreactivity required the presence of NOD APCs, suggesting 'indirect' (host APC-dependent) recognition. GIC from rejecting NOD islet grafts did not demonstrate reactivity to either B6 or B6 MHC-deficient splenic APCs, indicating that reactivity was specific to the islet donor.

Conclusions: While both disease recurrence and alloimmunity require islet MHC expression, islet allograft rejection in autoimmune recipients is donor MHC independent. We posit that underlying autoimmunity initiates an especially vigorous 'indirect' T cell alloresponse. As such, results suggest that abrogating donor MHC from allogeneic surrogate beta cell sources may not be sufficient to prevent rejection in autoimmune recipients. Rather, findings suggest that modified autologous stem cell sources may be effective at preventing islet rejection in the setting of autoimmunity.

Abstract# 253

Accelerated Bronchiolitis Obliterans After Lung Transplant Promoted by an ATG16L1 Mutation is Coupled to Mitochondrial Damage and Metabolic Alterations in Monocyte-derived Antigen Presenting Cells

M. Cano[1], D. Zhou[1], D. Kreisel[1], C. Chen[2], K. Pugh[1], D. Byers[1], R. Hachem[1], A. Gelman[1], *[1]Washington University, Saint Louis, MO, [2]UT Southwestern Medical Center, Dallas, TX*

Purpose: Bronchiolitis obliterans (BOS) remains a major cause of death for lung transplant recipients, and the mechanisms that drive BOS remain poorly understood. It is known that genetically encoded deficiencies in mitophagy, a specialized form of autophagy which targets the removal of damaged mitochondria, promote disease but it is unclear if they play a role in BOS. Prior work has shown that the rs2241880 mutation in ATG16L1, an autophagy related protein, leads to protein instability resulting in deficiency of ATG16L1 in monocyte-derived (Mo-cells) macrophages. We previously observed that human lung recipient carriers of rs2241880 had accelerated BOS. Therefore, we analyzed the effects of ATG16L1 deficiency in Mo-$CD11c^{+}$ cells in a mouse orthotopic lung transplant model of BOS.

Methods: CD11cCre$ATG16L1^{flox/flox}$ ($ATG16L1^{\Delta/\Delta}$) and control CD11cCre recipients received major MHC-mismatched FVB lungs, with immunosuppression to induce acceptance. Following induced epithelial injury, allografts were assessed for obliterative airway lesions for up to 28 days. Intragraft Mo-$CD11c^{+}$ cells were analyzed for bulk RNA sequencing and by FACS for mitochondrial mass and ROS production. Mitophagic flux was visualized by confocal microscopy using Mt-kiema mitophagy reporter mice. Metabolic activity was characterized using a Seahorse XF analyzer. Alloimmunity was examined via T cell proliferation assays and ELISA.

Results: $ATG16L1^{\Delta/\Delta}$ recipients showed severe and accelerated OB compared to controls. RNAseq analysis of $ATG16L1^{\Delta/\Delta}$ deficient intra-graft Mo-derived cells demonstrated a loss of transcripts that encode subunits of mitochondria electron complex I, II and V. Confocal and FACS revealed higher $MHCII^{+}$, attenuated mitophagic flux, high mitochondrial mass and elevated ROS production in $ATG16L1^{\Delta/\Delta}$. In line with these observations were decreased maximal mitochondrial respiratory capacity, lower mitochondrial ATP production and increased utilization of glycolysis; as well as increased T cell proliferation and higher IL1-β suggesting metabolic adaptation of an M1 inflammatory phenotype.

Conclusions: These data reveal a new role for ATG16L1 as a regulator of mitochondrial quality control and alloimmunity with implications for lung recipients that carry the ATG16L1 rs2241880 mutation.

Abstract# 254

Resolution of Endothelial Inflammation is Delayed Following IFNγ, Which Provokes a Long-lasting Pro-adhesive Phenotype Dependent on JAK/STAT Signaling

N. M. Valenzuela, *Pathology and Laboratory Medicine, UCLA, Los Angeles, CA*

Purpose: Although many cytokines are upregulated within allografts undergoing rejection, intragraft transcripts are dominated by IFN-response signatures. Resolution is a key phase of inflammation needed to reduce accumulation of immune cells at local sites, followed by restoration of normal function. Failure to attenuate this process leads to a detrimental, chronic response and maladaptive immunity that underlies many inflammatory diseases, including chronic allograft rejection. Blood endothelial cells (EC) actively regulate access of leukocytes to peripheral tissues and regulate egress in response to inflammatory insult. Much has been studied on the initiation of inflammation during endothelial activation, but less is known about the kinetics and mechanisms necessary for the return to a non-inflamed state.

Methods: We examined the profile, kinetics and contraction of type II endothelial activation by NFκB-driven TNFα and JAK/STAT-mediated IFNγ. Endothelial pro-adhesive phenotypes were compared under chronic cytokine stimulation (1-48hr), and upon short-term cytokine priming (3hr) followed by withdrawal (up to 48hr). We tested HMEC-1 and primary human endothelial cells from 6 different vascular beds. Endothelial activation was measured at the mRNA and protein levels by Nanostring, flow cytometry, ELISA and multiplex Luminex assays. JAK1/2 was inhibited with ruxolitinib (20nM-2μM).

Results: TNFα promoted early expression of E-selectin, VCAM-1, ICAM-1, and broad biphasic induction of chemokines. IFNγ upregulated ICAM-1, BST2 and a restricted set of CXCL chemokines. The dynamics of endothelial adhesive phenotype changes after withdrawal were also distinct. A small proportion of TNFα-induced endothelial phenotype changes persisted, but most other effects required continuous TNFα exposure for reinforcement. In contrast, the consequences of even short exposure (3hr) to IFNγ were long-lasting and broad, with sustained elevation of adhesion molecules and chemokines 48hr later. NFκB genes and target transcriptional changes were quickly down-regulated in the absence of TNFα, while JAK, STAT and IRF gene expression was durable, dependent on new transcription but independent of continuous IFNγ exposure. Finally, intact persistent JAK signaling in the endothelium was required to maintain a pro-adhesive phenotype after IFNγ withdrawal, which could be prevented by the JAK1/2 inhibitor ruxolitinib.

Conclusions: Our results reveal a sustained perturbation of endothelial function and pro-adhesive phenotype after exposure to IFNγ, mediated by JAK and dependent on new transcription. The resolution of endothelial-controlled inflammation may therefore be impaired or delayed under JAK conditions, but quiescence more readily re-established when perturbation was dependent on NFκB. JAK antagonism may therefore represent a novel therapeutic approach to dampening intragraft inflammation.

Abstract# 255

PD-1/PD-L1 Selectively Regulates Treg Lymphatic Migration

W. Piao[1], L. Li[1], C. Paluskievicz[1], Y. Zhang[2], V. Saxena[3], K. Hippen[2], B. Blazar[2], L. Riella[4], J. Bromberg[1], *[1]Surgery, U Maryland, Baltimore, MD, [2]U Minnesota, Minneapolis, MN, [3]U Maryland, Baltimore, MD, [4]Harvard U, Boston, MA*

Purpose: The molecules that regulate Treg migration are incompletely identified. Programmed death-1 (PD-1) and its ligand PD-L1 are immune checkpoint proteins which regulate immune cell responses. However, little is known about their functions in T cell migration. Activated Tregs express high levels of PD-1, and its ligand PD-L1 is highly expressed on lymphatic endothelial cells (LEC). Yet how Treg interact with LEC via PD-L1 has not been previously investigated. We tested the hypothesis that Treg PD-1 signals to LEC PD-L1 to regulate lymphatic transendothelial migration (TEM).

Methods: Human and murine dermal LECs were used in analyses of PD-L1 signaling. Purified human and murine naïve, activated, and regulatory CD4 T cells were migrated across LEC in vitro and lymphatic vessels in vivo. Recombinant PD-1 fused with IgG1 (PD-1 Fc) were used to induce PD-L1 signaling. Signaling was blocked with specific anti-PD-1 or anti-PD-L1 mAbs.

Results: Human and mouse Tregs had the highest PD-1 expression among T cell subsets. LEC expressed high levels of PD-L1. PD-1 deficiency or blocking PD-1 on Tregs with mAb inhibited in vitro and in vivo lymphatic migration but not non-Treg effector CD4 T cell migration. Treg migration to CCL19 was enhanced by PD-L1 Fc. Crosslinking LEC PD-L1 with PD-1 Fc induced phosphorylation of classical NFκB-p65, PI3K/Akt threonine 308 and extracellular signal-regulated kinase (ERK). Ligation of LEC PD-L1 with PD-1-Fc augmented VCAM-1 expression, which was inhibited by blocking NFκB-p65 but not ERK or PI3K/Akt signaling. Similar changes to LEC junctions were observed when PD-1-high expressing Treg migrated across LEC layers. Tregs also rapidly induced NFκB p65 translocation into the LEC nucleus. PD-1 Fc ligation of LEC PD-L1 also decreased VE-cadherin

expression, which was restored by blocking ERK and PI3K/Akt but not NFκB-p65 signaling. Blockade of LEC PD-L1 with anti-PD-L1 mAb inhibited Treg TEM. Importantly, Treg infiltration into melanoma was reduced by treating mice with anti-PD-1 blocking mAb.

Conclusions: Treg use PD-1/PD-L1 to regulate lymphatic transmigration. Treg PD-1 signals through ERKs and PI3K/Akt pathways to modulate VE-cadherin, and through classical NFκB p65 to regulate VCAM-1 expression on LEC. The modulated LEC structures uniquely affect only Treg but not non-Treg effector CD4 T cell TEM. These data demonstrate a novel role for Treg PD-1 and LEC PD-L1 in regulation of lymphatic migration and ultimately Treg suppressive function.

Abstract# 256

Ikaros-SIRT1 Signaling Axis Regulates Macrophage Polarization and Ischemia Reperfusion Injury in Mouse and Human Liver Transplantation

K. Kadono[1], H. Hirao[1], H. Kojima[1], K. J. Dery[1], X. Li[2], J. W. Kupiec-Weglinski[1], *[1]The Dumont-UCLA Transplant Center, Los Angeles, CA, [2]NIEHS, Durham, NC*

Purpose: Although Ikaros is a well-established transcriptional regulator of lymphopoiesis and differentiation of leukocyte lineage, its role in myeloid cells and ischemia reperfusion injury remain unclear. We have reported that the SIRT1 promotes homeostasis and hepatic rejuvenation in mouse and human liver transplantation. Whether SIRT1 signaling is essential in myeloid cell polarization remains uncertain, while the molecular communication between Ikaros and SIRT1 has not been studied.

Methods: To interrogate the significance of myeloid Ikaros-SIRT1 axis in the context of innate immune activation, comprehensive molecular and functional studies encompassing primary mouse macrophage cultures (siRNA-targeted under LPS/IL4 stimulation), in vivo mouse models of hepatic inflammation (liver warm ischemia-reperfusion injury in WT, myeloid-specific SIRT1-KO, and CD11b-DTR mouse systems), and analyses of human liver transplant patients (fifty-five clinical cases) were undertaken.

Results: Human LT biopsies were divided into two groups based on Ikaros gene levels (RT-PCR). As compared with the "low" expression group, the "high" Ikaros expressing LTs showed significantly higher sALT at POD1-4, gene expression of M1 markers but lower SIRT1 protein levels in post-transplant livers (n=55, $p<0.05$). Then, we employed mouse macrophage cultures to assess Ikaros function in innate-immune activation. Ikaros silencing (siRNA) in BMM decreased M1 but increased M2 markers, coinciding with enhanced SIRT1 activation. In contrast, Ikaros overexpression in BMM cultures increased M1 markers and diminished SIRT1, while macrophage-specific SIRT1 deficiency increased M1 but decreased M2 activation markers. mSIRT1-KO mice experienced exacerbated hepatic IRI, accompanied by up-regulated M1 markers (n=7, $p<0.05$). Depletion of CD11b+ cells suppressed Ikaros expression in IR-stressed livers while BMM reconstitution restored Ikaros levels, implying recruited macrophages were instrumental for hepatic Ikaros expression. Interestingly, reconstitution of CD11b-deficient mice with siRNA-Ikaros BMM ameliorated hepatic IRI with increased levels of SIRT1 and M2 markers as compared with siRNA-control BMM (n=6, $p<0.05$).

Conclusions: Our results identify Ikaros as a novel M1 macrophage activation marker and document the Ikaros - SIRT1 signaling axis as a mechanistic biomarker and putative checkpoint regulator of M1/M2 macrophage polarization, with divergent innate phenotypic signatures in sterile inflammation response in liver transplantation.

Lymphocyte Biology and Tolerance

Abstract# 257

Sequential Analysis of Renal Allograft Rejection at Single Cell Resolution

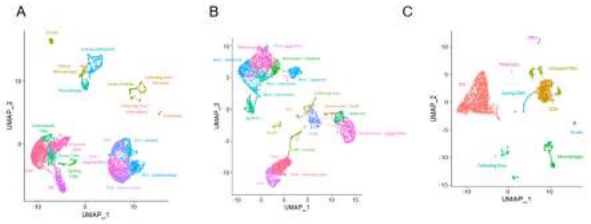
T. Shi[1], C. Castro-Rojas[1], A. Burg[1], K. Roskin[1], J. Rush[2], B. Haraldsson[2], A. Shields[3], R. Alloway[3], E. Woodle[3], D. Hildeman[1], *[1]Immunobiology, Cincinnati Children's Hospital Medical Center, Cincinnati, OH, [2]Novartis Pharmaceuticals AG, Basel, Switzerland, [3]University of Cincinnati Medical Center, Cincinnati, OH*

Purpose: Renal allograft anti-rejection therapies (corticosteroids (CCS) and anti-lymphocyte globulin) have been the primary treatment modalities for over six decades, yet little is known about their effects on graft infiltrating immune cells. Similarly, the understanding of rejection biology occurring under CNIs or new biologics is lacking. Here, we defined the transcriptomic profiles of kidney tissue and infiltrating immune cells and paired urine samples at the time of rejection and after anti-rejection therapy (RejTx).

Methods: Renal allograft recipients enrolled in a clinical trial of iscalimab, an anti-CD40 mAb, were followed longitudinally if they had rejection. Renal allograft biopsies and paired urine samples were collected at the initial rejection and after RejTx. 5' single cell RNA sequencing was performed with linked TCR sequencing and clonal analyses.

Results: One patient with a Banff 1B rejection underwent RejTx (CCS, CNI, MMF) and failed to resolve rejection, a process captured across 4 biopsies. Throughout the course of rejection, inflammatory signals in multiple cell types in the graft and urine were observed. The top 7 expanded CD8+ T cell clones persisted for weeks but were eventually displaced by a new set of expanded clones, even in the presence of ongoing rejection. In contrast, another patient followed over 2 biopsies experienced a Banff 1A rejection characterized by a similar inflammatory gene expression across multiple cell types and several expanded CD8+ T cell clones. In this patient, the top 7 expanded clones were all similarly diminished after RejTx. Thus, rejection reversal was associated with a decrease in inflammatory gene expression, but not a rapid change in expanded T cell clones in the graft. Ongoing work will further characterize differential gene expression across multiple cell types in ongoing rejection compared to resolving rejection.

Figure 1: UMAP of patient 1 biopsy (A) and urine (B) and patient 2 biopsy (C), integrated across timepoints.



Conclusions: 1) Refractory rejection under iscalimab is associated with failure to eliminate dominant TCR clones in the allograft and an emergence of new T cell clones, 2) urine and renal allograft biopsies display similar cell populations, including clonally dominant CD8+ T cells, 3) rejection reversal is associated with decreased inflammatory gene expression in kidney tissue and infiltrating immune cells.

Abstract# 258

LTβR Engagement Regulates Treg Migration, Stability and Suppressor Function

V. Saxena[1], W. Piao[1], L. Li[1], Y. Xiong[1], M. W. Shirkey[1], J. Iyyathurai[1], R. Lakhan[1], R. Abdi[2], J. Bromberg[1], *[1]U Maryland, Baltimore, MD, [2]Harvard U, Boston, MA*

Purpose: Regulatory T cell (Treg) lymphatic migration and maintenance of transcription factor Foxp3 expression are required for suppressor function and allograft protection. Treg stimulate lymphotoxin beta receptor (LTβR) on lymphatic endothelial cells (LEC). We tested the hypothesis that Treg-LEC engagement is necessary for Treg migration, sustaining Foxp3 expression, and suppressor function.

Methods: Treg stability, migration and function were analyzed in vivo in an islet allograft model, and in vitro in a transwell based LEC migration assay. Mice with deletion of lymphotoxin alpha ($LT\alpha^{-/-}$), $LT\beta R^{-/-}$, and $Prox1\text{-}Cre\text{-}ER^{T2+/-}LT\beta R^{fl/fl}$ (KO^{fl}) in which LTβR is depleted in LEC by tamoxifen treatment, were used.

Results: Treg differentiation and execution of suppressor function required sequential migration from the target tissue to the draining LN. Treg use LTα1β2 to stimulate LTβR on LEC for migration to LN via afferent lymphatics. Disruption of LTα1β2-LTβR interactions between Treg and LEC resulted in impaired islet allograft survival from 25d to 13d in KO^{fl} mice ($p<.03$), to 15d in $LT\beta R^{-/-}$ mice ($p<.03$), and to 13d in mice receiving $LT\alpha^{-/-}$ Treg ($p<.03$). Conditional or germline depletion of LTβR on LEC, or deletion of LTα on Treg, led to Treg retention in the graft and poor migration from tissues to the dLN. Non-migrating Tregs lost Foxp3 and CD25 expression to become exTreg. In a transwell based Treg-LEC co-culture assay, the non-migrating Treg became exTreg and lost Foxp3, CD25, CD39, GITR, and LTαβ expression while maintaining CD49b, CD73, and CTLA4 expression. Conversion to exTreg was accompanied by methylation at the Foxp3 locus and decreased suppressor function. Since LTβR stimulates the NFκB classical pathway to secrete IL-6, blockade of NFκB or neutralization of IL-6 prevented exTreg conversion. CD39 catalyzes adenosine production, and supplementation with adenosine also prevented exTreg conversion in an adenosine receptor 2A (A2AR) dependent manner.
